THE
GARDENERS' CHRONICLE

A Weekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL. L.—THIRD SERIES:

JULY TO DECEMBER, 1911.

LONDON:
41, WELLINGTON STREET, COVENT GARDEN, W.C.
1911.

INDEX OF CONTENTS.

JULY TO DECEMBER, 1911.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS, NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABBOTSBURY, the season at, 262
 Aberdeen and N. of Scotland College of Agriculture, 167, 260
 Aberdeen College Gardens, 391
 Aberdeen University, forestry degree at, 397
 Acanthosicyos horrida, fruit of, 458
 Acetylene gas refuse as manure, 478
 Acclimatisation, experiments in, 72
 Aciphylla squarrosa, 106
 Actinonema rosæ, 241
 Adenium obesum in India, 47
 Ægle sepiara, fruits of, 263
 Aeroplane, attempted shipment by, 31
 Africa, extra-tropical Orchids of, 150
 Agricultural club, Madresfield, 410
 Agricultural education, 340
 Agricultural research and the Development Fund, 42, 188, 378
 Agricultural returns, Great Britain, 259, 430; Ireland, 259
 Agriculture, Aberdeen and N. of England College of, 167, 260; changes at the Board of, 322; Rome International Institute of, 457
 Albinism in Sweet Peas, 140
 Aldenham House, Grapes at, 252
 Alexander, James, the late, 413
 Alkaloids, plant, 132
 Almond crossed with Peach, 437
 Alpine garden, 5, 270, 432; a miniature, lecture on, 360
 Alpine plants, European, 258
 Alps, botanising in the, 387, 409, 432, 452; Primulas of the European, 45, 132, 164, 201, 220
 Amaryllis (see Hippeastrum)
 America, education trains in, 152; notes from, 372, 410, 467; gardening employment in, 478; the Apple crop in, 437
 American florists, annual convention of, 190
 American "Gooseberries," 292
 American Gooseberry-mildew, 53; on Red Currant bushes, 473
 American Melons, 227
 Ammonia salts as fertilisers, 397
 Ampelopsis and pulmonary diseases, 262
 Anguloa uniflora eburnea, 163
 Antholyza paniculata, 242; A. p. major, 218
 Apiary, the, 29, 109, 149, 205, 223, 257, 305, 415
 Apple Cox's Orange Pippin, 81, 114, 409
 Apple crop, the, 27; in the United States of America, 437
 Apples affected by Rose canker, 71
 Apples and Pears submitted to R.H.S. for award, 323
 Apples and Pears, the ripening of wood in, 310
 Apples: Australian, 53; cider, 323; from Nova Scotia, 323; in Egypt, 259; preparing meadow-land for, 330; seedling, 293, 324, 341; self-pollinating, 73; the colouring of, 447, 476
 Apple sucker, remedies for the, 52
 Apple tree, a remarkable, 457
 Appointments from Kew, 225, 416
 Aquatic plants and the hot weather, 203
 Arachnanthe Lowii at Mundham Vicarage, Chichester, 186
 Arbor day at Sandgate, 339, 418
 Arts and handicraft exhibition, 306
 Ashbourne, Co. Cork, 315
 Asparagus beds, treatment of, 469
 Aster ericoides "Desire," 303

Asters, border, 366
 Australia, conditions for exporting Potatos to, 41, 340, 358
 Australian Apples, the trade in, 53
 Australian plants, 206
 Autumn cultivation, 318
 Autumn weather, 323

B

BACK to the hills, 387, 409, 432, 452, 474
 Bacterial disease of Potato in Ireland, 199
 Bacterial diseases of plants, 198
 Bacteriotoxins in the soil, 226
 Bain, Mr. Alexander, 341
 Ballyfin Gardens, Queen's County, Melons at, 73
 Bamboo garden, the, 334
 Bambusa fastuosa in a Reading garden, 308
 Banana "King of Thousands," 452
 Bank employees form a horticultural society, 339
 Battersea Park, Japanese dwarf trees at, 379; old English garden at, 397, 437
 Battle of flowers at the Crystal Palace, 52
 Beans, Broad, rust disease of, 151; Soya, British-raised, 324
 Bees, the management of, 29, 109, 149, 205, 223, 257, 305, 415
 Beetroot, Globe, a trial of, 160
 Begonias, origin of cultivated, 190
 Belladonna Lily, the, 294
 Belvedere, note from, 400
 Bignonia grandiflora, 227
 Bird migration, 116
 Birds and crops, essay on, 359
 Bisley, the gardens at, 123
 Bitter pit or fruit spot, 353
 Bitton, fruiting of plants at, 375
 Black Currants, rust of, 189; method of planting, 408
 Blasting tree stumps, American method of, 411, 440
 Board of Agriculture, changes at the, 322; leaflets, 52
 Boiler, which is the best? 60
 Bolus, Dr., the late, and the South African College, 32
 Bone manure for Ericas, 437
 Bonnier, Prof. Gaston (*Flore Complète de France, Suisse, et Belgique*), 439

BOOKS, NOTICES OF:—A Botanical Survey of the Galapagos Islands (*Alban Stewart*), 303; Alpine Plants of Europe, together with Cultural Hints (*H. Stuart Thompson*), 258; Among the Hills (*Reginald Farrer*), 439; Apples and Pears (*George Bunyard*), 46; Atlas des Orchidées Cultivées (*M. Julien Constantin*), 431; Australian Plants Suitable for Gardens, Parks, Timber Reserves, &c. (*W. R. Guilfoyle*), 206; Botanical Magazine, 31, 111, 171, 225, 307, 417; British Ferns (*Francis George Heath*), 83; British Rainfall for 1910 (*H. R. Mill*), 270; Deutschland's Obstsorten (*F. Müller, H. Grau, and O. Bissman*), 259; Die Feigenbäume Italiens (*A. Tschirch*), 267; Essais sur l'Histoire de Quelques Fleurs d'Ornement: Le Camellia (*M. Le Texnier*), 236; Floræ Libyæ Prodromus ou Catalogue Raisonné des Plantes de Tripolitaine (*E. Durand*) 46; Flore Complète de France, Suisse, et Belgique (*Professor Gaston Bonnier*), 439; How to Cook Vegetables (*C. Herman Senn*), 218; Icones Orchidearum Austro-Africanarum extratropi-

carum (*Dr. Henry Bolus*), 150; Icones Plantarum (*Sir William J. Hooker*), 152; Illustrations of New South Wales Plants (*J. H. Maiden*), 398; Jardinage, 358, 473; Journal of the Paris Chrysanthemum Committee, 358; La Vie Agricole et Rurale, 437; Le Chrysanthème, 437; Links with the Past in the Plant World (*A. G. Seward*), 467; Lilies (*A. Grove*), 5; Mendelism (*R. C. Punnett*), 373; New Zealand Plants and Their Story (*Dr. L. Cockayne*), 291; Orchid Gathering in the East (*Mrs. Talbot-Clifton*), 439; Orchid Review, 350; Orchid World, 189, 275, 437; Orchids for Amateurs (*C. Alwyn Harrison*), 236; Pilgrims to the Isles of Penance (*Mrs. Talbot-Clifton*), 439; Plant Life on Land (*F. O. Bower*), 101; Publications received, 11, 32, 92, 111, 173, 190, 225, 242, 260, 276, 292, 308, 358, 378, 393, 438, 459; Rhododendrons and Azaleas (*William Watson*), 72; R.H.S. Gardeners' Dairy for 1912 (*Rev. W. Wilks*), 377; Scottish Botanical Review, 432; Species Ruborum Monographiæ generis Rubi Prodromus (*Autore Wilhelm Olbers Focke*), 170; The Book of the English Oak (*Charles Hurst*), 125; The Bulb Book (*John Weathers*), 303; The Gladiolus (*Dr. W. Van Fleet*), 143; The Regent's Park and Primrose Hill (*A. D. Dunlop*), 150; Wheat Growing in Canada, the United States, and the Argentine (*W. P. Rutter*), 303

Botanical laboratories at Manchester University, 339
 Botany, the teaching of, 416
 Botrytis causing "die-back" of Gooseberries, 82
 Bower, F. O. (*Plant Life on Land*), 101
 Bowes Museum Park, the, 368
 Bowling green, treatment of a, 265
 Brambles of the world, the, 170
 British Association, 198, 226, 236
 British botanists, 10
 British gardens, some, 331, 350
 Budding Roses, 47
 Budd, James, the late, 393
 Buddleia variabilis as a standard, 53
 Bulbs destroyed by the Narcissus fly, 27
 Bulb show, R.H.S. spring, 206
 Bulbs, the cultivation of, in moss-fibre, 329; protecting, from mice, 386
 Bulgaria, plant collection in, 92
 Bunyard, George (*Apples and Pears*), 46
 Burbage, experiments at, 309
 Burnham Park, visit of R.H.S. committees to, 11
 Butterfly, the Cabbage, 170

C

CABBAGES, high prices for, 292
 Cæsalpinia pulcherrima, 380
 Calanthe Cooksoniæ, 350
 Calceolaria gloriosa, 291; C. Golden Glory, 225
 Calcium carbide refuse for garden purposes, 227

Callianthemum rutæfolium, 219, 262
 Camassia Leichtlinii, 122
 Cambridge University, forestry at, 417
 Camellia, history of the, 236
 Campanula acutangula, 220; C. lactiflora, 438; C. pyramidalis, 308
 Canada, census of trees in orchards in, 71; exportation of fruit from, 259; legislation regarding insect pests and diseases in, 21, 41; Peaches from, 151
 Canker of Roses affecting Apples, 71
 Carbon bisulphide for destroying rats, 208
 Carbon-dioxide as food for plants, 349, 392, 461
 Carlton Hill, Edinburgh, 341
 Carnation Lady Abington, 291
 Carnation "rust," 231
 Carnations, border, 475
 Cassia corymbosa flowering out-of-doors in a Ventnor garden, 399
 Catalpa, fruiting of the, 209
 Catalpas in the Arnold Arboretum, U.S.A., 24
 Catasetum seedlings at Belsize Court gardens, 163
 Cattle poisoned by Laburnum, 310
 Cattleya Mossiæ Duchess of Norfolk, 22; C. M. Queen of Sheba, 22
 Ceanothus as a bedding plant, 174
 Cedar of the Canadian swamps, 297
 Celery disease, 262, 310, 341, 399, 419, 441, 467
 Cereals, "left-handed and right-handed" leaves of, 309
 Ceropogia Sandersonii, 249
 Ceropogias, the culture of, 265

CERTIFICATED FRUITS AND VEGETABLES:—Apples: Charles Eyre, 212; Ellison Orange, 282; Sir John Thornycroft, 381; William Nicholson, 313; Blackberry King's Acre Berry, 58, 96; Onion Premier, 313; Peas: America, 58, 96; Bell's Premier, 58, 96; Eureka, 58, 96; King Edward, 58, 96; Matchless Marrowfat, 58, 96; The Caithness, 58, 96; The Cottager, 58, 96; Plums: Blackbird, 178; Coe's Violet, 313; Potatos: Balgowrie Seedling, 246; Erin's Queen, 246; Great Scott, 246; Scottish Prolific, 246; Tremendous, 246; Raspberries: Everlasting Feldbrummer, 246; Perpetual de Serriere, 246; Rouge Merveille, 246; Surpassé d'Automne, 246; Surpassé Fastolf, 246; Surpassé Merveille Rouge, 246; Strawberry Olympia, 19.

CERTIFICATED PLANTS:—Amaryllis Parkeri, 210; A. P. alba, 210; Anemone L'Unique, 59; Anthemis Mme. Sander, 31; Aster ericoides Profusion, 312; A. Novi-Belgii Amethyst, 312; Begonias: Acquisition, 342; Al-trincham Pink, 421; Exquisite, 342; Fascinator, 380; Glory of Cincinnati, 421; Her Majesty, 342; Lady Cromer, 215; Souvenir de République, 31; Berberis veruculosa, 312; Brasso-Cattleya Digbyano - Mossiæ "Holford's variety," 381; B.-C. Leucothæa, 381; Brunsdonna Sanderæ alba, 210; Buddleia officinalis, 461; Calanthe Cooksoniæ, 343; Campanula longistyla parviflora, 31; Cannas: Frau E. Kracht, 57; Hungaria, 230; Terra-cotta, 94; Tiercelet, 230; Carnations: Baroness de Bienen, 342; Bath's

- Premier, 421; Dora Blick, 57; Herbert Newman, 57; James Quinn, 57; King George, 57; Mrs. Andrew Brotherstone, 57; Mrs. Elliott Douglas, 57; Mrs. Wharton, 94; White Wonder, 210; Catasetum Cliftonii, 96; C. macrocarpum, 247; Cattleya Adula, 247; C. A. "Auburn House variety," 276; C. A. var. Maronii, 247; C. A. Ward's variety, 328; C. A. var. Mrs. Ward, 382; C. Armstrongæ "Ward's variety," 382; C. Ash-tonii alba, 343; C. Dupreana, 19; C. Empress Frederick var. Marlfieldensis, 328; C. Ena Morton's var., 328; C. exquisita, 328; C. Fabia var. "gigantea," 403; C. F. var. "Imperator," 402; C. F. var. Prince John, 382; C. Gaskelliana var. Delight, 276; C. Germania, 276; C. Gildenii, 443; C. Hardyana var. enfieldensis, 276; C. highburyensis var. "Mary McCartney," 328; C. Holdenia, 403; C. iridescens var. Cuprea, 247; C. Iris var. "Cæsar," 276; C. I. var. "Corianda," 402; C. I. var. "Golden Queen," 276; C. I. var. "G. Weatherby," 276; C. I. var. "Ixion," 276; C. I. St. Giles, 247; C. I. Ward's var., 247; C. labiata, 403; C. l. albanescens, 443; C. l. alba, "Holden's" var., 403; C. l. alba, "Mme. le Doux," 328; C. l. alba var. Richard le Doux," 382; C. l. Empress Frederick, 313; C. l. "exquisita," 313; C. l. "Genevieve," 402; C. l. var. Hélène, 382; C. l. leucochila, 313; C. l. var. Lord Rothschild's delicata, 313; C. l. var. Virgin Queen, 443; C. l. var. "Virgo Purissima," 402; C. l. var. W. R. Lee, 313, 382; C. Mrs. Frank Hurdell, 443; C. Mrs. Frederick Sassoon, 246; C. Mossia alba var. Queen Mary, 19; C. O'Brieniana alba, 443; C. × Myrrha "Lee's variety," 402; C. Portia var. "Imperator," 402; C. Princess Mary, 403; C. Rhoda var. illuminata, 137; C. Roehrsiana Ashworth's variety, 443; C. St. Gothard, 276; C. suavior, 328; C. Thurgoodiana "Wivelsfield variety," 328; C. T. var. nobilior, 247; C. Venus lutescens, 343; C. Williamsii, 382; Chrysanthemums: Bronze Goacher, 312; Caterham Bronze, 327; Celia, 327; Charles Dickens, 327; Coronation, 313; Cranford Yellow, 282; Dorothy Dann, 312; Gertrude Peers, 313; Godfrey's Perfection, 380; Golden Cap, 342; Golden King, 342; Heston Bronze, 327; Isabel Gray, 421; Josephine, 380; Lorbury Yellow, 380; Mme. A. Nonin, 313; Margery Lloyd, 380; Merstham Gem, 380; Miss Margaret Gray, 380; Miss Margaret Walker, 327; Miss Phyllis Bryant, 380; Miss Venetia Hartmann, 313; Mrs. Andrew Walker, 327, 342; Mrs. David Lyme, 421; Mrs. John Peed, 327; Mrs. Percy E. Wiseman, 327; Mrs. Walter Hemus, 380; Mrs. W. Garnier, 313; Mrs. W. Hookey, 313; Percy Arnold, 342; Primrose Girl, 380; R. P. Burge, 327; Surprise, 313; Thomas Page, 380; Thoupe's Terra-cotta, 313; Walter Parsons, 313; Wonder, 313; Yvette Richardson, 313; Cimicifuga simplex, 313; Clerodendron Fargesii, 312; Colchicum speciosum album, 247; Cornus paucinervis, 94; Cypripedium Actæus "Cringewood" variety, 403; C. A. Durbar, 462; C. A. "Ward's" variety, 382; C. A. Westgate variety, 276; C. Alcibiades Ward's variety, 443; C. Arthurianum var. "Sanderæ," 402; C. Bonar Law, 443; C. Chapmanii "Westonbirt" variety, 381; C. Charlesianum var. "Prometheus," 402; C. Corneyanum var. Marie Louise, 443; C. Curtisii × vexillarium, 276; C. Draco "Westonbirt" variety, 422; C. Elatior "The Shrubbery" variety, 381; C. Euryades × Parkerianum, 276; C. Grittleton, 382; C. hitchensæ giganteum, 443; C. hybrid, 443; C. insignæ Gatton Park variety, 462; C. James Renwick, 443; C. Leeannum var. Mona, 443; C. Lord Ossulston var. Cherubicum, 328; C. Lord Wolmer Westonbirt variety, 462; C. Lucifer, 282; C. magnificum, 443; C. Mancunium, 403; C. Mrs. Alice Walmsley, 443; C. Our King, 443; C. Overtonii, 402; C. Pearl Beauty, 402; C. Perfection "Ward's" variety, 382; C. Pyrrha "Thompson's" variety, 382; C. Royal George, 282; C. Royal Sovereign, 462; C. Sanctæus Craven's variety, 313; C. Seymouræ, 443; C. Sibyl superbum, 343; C. Spicerianum × Thompsonii, 382; C. Thogun, 328; C. westgatense, 328; C. Zethus, 328; Dahlias: Amos Perry, 276; A. Normene, 276; Balmoral, 313; Brentwood Yellow, 282; Bridesmaid, 176; Conquest, 230; Crystal, 230; Decorative, 276; Delice, 312; Diadem, 247, 313; Dr. Hogg, 276; Effective, 276; Ethel May, 276; Evelyn Jackson, 276; F. Grinstead, 276; Florrie Wells, 247; Frederick Wenham, 247; Geisha, 276; Glen-ton, 276; Gloire Lyonnaise, 276; Golden Wave, 244, 247; Golden West, 276; H. Tarne, 276; Holy-rod, 215; Kaiserin Augusta Victoria, 276; Killarney, 176; Le Grand Maniton, 276; Leitstern, 248; Mme. J. Coissard, 276; Mme. Porrier, 276; Madhi, 244, 247; Maurice Rivoire, 210, 214; Miss Stredwick, 214; Mons. Hugonard, 276; Mr. E. D. Till, 276; Mrs. Stephens, 176; Mrs. W. C. Jackson, 276; Negro, 276; Papa Charmet, 276; Phenomane, 276; Prince de Venosa, 244; Princess Louise, 313; Queen of the Mauves, 244; South Pole, 276; Souvenir de Chanbanne, 276; Stability, 244; Sunlight, 247; The Czar, 313; The Imp, 230; Turtle Dove, 176; Union Jack, 210; Uranus, 214, 244; White Cloud, 276; Windsor, 313; Dendrobium Phalenopsis Colmanii, 247; D. P. Schröderianum var. "Miranda," 328; D. Victoria Regina, 57; Dracæna deremensis Warneckii, 17; Epidendrum Laucheanum, 246; Eremurus Olgae alba, 57; Fokienia Hodginsii, 57; Gladioli: Electra, 118; Europa, 230; "Ivorine," 118; Lieberfeuer, 230; Niagara, 230; Hohen-zollern, 118; James William Kelway, 60; Meteor, 118; "Golden West," 118; "Willy Wigman," 118; nanus Queen Mary, 17; Yellow Beauty, 176; Gloxinia Goliath, 31; Gongora leucochila; Houletia Wallisii, 177; Hibiscus syriacus "Snowdrift," 176; Hydrangea hortensis var., 31; Iris anglica Alexandre Dumas, 59; I. hispanica Amethyst, 59; I. Kämpferi Wasaka, 59; Itea ilicifolia, 95; Lælia Bella, 382; L. tenejalis, 247; Lælio-Cattleya Captain Starkie, 443; L.-C. Clive "Plumpton Hall" variety, 402; L.-C. Danganii, 381; L.-C. Lily, 328; L.-C. luminosa aurea, 312; L.-C. Maqueda, 247; L.-C. Martinetii var. King George V., 19; L.-C. Nella, 462; L.-C. Prince of Orange, 381; L.-C. Rubens var. magnifica, 247; L.-C. THE MARKET FRUIT GARDEN.

THE PROLONGED DROUGHT.

IN the period between May 3 and June 16 the rainfall in my district amounted to only 0.24 in. Not one of the numerous thunderstorms which occurred during the period visited this district, though two or three slight ones were felt a few miles away. As a rule, they appear to have missed the principal fruit districts, where they were urgently needed. The injury done by the drought is incalculable, most of it being quite irreparable by the bounteous rainfall which followed. The Strawberry crop, where the plants are cultivated upon too large a scale for watering to be attempted, was reduced to meagre dimensions, the plants on some soils being almost scorched before they had matured half their fruits that an abundant amount of blossom had set. The yellowing and dropping of Plums became worse and worse, Cherries dropped freely, a very large proportion of the Apple blossom failed to set fruit, and both Black and Red Currants began to colour before they had attained to their full size. It

is to be hoped that the rain came soon enough to save Raspberries from depreciation approaching the ruin of the crop, though some loss is inevitable.

APHIDES AND RED SPIDER.

It is well known that the aphid attack on Plums and Apples has been one of the worst experienced, and that the injury it has done is enormous. To what extent the loss of fruit is attributable to drought alone, and what proportion to aphides, cannot be determined. But there is another pest of which very little has been heard in relation to these trees, although it is accountable either alone or in combination with the aphid and the drought for the dingy appearance of much of the foliage of Plums and Apples. I refer to red spider, which I have never before seen on out-door fruit to anything like the extent prevalent this season. The drought was most favourable to this pest, which does not flourish under damp conditions. In my case its attack is much worse on Plums than on Apples. The under-sides of leaves of Plums and some varieties of Apples were thickly covered with this pest in the early part of June, and there was a good deal of defoliation in consequence of the attack before the end of that month. The only out-door fruit commonly supposed to be adversely affected by red spider is the Gooseberry.

ABORTIVE APPLE BLOSSOM.

Last season the extensive failure of the Apple blossoms to set fruit was attributed to a lack of sunshine and warmth in the summer of 1909, causing unripened fruit spurs. Possibly the same cause is partly accountable for the like, though less general, failure of the present season, as the summer of 1910 was as cold and sunless as that of 1909. In support of this theory is the fact that the failure on young trees, which needed more sunshine to ripen their fruit spurs, in consequence of their vigorous wood growth, than mature trees, is much the more common in my plantations. The yield of most varieties, planted five years ago in some cases and six years in others, in spite of abundant blossoming, will be extremely disappointing, whereas there is quite an average crop on mature trees. On the other hand, as evidence that the failure may be attributed mainly to drought and insect attacks, there is the fact that early blossoming varieties, which set their fruit before the full severity of the drought and aphid attack was reached, have a much better show of fruit than the late bloomers. In some reports the failure is attributed to injury arising from the Apple sucker; but this was certainly not the cause in my case, as I had not at all a bad infestation of this pest, and it was dealt with effectually by spraying just before the blossom opened, and where necessary a second time after the fall of the petals.

THE FRUIT HARVEST.

As already indicated, the Strawberry crop was a partial failure, and a scarcity of Gooseberries was indicated by high

prices. Almost all accounts describe the Black Currant crop as a very short one, while Red and White Currants appear to be full crops. Cherries and Pears failed badly on the whole. Plums and Apples vary greatly in different districts, and even in different orchards in the same district. On the whole, Plums may possibly amount to three-fourths of an average yield, notwithstanding the dropping of many fruits. This estimate is, however, doubtful, as much fruit which promised to mature, some of it nearly half-size at the time of writing, is being knocked off by the rains. The Apple crop appears to be much below the average in Kent and in some other Apple-growing counties, and it is doubtful if it will reach average dimensions in the country as a whole. The drought caused much of the fruit to colour prematurely, but whether the rainfall came in time to remedy this remains to be seen.

THE SEASON AND YOUNG TREES.

In the case of both Apple and Plum trees planted last winter, the drought and aphid attack were very destructive, the drought preventing the trees from growing strongly and overcoming the pest. An early aphid attack did much injury to a field of Apples planted in the winter of 1909-10; but by means of two sprayings and stripping off the curled leaves the injury was much mitigated. The greatest damage has been done to Beauty of Bath Apples, planted in 1908-9. This variety is especially subject to aphid, and the effect of the attack upon it, in spite of two sprayings, is very pronounced. Many of the young trees, which were pictures of vigorous growth in the spring, had all their shoots covered with tightly-curved leaves before the end of June, while others were partially affected in a like manner. Those which suffered most can never form good trees, in my opinion, and it may be necessary to dig them up, and plant new trees, or graft them afresh. The masses of curled leaves have been stripped off the shoots by hand and thoroughly crushed, as this plan was found beneficial in the summer of 1909; and in some cases the stripped part has been cut back to a sound bud by way of experiment. Worcester Pearmain is also much injured, and other varieties have suffered to a less extent.

POLLINATION.

It is strange that fruit growers should have had to wait till the year 1911 to see the question of the pollination of orchard trees made a prominent subject. Ever since market fruit-growing became extensively practised in this country, Apples and Plums of the same varieties have been grown in large blocks, and this has been the case also in nurseries. There have been, therefore, abundant opportunities of observing which varieties are not self-fertile, but need the pollen of some other variety to set the blossoms. We are now told that we should not plant more than two or three rows of any variety of the Apple without a break, and this is also true in the case of a few kinds

of Plums. But this is very inconvenient on large plantations, in relation particularly to spraying, thinning the fruits, and gathering them, because different varieties require different treatment or different times for treatment, and the employes are often unable to distinguish varieties, so that constant supervision would be needed if the recommendation were adopted. A list of self-pollinating varieties of Apples and Plums would be very valuable. I have several blocks of five to eight rows of the same Apples in

Jubilee, which is not in blossom until Lord Grosvenor has finished flowering, and there are four rows of the former, 12 feet apart, there are 216 feet between the last row of Lord Grosvenor and Golden Spire, the nearest Apple of any use for pollinating purposes. Royal Jubilee also must be self-fertile, as it is not in full blossom until every other variety that I grow has passed that stage, and yet it fruits well in some seasons. In a plantation, too young to test fruitfulness, as the rows are very short, there

FIG. 1.—SCHIZANDRA CHINENSIS: FLOWERS ROSE-COLOURED.

mature or nearly mature plantations, and I have not seen any case of failure to fruit. Cox's Orange Pippin is reported to be not self-fertile; but I have two blocks of eight rows of that variety, and the fruit is set in the middles of both blocks as freely as on the outsides. Lord Grosvenor must be self-pollinative, as I have 14 rows, where a field narrows into a corner of that variety in one block, with no fruit trees on one side of the block. The last row is 168 feet from any other variety of Apple, and, as the nearest is Royal

are 13 rows of Beauty of Bath, 14 of Worcester Pearmain, and 12 of Allington Pippin in solid blocks. Unless these are all self-pollinating, they, or at least one of them, will teach a lesson. Among Plums, Black Diamond is said to be not self-fertile. That seems to me probable, as I have a number of trees of this variety planted between Apples, and quite distant from any other Plums, and there is not a fruit on one of them. Other varieties no older are bearing a few fruits. A Southern Grower.

SCHIZANDRA CHINENSIS.

SCHIZANDRA CHINENSIS (see fig. 1) is a native of China and Japan, and was introduced to England in 1860. In a wild state the plant climbs over trees to a height of 20 or 30 feet. The long, reddish, slender branches are clothed rather sparsely the first year with obovate or oval leaves 2 to 4 inches long, remotely and finely toothed, and glabrous except for scurfy down on the veins beneath. On the year-old branches the leaves are crowded on short shoots, at the base of which the flowers appear in April. They are $\frac{1}{2}$ to $\frac{3}{4}$ inch in diameter, solitary, on slender stalks about 1 inch in length; the sepals and petals, about nine in number, are similar, being rose-coloured, very much cupped and incurved. The fruits are more attractive than the flowers. The portion of the flower bearing the carpels becomes elongated after fertilisation takes place, becoming ultimately 2 to 6 inches long, and bearing scarlet berries in a sort of spike. This remarkable elongation of the ovary-bearing part is characteristic of the genus. The berries remain for a long time on the plant.

The genus belongs to the Magnoliaceæ, and *S. chinensis*, in common with most members of this order, is strongly fragrant. Not only are the flowers sweetly scented, but the wood itself, especially when dried, has a pleasant, spicy perfume. Recent exploration in China has added several new species to collections, and some of them are very promising. One of the most interesting is known as *S. Henryi* (see fig. 55 in *Gardeners' Chronicle*, August 26, 1905), introduced by Mr. E. H. Wilson from Central China, and now growing in the Coombe Wood Nursery of Messrs. James Veitch & Sons. On the whole, the genus is, both for interest and beauty, worthy of more notice from planters than it has hitherto received. For the opportunity of figuring *S. chinensis* we are indebted to Mr. T. Smith, of Daisy Hill Nursery, Newry.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MESSRS. J. & A. A. McBEAN'S NURSERY.

MANY years ago, Mr. A. A. McBean made a special study of *Odontoglossum crispum*, its habits and requirements, and proved the value of this beautiful Orchid as a decorative plant and a subject for furnishing cut blooms. In the original block of three large, span-roofed houses, each more than 100 feet in length and loftier than most cool Orchid houses, the plants were grown to perfection, and Mr. McBean set the standard of excellence in *Odontoglossum* culture. From the commencement until now the Cooks-bridge Orchids have progressed, and this season the three large houses throughout the whole of the month of May and early June have been filled with flowers of *Odontoglossum crispum*. In point of vigour the plants are remarkable, possessing large, shiny bulbs, thick, fleshy leaves and stout flower-spikes, carrying from 12 to 20 or more grand white flowers, some of them tinged with pink and often with the backs of the petals purple. Some of the finest blotched varieties of *Odontoglossum crispum*, as for example *O. crispum* Mrs. J. McBean, have been flowered in this nursery, though the leaning of Mr. McBean is towards exceptionally fine white or sparsely-spotted typical forms. The finer novelties of this class are said to be rarer than those of the blotched forms. A white flower of thick substance and exceptionally fine form, having an occasional purple spot on the sepals, was seen on the occasion of my visit. *O. crispum virginale* is a wholly white variety, with a fine crimped labellum, whilst *O. crispum* Snow Queen is another chastely-beautiful flower. There were also some forms of *O. ardentissimum*, showing all the variations

seen in *O. crispum*, from heavily-blotched, to pure white blooms. At the end of one of the houses was a group which included *Odontoglossum Thompsonianum*, *O. Clytie*, and other hybrids of *O. Edwardii*, with scarlet *Odontiodas*, *Cochliodas*, *Odontoglossum amabile*, *O. harvengtense*, and other choice Orchids. In the smaller houses was a general collection of *Odontoglossums* flourishing equally as well as the plants of *O. crispum* and blooming freely. Of *O. Harryanum* there were some fine dark forms in bloom, and several plants of *O. luteo-purpureum* had many branched spikes, each bearing a large number of flowers. The side stages of some of these houses were filled with hybrid *Odontoglossums* of carefully-selected parentage, *Odontiodas*, numbers of *Brasso-Cattleyas*, hybrid *Cattleyas*, and *Lælio-Cattleyas*, a goodly proportion of the plants of each section approaching the flowering stage. In one large house was a collection of *Cymbidium* hybrids, one side being entirely filled with crosses of *Cymbidium insigne* (*Sanderi*). Every available kind of *Cymbidium* has been used for hybridising with *C. insigne*, but it is curious to note how the influence of *C. insigne* shows strongly in the ornamental growth of all the hybrids, and probably the features of this parent will be seen in the flowers as well.

In the *Cattleya* and *Lælia* houses there were grand displays of *C. Mendelii* and *C. Mossiæ*, the strains representing exceptionally fine qualities. Of the coloured forms of *C. Mendelii*, the variety *Pearl McBean* is one of the finest and has the best-coloured flowers, whilst of the light varieties the pure-white *C. Mendelii Memoria James McBean* is fine both in size and form. Of *Cattleya Mossiæ* several white forms of the *Reineckiana* and *Wagneri* class were in bloom; also *C. Mossiæ Aureola*, a bluish-white variety with a remarkable arrangement of deep golden-yellow in its broad labellum. Amongst a collection of *C. Lawrenceana* was a specimen with eight flowers on a spike, and both the *Cattleyas* and *Lælia purpurata* displayed the same floriferous character as the *Odontoglossums*. Several plants of *Miltonia vexillaria* had nine flowers on a spike.

A glance at the contents of the other houses revealed some fine specimens of the white *Dendrobium Dearei* with a few plants of the allied *D. Sanderæ* in bloom; a number of darkly-coloured forms of *Cypripedium bellatulum*, with others of *C. callosum Sanderæ*, *C. Maudslayi*; a large quantity of *Brassavola Digbyana* crosses, some being in bloom; *Lælio-Cattleyas* in great variety, also *L.-C. callistoglossa*, *L.-C. Fascinator*, and *L.-C. Aphrodite*. *Miltonia Phalænopsis* thrives remarkably well in this nursery; one plant observed had about 20 of the pretty white and rose-coloured flowers; *Cattleya Skinneri*, of the large-flowered old type, and its pure-white variety; *C. Dusseldorfei Undine*, one of the best white hybrids; profusely-flowered plants of *Oncidium macranthum* which, with the purple-flowered *Odontoglossum Edwardii*, the scarlet *Cochlioda Noezliana*, and *Sophranitis grandiflora*, are grown at Cooksbridge under as cool conditions as possible.

A house filled with the best varieties of *Lælia anceps*, all the plants being in fine health; another of seedling *Odontoglossums*, together with the smaller plants of rare blotched forms of *O. crispum*; numerous crosses of *Cochlioda Noezliana* and *Odontoglossum Edwardii*, and combinations between *Ada aurantiaca* and *Odontoglossum Edwardii*, were all interesting.

Among the *Odontiodas* in flower, *O. Charlesworthii* stood out as the finest in colour, with *O. Bradshawii* and *O. Vuylstekeæ* next in beauty. It was interesting to observe in the seedling *Odontoglossums* and *Odontiodas* in their early stages the extraordinary size of the first and second pseudo-bulbs, due to good cultivation. In the earlier days of Orchid hybridisation such results were only obtained after several years, with the risks of failure during the progress of development extending over a lengthy period.

The large ranges of *Odontoglossum* houses at Messrs. McBean's, filled from end to end with plants possessing marvellously fine pseudo-bulbs, disproves the belief formerly held that large pseudo-bulbs were incapable of producing fine spikes and good flowers. B.

THE ROSARY.

THE PREPARATION OF ROSES FOR EXHIBITION.—I.*

IN growing Roses for exhibition, a start must be made as soon as the growths are about 4 inches long. To obtain good flowers, the plants must then be thinned of all weakly shoots, and only about three or four of the strongest allowed to grow. Some varieties, such as Mrs. John Laing (H.P.), Caroline Testout (H.T.), and Maman Cochet (Tea) will carry flowers well, whilst others, like Capt. Hayward, K. A. Victoria, and Mme. Hoste, will only perfect two or three blooms. The shoots, as time goes on, must be carefully searched both night and morning for maggots, which will cause much damage and loss of flower-buds if they are allowed to go unchecked. When the flower-buds appear, the side buds must be removed, and the centre one, provided it is a good shape and quite free from any insect damage, only allowed to remain. At the same time, all side shoots must be pinched off, as well as any which are showing at the base. When the calyx of the bud splits it will be necessary to shade the blooms. Roses do not like damp or rain, neither do they like too much sunshine, especially the dark-coloured varieties. There are several "shades" on the market, but all are rather expensive. The best is West's "Acme," sold at about 9s. per dozen. If one has only a few Roses, it is quite easy to contrive a makeshift shade with a piece of wood and calico. Its construction is very simple. Having taken a piece of cube sugar box, about a foot long and 6 or 7 inches wide, the piece of calico is tacked round, then bore a hole in the board near one end, through which a Bamboo cane is inserted. Old straw hats placed on sticks make good shades, but they are not lasting, and none is so good as West's "Acme." Buds can also be protected by placing paper cones on them, but paper protection is of no use in wet weather. The long, high-centred blooms seen in the show boxes at exhibitions are a trifle, so to speak, artificial. They have received the aid of a little tie of double Berlin wool. The process is a quite simple one: when the flower is a quarter open, the outer row of petals is pressed back, and the centre loosely bound with a piece of wool, the ends being twisted twice, but not tied in a knot. The shade is again put over the flower, and, the bloom is ready for the show box in a day or two, according to the variety and the weather. Some varieties are more fleeting than others. For instance, Mildred Grant will last a week, while Frau Karl Druschki will only last a day; but the Rose cultivator soon gets to know the good and bad habits of the respective varieties. When once a tie is put on a Rose it should not be removed until staged at the show. The wool stretches as the flower expands. The tying of blooms retards their opening, and they expand very quickly when it is removed. There is a diversity of opinion as to the best time for cutting the flowers. I prefer to cut them at about six o'clock on the evening before the show, put the stems into water and store them in a dark, cool place. Blooms that are not sufficiently opened may be cut the following morning; but blooms cut

overnight stand up better the next-day. The boxes should be arranged before the exhibitor leaves home, and he should take care to put the largest blooms in the back row, the better specimens at the corners, the next size in the second row, and the smaller in the front. All the surplus blooms should be taken for "spares." If the weather is hot, a small piece of ice placed in the moss will help to keep the blooms fresh; but the lid of the box must be raised, or moisture will generate and the flowers become spotted and lose colour. When the blooms are arranged, the exhibitor should not hold a private view at home. He must remember the blooms are for exhibition, and the exhibition is the place for his friends to inspect them. When the flowers reach the show, he should just peep into the box to see that they are all right, find the place allotted to him, and set his boxes in position. He will probably find that several competitors are already busy arranging their flowers. After ascertaining when the tent is to be cleared, and after raising the lid of the box, the Roses should be left untouched. If he wanders quietly round and watches others arranging their blooms, he will notice a camel-hair brush is much in evidence for pressing down the outer petals of first this and then that Rose. Now, if he watches closely, he will find that the Roses are really being spoiled. After having taken stock of his opponents' blooms, he should complete the arrangement of his own, removing any doubtful blooms and replacing with "spares." The ties should not be removed until it is necessary, always leaving the thin blooms until the last. The ties should be cut with scissors. A camel-hair brush may now be employed to gently press out the outer petals of the blooms; to what extent can only be learned from observation. One or two spare blooms should be kept ready in case a replacement is needed at the last minute, and care should be taken not to put duplicates in the show box. It is from the winning stand that one is able to learn what an exhibition Rose ought to be, and it has only been by careful study of many exhibits that cultivators have become successful exhibitors. Any remarks on exhibition Roses would be incomplete without reference to the best varieties for an amateur possessing only a small garden. The man who grows a few Roses wants those that flower and grow well year after year. It is a mistake to attempt to grow a great number of varieties; rather grow a few varieties that are constant, and have a number of plants of each, dividing them up between H.P.'s, H.T.'s, and T's. If I were growing, say, 200 plants, I should select 24 varieties, 8 plants of each of the following sorts:—H.P.'s: Frau Karl Druschki, Mrs. John Laing, Ulrich Brunner, Captain Hayward, Hugh Dickson, A. K. Williams, Susanne Marie Rodocanachi, Her Majesty, Alfred Colomb. H.T.'s: Caroline Testout, Marquise Litta, K. A. Victoria, Mme. Mélanie Soupert, Mrs. Theodore Roosevelt, Dean Hole, Florence Pemberton, Lady Ashtown, The Lyon Rose. Teas: Maman Cochet, White Maman Cochet, Medea, Mme. Constant Soupert, Mme. Jules Gravereaux, and Molly Sharman Crawford. These would provide sufficient plants for an amateur to show well in small classes. There are, of course, other beautiful Roses, but, unfortunately, many of them must be avoided by anyone who grows cut-back plants, as they can only be relied on to produce good blooms in the first year and but rarely afterwards. This is a pity, for amongst them are some of our finest Roses, such as Mildred Grant, Bessie Brown, Mrs. W. J. Grant, Wm. Shean, Gustave Piganeau, Horace Vernet, Ulster, White Lady, Alice Lindsell, Helen Keller, Prince Arthur, Countess of Caledon, Lady Mary Fitzwilliam, and amongst the Teas, the Mermet tribe, Elise Varden, Cleopatra, and Mrs. Edward Mawley. In a word, the small exhibitor should grow the reliable sorts, and leave those alone that only give chance blooms occasionally.

* A paper read by Mr. Courtney Page at the annual general meeting of the Potters Bar and District Amateur Rose Society.

PREPARATION OF ROSES FOR EXHIBITION—II.

DECORATIVE ROSES.*

I, too, propose to deal with the preparation of Roses for exhibition, but I shall take the section generally known as decorative Roses. To be accurate, perhaps, each separate class in the section should have slightly different treatment; but, for the purpose of discussion, I shall take three classes:—(1) Roses to be shown in single vases or bowls, of the type of Mme. Abel Chatenay, Richmond, and Lady Ashtown; (2) Roses shown more or less in bunches, as in a class for six vases of decorative Roses; (3) single Roses and Briars.

(1) My first class of Roses, in order to be shown at their best, require nearly as much preparation as exhibition Roses shown in boxes. At least a fair proportion of the flowers intended to be shown should, if possible, be cut with long stalks, with a single flower, perhaps with a bud also, at the end of the stalk. I am not an advocate of wiring Roses when it can be avoided; perhaps I am even a little prejudiced

other quality, and in showing Roses of this class it is most important. We can, however, seldom protect these Roses on the plant in the way we can exhibition blooms, and all the Roses in a cluster are seldom at their best at the same time. We have, therefore, to resort to other means to obtain the result desired. This is the process of "clearing up." I have here two vases of the Rose Tausendschon, and I am going to ask Mrs. Darlington, while I am speaking, to prepare one of them by the removal of all the flowers that are past their best. The other vase we will keep for comparison. You will notice now how much brighter and fresher are the flowers that are left, and how much better the foliage looks after the bunches have been reduced in size. The question of foliage is sometimes a difficulty. I have never felt quite sure whether the rule disqualifying an exhibit for added foliage is intended to apply to decorative exhibits, but there is nothing in the wording of the rule to prevent its application, and I believe many get over the difficulty by adding sprays of foliage and a certain number of buds. In the matter of foliage, how-

open as possible, then cutting off all the open flowers, and plunging the sprays up to their heads in water. If the buds were in the right stage, they will open indoors during the night, and be beautifully fresh and clean for the show next day.

Perhaps I should say a word about the points to which the attention of judges of decorative Roses is now to be directed. The National Rose Society has recently issued a new code of instructions to judges of these classes; they have not yet stood the test of trial, and are, perhaps, open to some criticism. It is not unlikely that it will be difficult to apply them to some classes, and they are rather complicated to carry in one's head. However, their introduction is a move in the right direction. [The speaker then read and commented on the new regulations.] You will notice that here "brightness," which I take to be the same quality I have called freshness, is put first, and receives the highest number of points. If difficulty arises, goodwill, I trust, will get over it, and simplicity may be reached in time.

FLORISTS' FLOWERS.

DWARF CHRYSANTHEMUMS.

DWARF Chrysanthemums are useful for many purposes. They may be raised at the end of May and during June from the tops of plants grown in the ordinary way. The shoots root readily if they are made about 3 inches long and inserted four around the sides of a small 60-sized pot in good, sandy soil. Plant firmly, and then well water the cuttings by means of a rose-can. Place the pots in a deep box in a shady place out-doors and cover the box with a sheet of glass. The shoots will form roots in about a month, and the plants should then be gradually exposed to air and sun-light. When the cutting pots are filled with roots, shift the plants, without dividing them, into 5-inch pots. Employ good, loamy soil, and ram it firmly. Practically all the single and decorative varieties of Chrysanthemums are suitable for growing in this manner. J. R., Enfield.

SWEET PEAS OF RECENT INTRODUCTION.

It is my privilege to have at present some of the latest and finest varieties in bloom. The plants are more than 4 feet high, having been grown for me during the last six months by Mr. Findlay, head gardener at Logan House, in a cool conservatory, and transplanted to the open ground in my garden at the end of April. I have never had Sweet Peas in flower so early before, for in former years it was usually in July that they came into bloom. I have given them for the most part very picturesque situations, in soil enriched with an application of leaf-mould and bone-ash, and they are growing with great strength and marvellous rapidity. Some of them are making their way up venerable Apple trees, where, ere long, they will create, amongst the congenial shade and coolness of the branches, highly artistic effects. One of them, namely, the beautiful Mrs. Hugh Dickson, of pale salmon-pink colour and tender cream, is already adorning with its large and refined blossoms, my only Walnut tree, which will probably wear an aspect of greater beauty this season than it has ever worn before. This Sweet Pea, which is especially distinguished by refinement, is unquestionably one of Messrs. Dobbie's finest introductions. Among varieties of its own colour it shines supreme. The other varieties that at present make my garden fascinating are Sun-proof Crimson, surely a great advance on King Edward Spencer, especially in the direction of colour-preservation, seeing that in the strongest sunlight, its peculiar brightness and purity are unstained; Edrom Beauty, which has expressively been characterised as a "glorified Helen Lewis"; Arthur Green, with maroon standard and violet wings "like a rich jewel in an Æthiop's ear"—as Shakespeare sings; the ex-

FIG. 2.—HEDGE OF NERIUM ODORUM (OLEANDER) WITH SANCHEZIAS AND GALPHIMIAS IN THE FOREGROUND.

(See p. 11 and Supplementary Illustration.)

against the practice, but, in the case of some of these Roses on long stalks, which will hang their heads, it can hardly be avoided, and, for Roses of this description, wiring seems necessary in order to keep the flowers upright and fresh during the show. All I can say is, use wires as seldom and let them be as inconspicuous as possible. In order to get these long-stalked Roses, a certain amount of disbudding will be necessary, but it need not be so severe as in the case of exhibition Roses, and I have not found that any removal of shoots is required. I am not, of course, referring to spring pruning, which should be rather severe, so as to get good growth.

(2) Next, as to the Roses for bunches. I believe that the art of showing Roses is to get them at the show as fresh and as brilliant as possible. Freshness is the first requisite for all Roses that are to win prizes. It attracts the eye of the judge more surely than any

ever, be careful not to put in too much, or your bunch will appear heavy; and remove all injured leaves as carefully as you would injured flowers. The arrangement of the bunch should be such that it is light and tasteful, and yet not straggling or untidy. When the bunches are arranged, their position in the stand will require consideration, so that the display may produce a good effect when viewed as a whole, and that the colours of the different varieties may not clash.

(3) Single Roses and Briars. These are, I believe, in some respects, the most difficult to show really well. The chief point still to remember is freshness; but this must extend not only to the petals of the Roses, but to the stamens, which must be a bright and clear yellow in the centre of the flower. It is often difficult, and, in bad weather, sometimes impossible to get this result in flowers which have opened out-of-doors, and the best plan, as a rule, is to pick the flowers early the day before the show, getting as many sprays with buds just about to

* An address delivered by Mr. H. R. Darlington at the annual meeting of the Potters Bar and District Amateur Rose Society.

quisite, ivory-coloured Isobel Malcolm and Masterpiece. Masterpiece is a grand flower; its most formidable rivals being Florence Nightingale and Asta Ohn. I am looking forward to the period when my Eckfordian namesake, recently crossed with the Countess Spencer by Mr. Henry Ohn in California, will reappear in this country with considerably longer stems and larger flowers of Parma Violet hue. When this is achieved, it will be an important floral acquisition.

Other Sweet Peas which I have in my garden sown in the open ground in March, are the Californian Ethel Roosevelt (raised by C. C. Morse & Co.), a soft primrose suffused with faintest carmine-rose; Florence Nightingale, a highly-endowed native of Newtownards; Mrs. Routzahn; Mrs. C. W. Breadmore; several beautiful representatives of the "Paradise" hybrids, raised by Miss Hemus; and Marie Corelli. David R. Williamson. June 14.

THE ALPINE GARDEN.

THREE GOOD PLANTS FOR THE MORAINE.

DRABA DEDEANA (syn. *D. aizoides* var. *Dedeana*), see fig. 3, from the European Alps is a close-tufted little plant of cushion habit, with dark-green, hairy leaves, the whole somewhat resembling *Saxifraga Elizabethæ*.

The flowers are white, and numerous produced. The plant delights in the gritty soil of the moraine and full exposure to sunshine, with an abundance of water whilst growing.

Draba pyrenaica (syn. *Petrocallis pyrenaica*), illustrated in fig. 4, is a charming miniature species growing only 2 inches high and forming a rather less cushion-like growth than *D. Dedeana*. The leaves are rather lighter in colour than the latter, very small, and fringed with hairs.

The flowers appear (as in the case of *D. Dedeana*) early in April, being a most delicate

about among the stone chips without any assistance, and spreads quite rapidly.

Many alpine plants are difficult to cultivate in the ordinary rock garden, dying in the centre of the clumps, whilst remaining fairly healthy at the edges. So far as my experience goes, this is not the case when they are planted in the

FIG. 4.—*DRABA PYRENAICA* FLOWERING IN A MORAINE GARDEN.

moraine, the centres, as well as the edges of the patch, remaining healthy and vigorous.

The other plant, *Eritrichium nanum* (see fig. 5) is the gem of the higher Alps, and I fear in many cases the despair of the Alpine gardener.

It, too, possesses the hairy foliage which is present in so many plants that are difficult to cultivate, the leaves being somewhat strap-shaped and pointed.

The blue colour and general delicate charm of the flowers of *Eritrichium nanum* are appreciated by all. The season of flowering is short, but brilliant, since in its native habitat all the uncertain early portion of the year is gone by the time the thick blanket of snow, which covers it during the winter, is melted. The plants come forth immediately into the height of summer, while in the autumn they are put to rest by the falling temperature, and protected effectually all the winter by a deep covering of dry, powdery snow.

These conditions are impossible in gardens, but we can imitate them in certain respects. The grit of the moraine permits the winter rains to pass rapidly through it, and not lie about the plant. Some growers advocate planting *Eritrichium* under an overhanging stone to keep off wet. This does not seem to me to be the most advantageous way of securing that desirable end, since the stone provides a certain amount of shade from the sun's rays.

The plan I find best is to plant it in the most exposed part of the moraine, and when November approaches to place a sheet of glass, considerably larger than the plant, some 3 inches or 4 inches above it, supported on three or four bent wires. If this is given a slight fall to one side the rain does not find its way in.

If, in addition, dry silver sand is sprinkled in between the growths at the same time (early in November) so as to almost entirely bury the green points, it will prevent the cold winds from shrivelling up the minute growths. Reginald A. Malby.

LILIES.*

IN no branch of open-air gardening have failures been so numerous, and successes so few, as in Lily culture. The caprice of this most delectable clan has brought countless amateurs to despair, deepened by the reflection what British gardens might be if Lilies would but behave as reasonably as Roses. Yet it is not all caprice, as Mr. A. Grove explains in his volume upon *Lilies* in the Present-Day Gardening series, and he, if anyone, ought to know, seeing the manner in which he has overcome difficulties which most men would have shirked as insuperable, in cultivating some of the most refractory species on the chalk hills of Berkshire. "What do you mix your paint with?" was the lady's inquiry of Sir Joshua Reynolds. "With brains, ma'am," was the artist's reply, and here is Mr. Grove to convince us that the cunningest concoctions of loam, peat, grit, sand and what-not are vain without that same ingredient. Yet how few amateurs—how comparatively few professional gardeners—could declare at short notice whether any particular Lily was stem-rooting or base-rooting? Of the lavish expenditure upon Lily bulbs each autumn what a small proportion is invested with any consideration for the special requirements of each species in regard to soil, aspect and depth of planting. Henceforward there will not be a shadow of excuse left for blunders by anybody who can spend eighteenpence on Mr. Grove's pretty manual. If this author does not write with the picturesque exuberance displayed by some authors, if he only allows his latent enthusiasm to peep out here and there among the practical paragraphs, the very quietness of his tone inspires confidence in his precepts. Admitting, as he does, that there are Lilies which have hitherto baffled every device of the cultivator, he assures us from experience that there is no reason why nine-tenths of the known species

FIG. 5.—*ERITRICHIMUM NANUM* FLOWERING IN A MORAINE GARDEN.

(about 70 all told, with twice as many varieties) should not be brought to perfection in British open-air gardens.

"There are many kinds that present no more difficulty to the intelligent grower than do Daffodils and Tulips; all it is necessary to do is to procure sound bulbs and plant them under suitable conditions. But no one should attempt the cultivation of the more troublesome sorts without a stout heart, a strong stock of patience, and a determination to get to the bottom of the difficulties with which he will be faced from time to time, and which, while sometimes seeming almost invincible, may one by one be overcome, leaving behind them ample reward in the delight

* *Lilies*, by A. Grove, F.L.S., with preface by H. J. Elwes, F.R.S., and eight coloured plates. (Present-Day Gardening Series; edited by R. Hooper Pearson.) (London: T. C. and E. C. Jack.) Price 1s. 6d.

FIG. 3.—*DRABA DEDEANA* FLOWERING IN A MORAINE GARDEN.

shade of lilac. The appearance of the plant in bloom from a little distance resembles a lilac flush on the moraine.

I believe the plant requires almost yearly splitting up, and replanting when grown in the ordinary rock garden, but it seems to scramble

with which the patient grower will watch the unfolding of such exquisite blooms of *L. Leichtlinii*, *L. Kelloggii*, *L. rubescens*, or *L. japonicum*."

Unfortunately, to procure sound bulbs is not so easy as in the case of Daffodils and Tulips. To buy Lily bulbs imported from America or Asia "is gambling pure and simple," so ruthless is the handling they receive in being torn from their native woods and hillsides or in being harvested from Japanese farms, not to mention the vicissitudes of travel and storage. To overcome the results of these serious drawbacks, Mr. Grove prescribes two alternative plans, one being to raise the more difficult species from seed, which postpones fruition for any time from three to seven years; the other, to grow imported bulbs for the first season in pots, picking off the flower-buds to encourage the formation of roots, which alone can impart the vigour necessary to throw off the fungous disease and root mites so constantly present in bulbs imported from Japan. All this is intolerable to persons impatient for immediate effect, but for those who can possess their souls in patience the reward is sure.

Alas! we search Mr. Grove's pages in vain for a specific against *Botrytis cinerea*, that fatal fungus which has put an end to thousands of the peerless Madonna Lily in gardens where once it thrived as vigorously as any herb of the field. The inexplicable feature in the case is that in some gardens (the present writer's, for instance) certain clumps grow and flower as strongly as ever, while but a few yards distant, in similar soil and aspect, the stems arise only to wither untimely away.

We cannot too warmly commend Mr. Grove's treatise to the attention of gardeners and amateurs; every paragraph is written with a profound and practical knowledge of the subject. A word of praise is alike due to editor, publisher and printer. The eight coloured plates are admirably executed, rendering the volume one of the most attractive in a series as remarkable for cheapness as for a high standard of excellence. Critics, being animals of prey, cannot be satisfied without drawing blood. In this instance the only complaint that can be made is that there is no full index. *Herbert Maxwell.*

SCOTLAND.

THE DROUGHT OF 1911.

Now that the memorable drought has passed away (June 17), it may be interesting to note some of its effects upon garden plants. The soil here is a light loam, overlying rock and boulder clay, and craves a shower once a week. It received scarcely a drop for five weeks of flaming sunshine. Notable among Asiatic Primroses is the behaviour of *P. Bulleyana*. While *P. japonica*, *P. pulverulenta*, *P. Poissoni*, &c., flagged hopelessly in the borders, *P. Bulleyana* never turned a hair, but held aloft its fine whorls of deep-yellow flowers crowned with orange-tinted buds. *P. japonica*, naturalised in the woods, suffered not at all, and that is the place to grow it, for rabbits touch it not. In such a situation it carries its whorls 2 feet high. Roses have suffered from caterpillars, but, strange to say, there has been very little green fly. Lilies never were finer. *L. giganteum* may come a foot or two short of its full stature, though some stems are already over 7 feet high; but *L. Humboldtii magnificum* has risen to 6 feet, and is still rising, and *L. pomponium* is well up to 4 feet. Mulleins are having the time of their lives; the growth of *Verbascum leianthum* and *V. olympicum* is remarkable.

Among the finer *Meconopsis*, there has been some distress, as was to be expected. *M. Wallichii* and *M. paniculata*, planted out in 1910, are quite as fine as usual. The former species is not yet in flower, but the latter is expanding its purple blossoms at a height of 5 feet. *M. aculeata*, with its petals of an inde-

scribable pale azure, has fared irregularly, some plants throwing up fine spikes, others poor ones, whilst a few have not passed safely through the winter. *M. sinuata* v. *latifolia*, closely resembling the colour of *M. aculeata*, has done well, but was not planted out till April. *M. integrifolia* began to flower in the last week of April, and early plants rose to their usual height; but those flowering or to flower now have been sadly stunted by the drought. Among the seedlings of *M. integrifolia*, one produces pure white blossoms.

On the wall garden we have to lament some losses, despite pretty sedulous watering; but the Alpine species of *Dianthus* have never been better than they are at present. *D. calligonus* is the prince of this group, whether for delicate colouring or profusion of bloom. *Lithospermum prostratum* resents parching,

[Photograph by John Gregory.]

FIG. 6.—*PHILADELPHUS HYBRIDUS LEMOINEI* VIRGINAL: FLOWERS WHITE.

Awarded R.H.S. First-class Certificate on June 20.
(See p. 430.)

but *L. graminifolium*, *L. rosmarinifolium*, and *L. petraeum* delight in it. *Spiraea decumbens* differs from most of the genus in that it thrives on a nearly vertical retaining wall, its charming foliage covering fully a square yard, at present gay with innumerable white rosettes. Campanulas seem to like the heat and drought, the earliest of all being *C. Allionii*, which commenced to flower on May 10.

One other plant deserves special commendation for its behaviour during a trying period, namely, Messrs. Robert Veitch & Son's hybrid *Calceolaria* "Golden Glow," which not only came through the winter without the slightest protection, but has been a mass of flowers since the beginning of May. *Herbert Maxwell, Monreith.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

RAINFALL AT WALTHAM HALL GARDENS, LINCOLNSHIRE.—Heavy rains fell in this district on June 23, 24 and 25. From Friday 8 a.m. until 8 a.m. Saturday we registered 2.02 inches of rain. This chiefly fell between 3.35 p.m. and 8 a.m. Saturday's rainfall amounted to 1.08 inches. Friday's rainfall must have done a considerable amount of damage in the local low lands. *Chas. Frankish.*

MARECHAL NIEL ROSE.—Mr. Hudson in his weekly calendar for June 24 advocates Continental methods of treating this splendid variety of Rose, but a more rigorous use of the knife or saw is even better. I have in my mind's eye a span-roofed glasshouse about 20 feet by 9 feet, with a centre path and a 3 feet border on each side, planted with five plants of Marechal Niel Rose and one of Reve d'Or. At Easter this house presented a spectacle never to be forgotten. The plants were cut down to within 3 feet of the ground every year after flowering, and they seemed to break stronger each succeeding year, the new growths completely covering the roof. I now treat my plants of Niphetos in the same manner, and I am getting twice the number of flowers obtained when less pruning was practised. *A. J. Elgar, Killarney House Gardens, Co. Kerry.*

TROPEOLUM SPECIOSUM (see pp. 394 and 418).—Quite recently I happened to visit Nuneham Park, Oxford, the residence of the Rt. Hon. L. V. Harcourt, M.P., and I saw this brilliant climbing plant in the most excellent condition. I was informed that it was planted some three years ago, the rhizomes being placed horizontally, 9 inches deep in the soil, and made firm after planting. The plant is growing in a well-sheltered Rose garden, and it covers a considerable space on the front of Box (Buxus) bushes about 12 feet in height to which the shoots cling with apparent delight, and nearly reach the top. The aspect is a northern one. Mr. Munday, the gardener, is deserving of congratulations for his management of this difficult plant and the many other interesting and beautiful objects to be seen at Nuneham. *W. Fyfe.*

—Mr. Greening's note on this plant gives rather a wrong impression of the climate of the western counties of England. As a Devonian born and bred, and having lived for more than a decade in Cornwall, I should hesitate to describe the climate of those counties as being hot in the general acceptance of the term. During my time in Cornwall I only experienced three short spells of really hot weather. When the temperature rises above the normal there is nearly always an excess of atmospheric moisture, and this makes the air close and muggy rather than hot. Such an atmosphere naturally induces luxuriant vegetation and is suitable to the needs of soft, fleshy-foliaged plants, and this is largely the reason why *Tropæolum speciosum* often thrives so well in the western counties. This being the case, one rightly expects to find the plant under notice luxuriates wherever there is a fair amount of atmospheric moisture, combined with a moderate temperature, and, as Mr. Greening remarks, pure air. In such places as the western districts of Scotland, Ireland, and England these conditions prevail, and the *Tropæolum* does well even when exposed to the noon-day sun, but elsewhere it becomes necessary to afford the plant a northerly aspect. *A. C. Bartlett.*

—It is difficult to account for the failure experienced in many places to grow and flower *Tropæolum speciosum*, for the plant does well in places widely apart under different conditions as regards soil, situation and climate. Many years ago I saw a plant in fine flower growing against a wall having a north aspect in the gardens at Davenham Bank, Great Malvern, Worcestershire, then in charge of Mr. Jacques. The soil in which the plant was growing was, I think, a light and fairly rich loam. I also remember seeing the plant in fine flower at Ivy Cottage, Tynningham, Prestonkirk, in East Lothian; the trailing shoots completely covering a rustic arch, and extending over an

adjoining fence. It was growing in ordinary garden soil, within a mile of the German Ocean, while at East Linton, three miles distant, most of the window-boxes were filled with plants of this *Nasturtium*, producing a very graceful effect. At Poltallock, in Argyllshire, the plant, I understand, succeeds like a wildling, in any position and in any kind of soil. Mr. D. Melville kindly sent me a few roots from Poltallock, many years ago, which I tried to grow in two or three different situations at Longford Castle, but with indifferent success. I am under the impression that the plant would succeed here on the east coast. *H. W. Ward, Rayleigh.*

ROSA HEMISPHERICA (p. 418).—Mr. Divers thinks that the statement on p. 394 about this Rose requiring dry weather is somewhat misleading. I think not. I know the Rose well, and the year before last one of my trees produced over 400 blooms, but one day's rain spoilt all but the unopened buds. It is a true species, not a variety. *H. N. Ellacombe, Bitton Vicarage, Bristol, June 21.*

PICTURES OF EGYPTIAN RICE FIELDS AND ENGLISH MEADOWS AND GARDENS.—Three exhibitions of water-colour pictures are on view at the Modern Gallery (61, New Bond Street, W.), and each appeals to the lover of Nature in a different way. The most unusual and interesting—in that the drawings are seemingly truthful renderings of Cleopatra's country under a more infinite variety of Nature's moods and effects than we are accustomed to see served up to us by the painters of Egypt—are Mr. F. F. Ogilvie's studies and sketches of Egyptian canals and Rice-fields in flood and harvest. His groups of Date Palms—as they are, in close proximity in the foreground and in the distance—silhouetted in their delicate, feathery grey-green, against the peculiar pale-green sky effects prevalent above the Nile waters and reflected in its depths, are instructive to the botanist and the student of trees, and delightful to the amateur, in the true sense, as a lover of the beautiful. Mr. Ogilvie not only paints with an eye to the appearance of his subject-matter, but with an understanding mind as to its object and significance in the scheme of things. He knows, for instance, that the solitary Palm in a wide stretch of desert means more than a mere handful of Dates—though it sprang from a single Date stone cast away. It means water at the roots, however dry and arid the surroundings, or it would not have germinated there. He has also a tale to tell of the insidious, crimson Bougainvillea, of which a specimen is portrayed in his white-walled "Cairo Garden." Only a short time since introduced from South America to these coasts—this gorgeous creeper, in all its pomp of purple-reds—finding a soil so fertile, climatic surroundings so sympathetic, has now spread itself along the shores of North Africa and up the Mediterranean, and taken possession even of the Canary Islands. The Temple of Philæ is the subject of many of Mr. Ogilvie's sketches. "The Hall of the Columns" should be specially noticed for its essentially botanic bases of design. Each column is varied. One is built up on the idea of the Lotus, a sheaf of the long, slender tubes of the stems being, apparently, bound below the petals, which turn over to form the capital. Another has the Papyrus for its basic idea; another the Date Palm—all plants indigenous to the great Nile valley; but that pert upstart, the modern creeper, that crimson Bougainvillea is absent from this Temple of Isis. Of the two other exhibitions, first should be seen the work of Mr. Joseph Powell (in the central hall), who shows a fine drawing, full of atmosphere and charm, entitled "Blackdown from Hambleton Common." Here, under a fine sky, we see the Heather at its best, softened down by autumn's touch to a restful colour, not so blatantly crimson and crude as it so often appears in the height of summer. This artist also has some excellent hayfields, the one entitled "Leatherhead" being particularly noteworthy and discriminating; and the word is used advisedly, for had the third exhibitor, Mrs. Caldwell Crofton (Helen Milman), exercised this quality, her "Heather Pictures and Gardens" would have gained in artistic excellence. Many of her drawings are good in design and well placed on the paper. They are, however, capable

of being carried further, and, with a modicum of the grace and sentiment she has expended on their titles transferred to the little pictures themselves, would be infinitely more pleasing. "The Pergola, Norman's Wood," exemplifies this criticism. The design is good, and the massing of white flowers—tall Lilies down below and white Clematis high on the arch against the sky—are a credit to both the gardener of Norman's Wood and the artist. "Lilac Arch," Boughton Park, is good; also quaint Hayes Barton, the birthplace of Sir Walter Raleigh—as far as it goes. There is an unstudied sketch of wild Hyacinths on a bank which is described as "Bluebells," and has merit, though a little harsh in colour. *Mary L. Breakell, June 25.*

PROF. MARSHALL WARD.—In connection with the note on the late Professor Marshall Ward (see p. 411), it may interest some of your readers to know that his son, Mr. Frank Kingdom Ward, is at present plant-collecting for us on the Salween-Mekong Divide in Western China. This is the range along which Mr. George Forrest, unaided and bare-footed, made his marvellous escape from the pursuing Lamas (see *Gard. Chron.*, May 21, 1910, p. 326). The range is a perfect garden of Alpine plants, and, as the district is now quiet, Mr. Ward has ventured to it, hoping to secure, amongst other choice subjects, the much-desired *Meconopsis speciosa* and the "black" *Rhododendron* of Tsekon. *Bees Ltd., Ness, Cheshire.*

HIPPEASTRUM BULBS DESTROYED BY GRUBS.—Last winter four or five bulbs of *Hippeastrum* in my greenhouse were found to be infested with stout grubs, and I at once suspected them to be the larvæ of the "Narcissus fly" (*Merodon equestris*), which is generally common in gardens. To make sure, however, the larvæ were placed in a breeding cage, with the result that more than one dozen of the flies hatched in May and June. Fortunately, in this case the bulbs were not costly ones, but it shows how serious the loss might be if a few flies, or even one female fly, gained access to a choice collection of these plants. *Fredk. C. Adams, Fern Cottage, Lyndhurst.*

RED SPIDER ATTACKING VINES.—I agree with Mr. Cox (see p. 394) that too much heat is often used during the flowering period of the Vines, and also that most vineries are kept far too dry. Another cause for red spider appearing is the border being dry. During the stress of work in the spring the vine border is often overlooked just at the time when, owing to the vines being in active growth, it requires more attention than ever. It is a good plan to examine the border before the vines flower, and, if needed, it should be given a good soaking of clear water. This will carry them over the flowering period, and they may be watered again after the bunches are thinned. I am sure, given fairly good weather, that the most obstinate setting varieties will have a good supply of berries if a normal heat is maintained in the pipes, and a little fresh air admitted through both the bottom and top ventilators. The rods should be tapped quite sharply about mid-day to distribute the pollen. With regard to the question of red spider, the position and construction of the vinery have much to do with it, but on the whole close attention to cultural details is the best way to combat the pest. With proper damping down and watering, and careful attention to opening and closing the vinery, red spider need not be feared. The sulphuring of the pipes should, in my opinion, rather be taken as a cure than as a preventive. As soon as red spider is noticed, close the house and push the fire to make the pipes very hot, then paint them with milk and sulphur. As soon as the fumes of sulphur can be seen, stop the fire, and allow the house to remain closed for about one hour, then open the top ventilator just a little, and allow it to remain open all night, increasing the amount of ventilation next morning. I have practised this method in the case of both Vines and Peaches with excellent results, and without the least harm resulting to the foliage. There is great danger from scorching next day if the house is not opened the evening the sulphur is applied, and also the next day. It is often possible to stop red spider from

spreading by spraying the affected leaves, but this must be practised early to be effectual. I do not agree with the recommendation that the pipes should be always kept painted or dusted with sulphur as a preventive measure, as, in hot, dry weather, the remedy would prove more injurious than the spider. The old maxim, "A stitch in time saves nine," applies well to red spider attacking Vines. I am not sure that sulphuring would be effectual were the house allowed to get very badly infested with the pest. *R. W. Thatcher, Wistow Hall Gardens, Leicester.*

NODULES ON NON-LEGUMINOUS PLANTS.—Mr. Harold Evans, on p. 360, draws attention to the presence of nodules on the roots of *Clematis integrifolia* growing on land previously cropped with Lupins. Prof. Cavers, who had examined them, believed them to be due to nodule bacteria. At my request Mr. Evans kindly sent me some roots of the *Clematis* bearing what he believed to be similar nodules. The swellings on the roots were superficially somewhat similar to those seen on some of the Leguminosæ, though less irregular in form than those which leguminous plants often bear. The largest were about $\frac{1}{2}$ inch in length and $\frac{1}{4}$ inch in diameter, and smooth externally. Some of the roots bore several such swellings. They reminded me greatly of swellings seen on roots of *Clematis vitalba* sent to Wisley Laboratory last year from an entirely different source, which were produced by the attack of the root eelworm, though they were somewhat larger. A section across a swelling showed one or two small brown areas due to the presence of dead tissue, and from these could be picked out with a knife point tiny, colourless, globular bodies difficult to discern in the tissues, but easy to see with the naked eye when removed. These proved to be the egg-filled bodies of the "root-knot" eelworm *Heterodera radicola*. There were no traces of nodule-producing bacteria in the tissues. The nodules had undoubtedly been formed through the attack of the eelworm, which affects the roots of Cucumbers, Melons, and Tomatos, forming the worst pest which the market gardener under glass has to contend with. Some 60 different species of plants are known to be subject to the attack of this parasite, to which Berkeley first drew attention in the *Gardeners' Chronicle* in 1855 (p. 220). Being desirous of obtaining the nodule-forming bacteria from *Clematis*, I communicated with Prof. Cavers in the hope that he would be able to send me some of the nodules originally sent to him, but he permits me to say that, on re-examination of those nodules, he feels convinced that they, too, were produced by the attack of eelworms, and had no connection with the nodule bacteria of the Leguminosæ. To induce bacteria to take up their abode in the roots of non-leguminous plants, and so to confer upon them the same benefits that leguminous plants derive from their presence, is a fascinating dream which may not be beyond man's power to materialise in the future, but so far it appears to have eluded his efforts. I have been unable to verify the quotation made from Percival's *Agricultural Botany* by Mr. J. Smith. *Fred. J. Chittenden, Wisley Gardens.*

EXTERMINATION OF EELWORMS.—In the *Gardeners' Chronicle* of June 3 last (p. 351) mention was made of experiments to exterminate eelworms by means of carbon bisulphide from pot plants of Begonias. I have been asked many times by gardeners and others attending my lectures if I knew of or could suggest a remedy. I have tried various agencies with varying results. As there are doubtless many gardeners who get a batch of Begonia Gloire de Lorraine infested with the pest, probably just when the plants are becoming useful, and when they can ill afford to destroy them, I would recommend them to top-dress the pots with Rape dust (Rape meal), which acts as an exterminator of eelworms and a fertiliser of the soil at the same time. Among the numerous head gardeners to whom I have given this information is the gardener to the Rt. Hon. Lord Henniker, Thornham Hall, near Eye, Suffolk, who had a very large batch infested. I sent him a parcel of Rape meal, which cleansed the soil in which his plants were growing, and also improved the quality of the plants. *John Smith, County Council Lecturer and Instructor in Horticulture, Durham.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

ODONTOGLOSSUMS.—The late summer and autumn-flowering members of this genus, including *O. grande*, *O. Insleayi*, and *O. Schlieperianum*, are showy and useful Orchids, possessing the additional merit of being easily cultivated. The plants are not so fastidious in their atmospheric requirements as are *O. crispum* and similar species, therefore amateurs and others not possessing an Orchid house may grow Odontoglossums in company with ordinary greenhouse plants requiring a fairly humid atmosphere. In the Orchid house proper, the plants may be grown in the cool, intermediate house. Regarding their blooming season, they are rather erratic, especially *O. Insleayi* and *O. Schlieperianum*, but from now onwards they are usually at their best condition of flowering. The blossoms, if kept dry, remain in perfection for a period of three or four weeks, and if the plants are healthy, no harm is done by allowing the flowers to remain. The young growths are produced early in summer, the date varying a little in the different species, but roots are not produced from these young growths until they have attained to a considerable size and have formed pseudo-bulbs. However, the older roots will be very active, and therefore the plants should, if necessary, be repotted while the young shoots are only a few inches high. Frequent disturbance at the roots is harmful, but the plants should not be allowed to remain in a sour compost. When repotting is necessary it should be done thoroughly, first removing all old and sour materials from about the roots, replanting in a compost consisting of equal parts, *Osmunda* fibre, Oak leaves, and *Sphagnum*-moss, used in as rough a condition as possible and mixed with plenty of coarse silver sand. The roots, being larger than those of most Odontoglossums, grow best in a rough medium. The plants should be grown in pots or pans supplied with ample drainage. Pot moderately firmly, and surface the pot with clean *Sphagnum*-moss. Water must be supplied carefully for some time afterwards, and care must be taken in its application not to let any lodge in the young growths, or the latter may damp off. When established and growing freely, the plants enjoy a liberal treatment, and this should be afforded during the flowering period and afterwards, until the pseudo-bulbs have fully matured. During the resting season not much moisture at the roots is required, but the plants should not be kept thoroughly dry or they will show the effects by shrivelling, by forming weak growths the following season. These Odontoglossums should be afforded a light position with a free circulation of air at all times, and should be shaded moderately from bright sunshine during the summer. Insect pests are very troublesome to all the plants of this section, wood-lice and small snails being very fond of the succulent leaves on the young shoots; the cultivator must therefore be on the watch for them, and adopt preventive measures.

O. CITROSUM.—This beautiful Orchid is not at all difficult to cultivate. Any light house wherein plenty of fresh air is assured and where a cool, intermediate temperature is maintained will suit the plants. *O. citrosum* succeeds best when grown in pans or baskets close up to the roof glass, under a moderate shade. It requires plenty of moisture when growing freely, and especially in the autumn when the pseudo-bulbs are thickening. This Orchid resents root disturbance, but when new rooting material is necessary, it should be afforded directly the plants have passed out of flower. The compost should be rough and open in texture, and consist of *Osmunda* fibre mixed with a little fresh *Sphagnum*-moss; the drainage materials must be ample and they should be arranged with care. Avoid over-large receptacles, and, when repotting, make the materials firm about the roots. After root disturbance the plants sometimes shrivel badly, and care is required to induce the plants to re-establish themselves quickly.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

TURNIPS.—It is necessary to make another sowing of Turnips, selecting a somewhat shady position, as the roots soon become stringy and hard if exposed to strong sunshine. The Turnip requires a rich soil. In order to produce good-sized roots as quickly as possible, thin the plants to 9 inches apart as soon as they are large enough to handle. The Turnip is a moisture-loving plant, and if dry weather should set in a plentiful supply of water should be given to bring the crop to maturity without a check. Red Globe, Snowball, and Green Top Stone are reliable kinds for present sowing. A small sowing of the variety Early Milan made at the same time will furnish roots ready for use 10 days in advance of the others. Give frequent dustings of soot or wood-ashes in the early morning while the foliage is damp to keep the Turnip fly in check.

SPINACH.—Seeds of this vegetable may be sown broadcast on a north border or in empty pits where a plentiful supply of water can be given. At Frogmore the principal supply of Spinach for the next two months is grown in this way, until the pits are required for the protection of some other crop. If the seed is sown moderately thickly the Spinach may be cut close to the ground as soon as it is large enough; by this means a supply of young, tender leaves will be available without much trouble or expense.

PARSLEY.—Parsley may be sown now in some sheltered part of the garden for use through the winter and spring months. As soon as the plants are well above the ground they may be thinned to 4 inches apart, and the surplus seedlings may be planted in a cold pit for use when the weather is too rough to gather supplies from the open garden.

CUCUMBERS.—A sowing of Cucumber seed may be made now to produce plants for early winter supplies. These plants should be ready to put out by the second week in August. Sow the seeds singly in small pots and germinate them in a temperature of 70°. If the soil is moist at the time of sowing, no water will be necessary until the young plants appear through the surface, when a gentle watering may be given. Set the plants out, as soon as they are large enough, over a gentle hot-bed and as near to the roof-glass as possible. The soil employed at this season may consist of three parts turfy loam and one part decayed manure. Only a small quantity of soil should be placed on the bed at one time, but as soon as the roots appear through the surface of the mounds, light top-dressings of loam and horse-droppings should be given. A little soot dusted over the bed from time to time will give a deep colour to both fruit and foliage. Plants from which supplies are being gathered should be freely thinned and the roots top-dressed lightly with fine loam and artificial manure. Syringe the plants twice daily and close the house early in the afternoon, allowing the temperature to reach 90° with sun-heat.

TOMATOS.—Tomatos planted out-of-doors should be making a rapid progress in growth. The plants should be restricted to single stems: no side shoots should be allowed to remain after they are large enough to be pinched off with the finger and thumb. When a few trusses of flowers are set, the tops of the plants should be pinched out in order to hasten the development of the fruits.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

WALL TREES.—The watering and syringing of wall trees, except in the case of those on which the fruits are ripening, should be practised regularly. These operations are best performed during the afternoon or evening, as then the effects of the water last for a long time. Many neglect to water and syringe their wall trees in the mistaken belief that the trees receive sufficient moisture from rains and dews, forgetting that a tree planted against a wall, deprived by projecting copings of the natural dews and rains, and exposed fully to the rays of a midsummer sun, requires to be supplied with water, almost or quite as much as specimens that are grown under glass. In all probability the unhealthy

condition of the majority of wall trees is due to an insufficiency of water more than to any other cause. Where the trees have not yet been summer-pruned, the work should be commenced at once, otherwise the fruits upon such trees will not only be small and ill-grown, but they will be retarded in ripening and of inferior flavour. The neglect of summer pruning and timely regulation of the young shoots is especially detrimental in the case of Apricots, Peaches and Nectarines and other trees that produce their fruits principally upon one-year-old shoots. The pruning in winter requires a far greater amount of labour and patience when summer pruning is neglected; neither can it be executed with such accuracy. The stoning of Apricots, Plums, Peaches and Nectarines is now practically over, and the danger of the trees casting their fruits being past, the latter should be finally thinned, for, although sometimes a few drop off between the stages of stoning and first swelling, all thinning should now be completed. Nothing assists more in keeping fruit trees in a sound, healthy condition than regularity in their cropping, yet few growers thin their fruits sufficiently, the majority being ambitious of securing large crops. Morello Cherries or other berried fruits planted on north aspects, should, before the fruits commence to ripen their crops, be protected from birds by nets or tiffany. I do not advocate covering them with garden mats, as is sometimes done, unless it is desirable to preserve the fruits till a very late period.

STRAWBERRIES.—In many districts the layering of Strawberries will have been commenced; and in the more favoured localities many early runners are already well rooted in their layering pots. Where this work has not yet been commenced it should be put in hand forthwith, or the next season's crop of fruit will be a small one. The operation of layering the runners is so well understood that a repetition of the process is unnecessary. Keep the layers growing in a healthy condition whilst attached to the parent plant, and, when well rooted in the layering pots or turf, transfer them to their permanent quarters.

GRAFTED TREES.—Fruit trees that were grafted in the spring should be examined to see that the tying material is not cutting the stems; should this be the case, the bandage must be removed, and, if necessary, the graft should be secured by another piece of matting. All grafts that are making headway should be securely tied to a support to prevent damage by winds. One of the best methods of doing this is to attach a neat flower-stake to the stock, allowing it to extend beyond the young shoots. The growths may be secured to this from time to time as they grow.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PEACHES AND NECTARINES.—Where these fruit trees are planted in cases or houses in variety, a good succession of fruit may be expected. Unless the fruits are required as soon as possible, the general welfare of the trees will be served by allowing a free circulation of fresh air, especially on warm days, and maintaining a humid atmosphere by thoroughly damping the borders several times daily. Syringe the trees freely early in the morning and again in the afternoon, forcing the water well on the undersides of the leaves. This will do much towards keeping the growths in a healthy condition and will also keep down red spider. Thrips also must be kept in check, and unless the fruit is near to maturity, the house should be well fumigated in the evening. Continue to assist the trees by giving liquid manure, or a dressing of some quick-acting fertiliser, the latter to be washed into the soil by watering. On no account allow the borders to become excessively dry. Attend to the tying and regulating of the shoots before they come in contact with the glass of the roof. Elevate the fruits as advised in a previous Calendar, exposing them to the sun's rays as much as possible. As the fruits approach the ripening stage, the syringing of the trees must be discontinued. If it is required to keep back the fruits of a certain tree, it is an excellent plan to shade the roof over it with a mat during the hottest part of the day. The

fruits on late trees should be thinned to the requisite distance apart directly the stoning period is over. Allow the trees an abundance of air both day and night to retard the ripening of the fruits, and keep the surroundings thoroughly well damped.

CUCUMBERS.—Plants in pits, frames, and unheated houses will, at this season, augment the supplies of this crop. Admit fresh air with caution and keep the house, pit, or frame thoroughly well damped on hot days, and close the ventilators early in the afternoon to make the fullest use of the solar heat. Attend to the thinning-out of weak growths and the stopping of the remaining ones. Assist the plants with top-dressings of rich materials to encourage plenty of root action near the surface, also with applications of liquid manure, and an occasional watering, after the soil is sprinkled with some quick-acting, soluble manure. Cucumbers in houses that show signs of exhaustion should, at this season, be removed, the house washed, and a fresh batch of plants put out.

TOMATOS.—During this month it will be necessary to sow a further batch of some good reliable variety of Tomatos for fruiting during the winter months. Sow the seed thinly in pots or pans, and directly the seedlings appear place them as near to the roof-glass as possible. Shift the young plants into 3-inch pots, and should the growths be drawn, keep the roots low down in the pots. Grow the plants as sturdily as possible, affording cool conditions, and after they have recovered from the shift, remove them to a cold frame. Before the roots become pot-bound, afford a further shift into 6-inch pots, using a compost consisting principally of good turfy loam. Pot firmly, and water carefully for some time after potting. Place a small support to each plant at an early stage. Tomatos that were planted out earlier in the season in Peach-houses, &c., are now fruiting freely. Having an unrestricted root run, they should continue to produce plenty of fruits. Plants growing in 6-inch pots intended for autumn fruiting should be potted on into larger receptacles as soon as possible.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

THE MIXED FLOWER BORDER.—The plants introduced to fill the spaces which were occupied earlier in the year by flowering bulbs have now nearly or quite furnished the ground, and the borders as a whole are looking well. The necessary work on the flower border for some time to come will be largely of a routine nature, such as the removal of weeds that have escaped notice, the tying of such rapidly-extending plants as Hollyhocks and Gladiolus, and the removal of dead leaves, withered flowers, and any other material that causes untidiness. Any novelties that were planted for trial and that have failed to satisfy expectations should be removed and replaced by some proved subjects from the reserve garden, no matter how common they may be. Old plants are sometimes overlooked, whereas they may be associated with others that will act as a foil, with good results. Thus an old-established plant of *Nepeta Mussinii* in these gardens had some scarlet-flowered Sweet Williams arranged beside it last spring, with a mass of *Anthemis tinctoria* alongside, and the effect was charming. Next season the hitherto somewhat despised *Nepeta* will be more largely employed.

THE FLOWER-BEDS.—The plants in the flower-beds are fast filling their quarters, and a systematic inspection of them should be commenced. This should also be done in the case of carpet-bedding at intervals of a week, but, in the case of ordinary flowering plants, it may be done less frequently. All the same, it takes a shorter time and not so much labour to attend to the plants at frequent intervals than when they are permitted to grow for a long time unchecked. Moreover, the garden presents either a rough or palpably overtrimmed appearance if this latter system is adopted, whilst, by the other, it is maintained in a uniformly tidy condition, so that, to the uninitiated, it would appear as if no care were bestowed in its keeping. There has been much fatality among annual Asters in these gardens, chiefly of the variety

Ostrich Plume. After exhausting my reserve stock, I am falling back on singles of the same colour which were prepared to supplement the Ostrich Plume varieties later in the year should they have finished flowering before the end of the season. The plants in two beds of Emperor Larkspurs have also been badly affected with disease. The beds meanwhile have been replaced with *Ageratum* of the same colour as the Larkspurs, and later, probably, Asters will be added. Our Begonias were slightly damaged by frost on the morning of June 15, but the plants are now growing out of the bad effects, and beginning to flower. It should not be forgotten to remove the female flowers of these plants before seeds have formed. They are usually well known, being the two small blooms at either side of a central male flower.

CARNATIONS.—The earlier-flowering varieties of Carnations, such as *Lady Hermoine*, are now opening their blossoms, and, if not yet attended to, a few of the latter, where they are crowded, should be removed. For decorative purposes, however, it would be wrong to thin severely, as the lower buds produce flowers when the main blossoms are over. Vigorous plants develop, in addition to the central flower-spikes, side growths, and these should now be advanced sufficiently to require tying. Just now, if labour can be spared, the non-flowering shoots may be thinned to about 8 or 10 on each plant, as they do not require to be crowded for layering, which may be commenced where the "grass" is in a proper condition; but a week or 10 days hence is usually early enough, and in the south a much later date is preferable.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

SEEDS FOR PRESENT SOWING.—*Calceolarias* of the herbaceous section should be sown as soon as possible. My plan is to sow in shallow pans and place these under handlights at the foot of a north wall. The soil should be fine and light, yet made firm, and thoroughly wetted previous to sowing. Stand the seed-pans over a pan of water as a safeguard against slugs and other insect pests. *Calceolaria "Golden Glory"* also may be raised in this manner, which is a more satisfactory method than sowing the seeds earlier in the year and germinating them in a slight heat.

PRIMULA SINENSIS.—This *Primula* may be raised during July better than earlier in the season. Early plants, it is true, are essential for late-autumn flowering, but those raised now, if grown without a check up to their flowering period, frequently make the best plants, as the early plants sometimes get somewhat hardened in growth, and do not continue to grow freely. The pans for sowing the seed should be prepared as for *Calceolarias*. After the seeds are sown, a piece of brown paper tied over the pan will keep the soil moist, and save watering the soil to such an extent as is necessary when the paper is not used. The pans may be stood in a favourable corner in the greenhouse or a close frame. Here, again, I advise the use of a hand-light as a means to the end, and a good layer of finely sifted ashes under the pans to produce an equable and moist temperature.

HUMEA ELEGANS.—The present is a suitable time for sowing seeds of this useful plant. Treat them as advised in the case of the *Primulas*. Do not aim at obtaining excessively large plants this coming autumn, but rather try to secure sturdy, if small, plants, and then grow them on freely next spring. A sappy growth is undesirable, as plants of this nature cannot withstand the winter.

CINERARIA SEED of both the florist's and the stellata or Star *Cinerarias* should be sown without delay. As in the case of *Primula sinensis*, the early sowings do not always furnish the best plants. Treat them as advised in the case of *Primulas*, but in this instance do not shade the seed pans so heavily. Harden off the seedlings by placing them in a cool frame as soon as they are ready to be pricked off. They need to be protected from brilliant sunshine; a frame with a north aspect is the best place in which to grow them.

GERBERA JAMESONII.—The seed pods will now be ripening, even on plants grown under a cool treatment, and the seeds should be sown as soon as harvested. By this means a batch of plants will be obtained which will flower freely next season. The seed can now be germinated easily in a cold frame. The new hybrids, known as Adnet's strain, afford flowers having a wide diversity in colours, and are well worthy of culture as pot plants. The full value of *Gerberas* as garden plants does not yet seem to be fully appreciated.

MIGNONETTE.—A sowing of the most-approved varieties for pot culture, if made now, will furnish useful plants for late autumn use. I advise that the seeds be sown in 6 inch pots at this season, afterwards thinning the seedlings to five or six plants in a pot. A cold frame is the best place for them. Other cultural particulars were given in a previous calendar. Plants that have been raised in smaller pots and are now growing freely may be potted into 6-inch pots that they may gain strength before the flowering trusses form. These will make fine plants for early autumn flowering.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

OLD MANURE BEDS.—We are preparing some of the old manure beds for planting Carrots as an autumn crop. The best variety for this purpose is "Bellot," but if pointed roots are required "La Chantenay" should be selected instead. The long-rooted varieties do not succeed so well as the stump rooted sorts, the leaves growing too luxuriantly and dropping readily during cold, damp weather in October. The seeds are sown broadcast, and covered with a good mulching of finely-broken manure. Light and frequent waterings are necessary to ensure a quick germination.

MELONS.—The last fortnight has not been favourable to this crop, and the maturing of the fruits has been retarded. The plants have withstood well the inclement change of weather as the shoots are strong and healthy. Watering has been withheld entirely, and ventilation given only moderately. It will be necessary to watch the crop very closely after the recent period of dull weather, as weak plants will be liable to wither with the return of bright sunshine, and this must be prevented by giving an abundance of fresh air and shading the glass carefully. The fruits will also ripen quickly and in quantity.

CAULIFLOWERS.—Cauliflowers are being planted four per light, in the Melon frames. They are only grown where there is a good local trade, as they hardly pay to send to market late in September. It is not advisable to plant Cauliflowers in Melon frames in gardens in the Midlands or the northern counties, as it is often necessary to replace the lights on the Melons in wet weather during August or September.

CUCUMBERS.—The plants growing in frames are now in bearing, and the fruits should be cut as often as possible. The glass can be shaded by spraying whitewash over the roof, but do not employ a brush as this would give too dense a shade.

TOMATOS.—Tomato plants have developed a considerable amount of wood during the past fortnight; the side shoots and the bottom leaves should be removed without delay. Now that the fruits are swelling the plants should be given a top dressing of nitrate of soda.

OPEN-AIR CROPS.—The Cauliflowers planted among the Lettuces in the early spring are now forming their inflorescences, and they will soon be ready for marketing. Where green Onions are in demand throughout the winter and spring months, a sowing should be made very thinly in a sheltered position. The seedlings are not pricked out, the roots being pulled as soon as they are ready, early in October. Instead of Onions, Chives may be sown. The variety "Early White" is the best for the purpose, though it loses its leaves in times of severe frost.

BEANS.—Kidney Beans should be sown in beds, each 4 feet 3 inches wide, three rows in a bed. This will allow frames and lights being placed over the plants late in September when the plants are in bloom. Canadian Wonder is the best all-round variety, but the variety Little Nigra is valuable for its compact habit of growth.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 8—Haverhill Sweet Pea and Rose Sh.

MONDAY, JULY 10—

United Hort. Benefit and Prov. Soc. Com. meet.

TUESDAY, JULY 11—

Nat. Sweet Pea Soc. Exh. in R.H.S. Hall, Westminster (2 days). Wolverhampton Floral Fête (3 days). Saltaire and Shipley Rose Sh. Brighton Fl. Sh. (2 days).

WEDNESDAY, JULY 12—

Bath Rose Sh. (2 days). Hereford and West of England Rose Sh. Elstree and Boreham Wood Hort. Soc. Sh. Croydon Fl. Sh. Woodbridge Fl. Sh. Guildford Fl. Sh. Hemel Hempstead Rose and Sweet Pea Sh.

A Collection of Established Orchids, also Imported Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Show at Olympia.

The summer show of the Royal Horticultural Society, an event which has been so happily connected with Holland Park, Kensington, has been held during the present week at Olympia. Our readers will remember with gratitude the extreme kindness of Mary Dowager Countess of Ilchester in placing her grounds on so many occasions at the disposal of the Society, and they will probably feel that the success of the Holland Park shows compelled the Council to continue the exhibitions, even though it was necessary to procure a fresh site.

By selecting Olympia, the Society has been able to hold its show almost next door to Holland Park, and this fact may have influenced the Council in the choice of building. It was not to be expected that any site at all comparable with Holland Park would be forthcoming, but it was felt that Olympia, although lacking the charms which characterise Lady Ilchester's historical and beautiful gardens,

nevertheless affords certain facilities for the holding of a flower show which cannot be obtained under canvas. Moreover, it was said that, whilst Olympia would be agreeable to visitors in the event of unfavourable weather prevailing during the exhibition, it would be possible, at the same time to illuminate the exhibition halls, and so to keep the show open until 10 o'clock in the evening.

It will be admitted that the task of arranging such a show was considerable. The immense area at the disposal of the Society, and the somewhat inappropriate character of the building for obtaining artistic effects were matters of great difficulty. In the main building, for instance, the staging erected covered an area of 33,000 square feet, besides 6,000 feet of staging in the galleries, and a large number of stands for the display of horticultural sundries. In addition, the annexe also provided an acre of ground available for exhibits. That the Society managed to get together an exhibition of such extent is a matter that should be remembered by those who may be disposed to criticise the details.

To attempt to compare the event with the Holland Park shows is scarcely a profitable task, the conditions being so unlike. Indeed, the Olympia show must be regarded as, in some degree, an experiment, and it will probably be felt that the experiment has not been altogether a favourable one. In the first place, whilst the buildings were especially suitable for a wet weather exhibition, the show was held under cloudless skies and a scorching sun that penetrated the building through the glass roof and heated the atmosphere to an extent that was as disagreeable to visitors as it was harmful to the plants and cut flowers. The Roses faded beyond recognition in a short space of time, and, although exhibitors did their best, by getting fresh flowers, to maintain a good display, the task was next to impossible. To a certain extent this state of things could have been prevented by shading the exhibits with a covering of art tinted muslin or tiffany, as is done in the case of most Continental shows, and the appearance of the building would likewise have been much improved. But even if this were done, it is thought by some exhibitors that the atmosphere would still be too dry for the welfare of the plants.

If such a show were repeated at Olympia, it might be possible to obtain better effects by still further raising the side stages and by providing tall Palms and plants of similar nature, to give a more furnished appearance to the somewhat unattractive interior. But we fear that the financial results of the show will not be favourable to a repetition of the experiment: this remains to be seen.

As is usual at the summer show, the Council entertained the Committees and judges at luncheon on the opening day when Sir Trevor Lawrence presided over a very large company. On the following day, the Council invited representatives of the over-seas Dominions to a reception and luncheon. The President, Sir Trevor Lawrence, again presided, and

amongst the speakers were Sir Daniel Morris, Sir Albert J. Gould, Sir Thomas Elliott, Sir Albert Rollit, and the Hon. C. H. Turner. On another page we print a list of those who accepted the Council's invitation, some of whom were, unfortunately, unable to be present.

British Botanists: The Rev. J. S. Henslow.

Among the names of botanists held in honour by horticulturists that of Henslow will always occupy a high place, and it is with particular pleasure that we give the following brief outline of the life and work of the Rev. Professor J. S. Henslow, inasmuch as it is based on the lecture in the series on British Botanists which was given recently by his son, the Rev. Professor G. Henslow. Of the credentials of the son, who holds so secure a place in the regard of horticulturists, it is unnecessary to speak, though much of the biography of the father applies with equal force to the descendant.

Like his son, the Rev. J. S. Henslow was a student of science for the love of science, and by no means confined himself to one branch. His contributions to knowledge covered a wide range, and included geological, entomological, as well as botanical investigations.

Born in 1796, Henslow became Professor of Mineralogy in the University of Cambridge at the comparatively early age of 26. After holding this chair for some five years he was, on the death of Professor Martyn, elected to the Professorship of Botany in the same university.

As his biographer makes clear, Henslow took no narrow view of botany, nor did he confine it in practice to the then all-important systematic branch of the science. Thus we find him stating explicitly that "to ascertain the geographical distribution of a well-known species is a point of vastly superior interest to the mere acquisition of a rare specimen." This assertion which no botanist would now dispute is of particular significance in connection with the well-known fact that it was Henslow who sent Charles Darwin on a world-wide quest—in the "Beagle"—not only to obtain information concerning geographical distributions, but of other biological truths of the highest importance to science.

One of Henslow's first activities on succeeding to the Chair of Botany at Cambridge was to secure a botanic garden more worthy of the university. The old garden was small, and it was situated in the centre of the town on the site of the present science museums. In 1831 the gardens were transferred to their present site, though it was not until 15 years later that the first tree was planted.

In 1838 Henslow became Rector of Hitcham, and evinced his life-long passion for natural history by lecturing to the neighbouring farmers on such subjects as manures. He endeavoured also to induce the farmers to test Liebig's recommendation that gypsum should be added to manure-heaps in order to fix

NERIUM ODORUM
IN THE NEW PARK, INDORE, CENTRAL INDIA.

the ammonia. Unfortunately, we have no record of the success which met these enlightened and pioneer efforts.

Henslow's geological knowledge led to his discovery, which proved of great value to agriculture, that certain deposits at Felixstowe and other places contain phosphate nodules, known now as coprolites. Samples of the nodules sent by Henslow to Mr. (later Sir) John Lewes led to the commercial exploitation of these deposits, which provided a rich supply of phosphatic manure.

In conclusion we cannot do better than requote the concluding words from the memoir of the Rev. John Stevens Henslow by the Rev. Leonard Jenyns: "When a good man dies the world does not cease to benefit from those labours of love which he undertook for his fellow men. Though personally removed from them, his example remains; his voice, too, is still heard in the lessons left to be handed

particularly well at Indore. It does best in an open position and is propagated either by division, by layers, or by cuttings planted here during the rainy season or cold weather. The shrub bears flowers almost throughout the year, but it is at its best stage of blooming from about the end of November to the end of April. The foliage is supposed to be poisonous to cattle and anti-malarious. There are varieties also in cultivation here, which bear single and double flowers of white, rosy-pink, and dark pink colours, but the blooms are comparatively small, though equally as showy as those of *N. odorum*. The plant is indigenous in certain valleys and ravines in the north of the State along streams, where it produces masses of pink, white and red blossom. It grows freely in sunny situations, and is largely cultivated in Central India as a background for herbaceous borders and in large beds grouped for effect. The accompanying photographs show a single specimen plant (see Supplementary Illustration) and a hedge of *N. odorum*, with a foreground of *Sanchezia* and *Galphimia* (see fig. 2). I write at the end of April, when the hot weather is well

an annual event. The outing took place this year on Friday, June 30, some 30 members and friends being present. Those who journeyed by train were met at Slough station by Mr. VEITCH, and the ride to the Park was delightful, even though the air was cold and the skies cloudy. On arrival at East Burnham Park, the members enjoyed a walk through the gardens, the sub-tropical and wild gardens being especially admired. At the luncheon Mr. WILLIAM MARSHALL, Chairman of the Floral Committee, proposed a cordial vote of thanks to Mr. and Mrs. VEITCH. The visitors then inspected the Rose and kitchen gardens, where many subjects of interest were seen. Afterwards a game of bowls was played by some of the visitors. A somewhat augmented company including Sir J. DILWYN LLEWELYN, Bart., and Lady LLEWELYN afterwards met at tea. Happily, the rain held off until the moment for the return journey.

BLACKBURN AND DISTRICT HORTICULTURAL SOCIETY.—In honour of the King's Coronation the Blackburn and District Horticultural Society

OLYMPIA SHOW.

(See p. 19.)

down to those who come after him. The influences of Professor Henslow's teaching have been felt in other places than those in which he taught, they have borne fruit far beyond the obscure neighbourhood in which he first sowed the good seed."

SUPPLEMENTARY ILLUSTRATION.—*Nerium odorum* is not so common in cultivation as *N. Oleander*, for, although the former species was grown in the Physic garden at Chelsea soon after 1680, the plant appears to have been lost to cultivation for some considerable time, and when re-introduced it was regarded as a novelty. *N. odorum* is a native of the East Indies, the other species being found in South Europe and the Levant. Our Supplementary Illustration shows a fine specimen of *N. odorum* growing in the New Park, Indore, Central India. Our correspondent sends us the following particulars: "Nerium odorum, an evergreen shrub bearing clusters of sweet, fragrant, double flowers of rosy pink colour, each 2 inches across, in clusters of from 50 to 80 flowers, thrives par-

established and flowers have ceased to bloom in most parts of India, but our park is still gay and bright with blossom. *Lagerstrœmia indica* is in great beauty in several beds, especially the white variety, though the pink and purple varieties are also beautiful. *Galphimia* and the *Poinciana* shrubs (red and yellow), the common yellow *Tecoma*, *Lantanas* of various colours, and the pure white *Tabernæ montana* are all showy subjects at present in bloom. This park has been established not yet quite two years, but it is already a favourite resort for people of all classes. Roses and annuals have made a great show this season, and are scarcely yet over, whilst the collection of flowering shrubs and climbers is large and varied. A small pond recently excavated is already full of the lovely *Nymphæa* (Lotus), which is producing its large, pink blossoms in abundance."

R.H.S. COMMITTEES' OUTING TO EAST BURNHAM PARK.—The visit of the R.H.S. Committees to East Burnham Park, Slough, the residence of Mr. HARRY J. VEITCH, has become

provided buttonholes of Sweet Peas for 450 of the gentlemen who took part in the civic procession to the parish church on Coronation Day.

PYRUS USSURIENSIS AS A STOCK FOR PEARS.

—Attention is drawn in the "Commonplace Notes" of the *Journal* of the Royal Horticultural Society (May, 1911), to the widespread use abroad of *Pyrus ussuriensis* (*P. sinensis*) as a Pear-stock. The species is common in the north island of Japan, whence seed is distributed, particularly to America, which country takes as much as 1,500 lbs. of seed of *P. ussuriensis* per annum. The writer of the note professes himself somewhat sceptical as to the merits of the stock, which is described as "a strong, healthy, vigorous-growing tree, with good foliage, calculated to withstand diseases and pests"; but he recommends that this stock should receive a trial in this country.

PUBLICATIONS RECEIVED.—*A Report on the Agriculture and Soils of Kent, Surrey, and Sussex*, by A. D. Hall, M.A., F.R.S., and E. J. Russell, D.Sc. (Board of Agriculture and Fisheries, 4, Whitehall Place, S.W.) Price 2s. 6d.

ROYAL HORTICULTURAL SOCIETY.

Summer Show at Olympia.

JULY 4, 5, 6.—The great summer show of the Royal Horticultural Society has been held this year at Olympia, Addison Road, Kensington.

Although the beautiful setting of the grounds of Holland Park was greatly missed, the new site provided certain advantages. There was, for instance, ample room, as well as abundant light, and the building allowed a better grouping of the exhibits, although this advantage was not put to the best use. Where the least formality of arrangement was observed—we refer now to the spacious annexe—there the best effects were produced. Indeed, the magnificent gardens arranged by Messrs. WALLACE, CARTER, CHEAL, CUTBUSH and BUNYARD in that part of the show were very beautiful. The tiers of staging in the main building gave a sense of too much formality, and the Society cannot apparently get away from the straight, formal table arrangement which obtains at all their exhibitions. Plants and flowers never appear so beautiful as when a natural arrangement is attempted, for when they are set out, as in a market, much of the effect is sacrificed. A few floor groups in the centre of the main building would have given a touch of the picturesque, which was lacking.

The great glass roof of the building required a light shading material, which, placed low down, would have hidden much of the ironwork of the building, and thrown the flowers into greater prominence.

Outstanding novelties in the exhibition were few, and Orchids less important than is usual at these shows. Hardy flowers were shown in greater numbers than ever, the rock and water gardens being especial features, whilst Stove plants, Roses, Carnations, Sweet Peas, Delphiniums, and Ferns were represented by imposing displays.

The president, Sir Trevor Lawrence, Bart., presided, on Tuesday last, at the usual complimentary luncheon offered to the judges and members of Committees, when speeches were delivered by the president and by Sir John Dilwyn Llewelyn, Mr. C. G. A. Nix, and Mr. W. Cuthbertson.

The organisation of a show of this character, on a fresh site and therefore in new conditions, involves a great amount of extra work for the Society's officials, but each and all did their utmost to make the event successful. For ourselves, we are especially indebted to Mr. Gaskell, Mr. Wright, Mr. Reader, and Mr. Plowman for their courtesy and help on this as on other occasions.

FLORAL COMMITTEE.

Present: W. Marshall, Esq. (in the Chair); and Messrs. T. W. Turner, R. C. Reginald Nevill, W. J. James, John Dickson, J. T. Bennett-Poë, J. Herbert Cutbush, H. J. Jones, W. P. Thomson, G. Reuthe, W. J. Bean, John Green, George Paul, W. B. Cranfield, Jas. Douglas, W. G. Baker, and C. R. Fielder.

ROSES.

Messrs. S. BIDE & SONS, Ltd., Alma Nurseries, Farnham, Surrey, showed a collection of Roses in the gallery, which suffered badly from a draughty, exposed position. The best varieties included Liberty, Betty, Harry Kirk, Una, K. A. Victoria and Irish Elegance.

Messrs. W. & J. BROWN, Peterborough, staged three show boards of Roses, each with 24 blooms, in variety. Dean Hole was especially good.

Messrs. CANNELL & SONS, Swanley, Kent, showed a beautiful plant of American Pillar Rose carrying on one spray 125 buds and flowers.

Messrs. BEN. R. CANT & SONS, The Old Rose Gardens, Colchester, showed a representative group of Roses. A background was made with

Rosa macrantha, Gustave Regis, Claire Jacquier, The Garland, and Elush Rambler. G. C. Waud, Mrs. Peter Blair, Hugh Dickson, Mme. M. Soupert and other sorts were shown well in bamboo stands, and Mrs. O. G. Orpen, Commandeur Jules Gravereaux, Perle d'Or and Juliet in vases. A number of exhibition Roses arranged on boards were also included in the group.

Messrs. FRANK CANT & Co., Braiswick Rose Gardens, Colchester, staged a beautiful central bamboo stand of the Lyon Rose and fine vases of Le Progrès, Tuscany, Rouge Angevine, Gottfried Keller and Mme. Alfred Tate. At the back were the varieties Débutante, Excelsa, René André, and Sweetheart, and in the front five exhibition boxes, each containing 24 blooms of miscellaneous varieties.

Messrs. W. CUTBUSH & SONS, Highgate, N., included Jessie, Orleans Rose and Hiawatha in their effective display of Carnations and foliage plants.

Messrs. A. DICKSON & SONS, Ltd., Newtownards, made a good display with 25 large

A. Chatenay, Edu Meyer, Mme. Ravary and Lyon Rose; also excellent blooms in vases of Irish Elegance, Irish Glory, Lady Hillingdon and Duchess of Wellington. The group suffered somewhat from the want of a suitable background.

Messrs. HOBBIES, Ltd., Dereham, Norfolk, arranged a large group of Roses in the annexe to illustrate the decorative value of the ramblers in covering temples, arches and pergolas. American Pillar, Hiawatha, Excelsa, and White Dorothy Perkins were well shown, but the galvanized ironwork was too conspicuous.

Messrs. GEO. JACKMAN & SON, Woking Nurseries, Surrey, arranged a group of Roses in the gallery, which included the varieties Alberic Barbier, Lyon Rose, Mrs. Aaron Ward and Duchess of Wellington.

Mr. PHILIP LE CORNU, High View Nurseries, Jersey, displayed two stands of the new-Cherry-Rose-coloured Hybrid Tea Rose Mrs. Philip Le Cornu, which showed to advantage against a black-velvet background.

OLYMPIA SHOW.

FIG. 8.—PERGOLA SHOWN BY MESSRS. PULHAM AND SON.

(See p. 16.)

bamboo stands of new Roses and a number of vases. The choicer varieties included Firebrand (single), Mrs. Fred. Straker, Viscount Carlow, Carine, Duchess of Wellington, Dorothy Page Roberts, Mrs. Cornwallis West, Mrs. Leonard Petrie, and H. V. Machin.

Messrs. HUGH DICKSON, Royal Nurseries, Belfast, in a group staged in the gallery, showed a unique collection, of which every bloom represented a variety of their own raising. Mrs. E. Allen and Leslie Holland secured Awards. Mrs. Sam Ross (flesh) and George V. (crimson-purple) were especially good. Lady Pirrie, Countess of Shaftesbury, Mrs. R. D. McClure, and W. K. Hendrick were also very finely shown.

Messrs. R. HARKNESS & Co, Hitchin, staged bamboo stands filled with good blooms of Mme.

Messrs. STUART LOW & Co., Bush Hill Park, Middlesex, staged one of the most tastefully-arranged groups of Roses. Moss-covered columns furnished with Lyon Rose and Mme. A. Chatenay were particularly good. Other stands included the varieties Killarney, Mme. Ravary, Frau K. Druschki, Duchess of Wellington, and White Killarney, and there were also vases and bowls of Gräfin Zeppelin and Marquise de Sinety.

Mr. JOHN MATTOCK, New Headington, Oxford, arranged an interesting collection of Roses in the gallery. The background of Ramblers included Rubin, Mrs. Flight, The Garland and Bennett's Seedling. Lady Curzon, Simplicity, Hebe's Lip and Crimson Damask were well shown on bamboo stands, and Belle Fleur and Marie van Houtte in vases.

Mr. R. C. NOTCUTT, Woodbridge, Suffolk, showed some good Roses on the tiered staging. The best varieties included Gottfried Keller, Rosette of the Legion of Honour (pillar), Mrs. Aaron Ward, Geo. C. Waud, and Souvenir de Stella Gray.

Messrs. PAUL & SON, The Old Nurseries, Chess-hunt, arranged a representative group in the annexe. A hedge of Leuchstern was admired with some plants of old Crimson Moss. Paul Transon, Goldfinch, Rubin, François Foucard, Robert Craig and Blush Rambler were the best Ramblers. Triangular beds contained Pharisaer, Irish Glory, Mme. T. Roosevelt, Rev. A. Cheales, and Sénateur Marcurand. The centre bed was a striking arrangement of Shower of Gold, around the base of which were planted Jessie and Orleans Rose.

Messrs. WM. PAUL & SON, Ltd., Waltham Cross, exhibited the most important collection of Roses in the show. Standards of Hiawatha, Dorothy Perkins, Lady Gay and Tausendschön were effectively arranged in a carpet of Aschen-

ianas. Flame, Elisa Robichon and Rubin were also well shown.

Messrs. A. A. WALTERS & SON, Kensington Nurseries, Bath, showed Blush Rambler, Alberic Barbier, and a number of Hybrid Tea varieties.

Mr. CHRISTOPH WEIGAND, Soden a/Taunus, Germany, showed a few plants of the variety Sodenia, which is claimed to be a carmine-red Dorothy Perkins with all the other good attributes of that well-known variety.

CARNATIONS.

Messrs. R. H. BATH, LTD., Floral Farms, Wisbech, staged Winsor, White Enchantress, President and a few other varieties of Carnations.

Mr. BERTIE E. BELL, Castel Nursery, Guernsey, made a pretty display with a good collection of perpetual-flowering Carnations, including Alma Ward, Mrs. C. W. Ward, J. W. Riley, Bay State, Mikado, and Rose Doré. The tasteful arrangement in white baskets against a background of silver-grey produced an excellent effect.

and many other of Mr. DOUGLAS's seedlings were included in the exhibit.

Mr. A. F. DUTTON, Iver, Buckinghamshire, showed a good collection of perpetual-flowering Carnations White Fair Maid, Alvina, President Seelye, Rose Doré, also a few Souvenir de la Malmaison varieties, including Maggie Hodgson and Princess of Wales.

Mr. C. ENGELMANN, Saffron Walden, Essex, staged blooms of Carnations Carola, May Day, La Mode, Harlequin, Rex, Gloriosa, Beacon and others in fine form.

W. M. GOTT, Esq., Trenyhton, Par Station, Cornwall (gr. Mr. G. Hillman), had an appropriate centre-piece of Carnations Mrs. Trelawney, and showed other good blooms of Princess of Wales, The Queen, Yaller Gal, Thora, Mercia, Monk and other Souvenir de la Malmaison varieties.

E. J. JOHNSTONE, Esq., Burr Wood, Groombridge, Kent (gr. Mr. A. T. Paskett), made one of the most effective displays of colour in the hall on the tiered staging with plants of the pink

OLYMPIA SHOW.

FIG. 9.—GENERAL VIEW OF THE EXHIBITION AS SEEN FROM THE GALLERY.

brödel, Jessie, Cecile Brunner, Orleans and other dwarf Polyantha varieties. A fine background was made with Ramblers and tall Standards—Lady Gay, Hiawatha, Paradise, Delight, Milky Way and White Dorothy. The foreground was filled with baskets of Hybrid Teas, including Elaine, Cynthia, Geo. C. Waud, Arthur Goodwin, Lady Downe, and Frances Charteris Seton.

Mr. GEO. PRINCE, Oxford, staged many fine Hybrid Teas, including Souvenir de Stella Gray and White Killarney, and Molly S. Crawford, with a background of Ramblers. Mildred Blackburne is a new, small-flowered, and very vigorous seedling H.T.

Mr. CHAS. TURNER, Slough, showed a group of Roses on the tiered staging, which included a number of new seedlings. The soft-pink-flowered seedlings of R. Brunonis and the Damask Rose were exceedingly pretty. Coronation (bright crimson), and Edith (pink) were new Wichura-

ianas. Flame, Elisa Robichon and Rubin were also well shown. Mr. H. BURNETT, Guernsey, had a fine centre-piece of Carnations R. F. Felton, flanked by Mikado on either side, and with the white Niagara and the yellow-ground Fancy Orpheus below. The variety Mrs. C. F. Raphael was particularly good, and Marmion, Afterglow, Vulcan and Mrs. C. W. Ward were also noticeable.

Messrs. H. CUTBUSH & SONS, Highgate, showed the new Malmaison Viscountess Goschen, also Princess of Wales, Monk, Yaller Gall, and O. P. Bassett of this type, together with the white Alma Ward, May Day, Fortuna and other perpetual-flowering varieties. The whole group was very tastefully arranged with Codiaëums (Crotons) and other foliage plants.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, showed a fine collection of border varieties of Carnations. Elizabeth Shifner, The Golfer, Mrs. Berkeley, Hercules, Mrs. R. Gordon, Helen Countess of Radnor, Ellen Douglas, John Ridd

Princess of Wales and a few clumps of the crimson H. J. Jones Carnations. The plants were mostly two to three years old in 10-inch pots and carried some very fine flowers. On the 3-feet staging White Perfection, Royal Purple, May Day and other perpetual-flowering varieties were arranged.

Mr. H. LAKEMAN, Thornton Heath, Surrey, arranged 27 vases of border Carnations. Lady Hermione, Sir Galahad, Linkman, The King, Miss Willmott, Queen Alexandra and Ellen Douglas were the most distinct varieties.

Mr. G. LANGE, Hampton, made a good display with market perpetual-flowering varieties of Carnations arranged in glass vases. The varieties Red Lawson, Beacon, Fair Maid, Aristocrat and Britannia were included.

Messrs. STUART LOW & Co., Bush Hill Park, arranged one of the most decorative displays of Carnations with a good use of Nephrolepis and

other Ferns and hanging baskets. The varieties included the new orange "Malmaison" Lady Mary Hope, the pink Irene, the soft pink-flaked Maggie Nettlefield, The Colonel, King Oscar, C. E. Little and other good sorts, in addition to the standard varieties of the American Carnation.

FRANK MAY, Esq., Houndswood, Radlett, Herts. (gr. Mr. T. F. Stannett), showed a collection of Souvenir de la Malmaison Carnations which were arranged in a semi-circular group. Princess of Wales was the leading variety, but Maggie Hodgson, Cecilia, Dragut, Mrs. Trelawney and Houndswood Beauty were also well shown.

THE SOMERFORD NURSERIES, Christchurch, showed a small group of Carnations prettily arranged in wicker baskets, the white blooms in a brown basket and the pink blooms in white baskets looking especially well.

THE THATCHAM FRUIT AND FLOWER FARM, near Newbury, arranged a prettily group of Carna-

all shown to advantage in a tasteful arrangement with Smilax.

Mr. J. D. WEBSTER, Market Avenue, Chichester, showed a small group which included the varieties Mikado, Winona and Delight.

Messrs. YOUNG & Co., Cheltenham, displayed collections of perpetual-flowering Carnations such as White Perfection, Hon. Lady Audley Neeld, Cheltonia, and Mrs. Greswolde Williams.

BEGONIAS AND GLOXINIAS.

Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath, staged a rich collection of tuberous-rooted Begonias. The varieties Lena, Fleur de Chrysanthème, and Mrs. Bilkie appeared to advantage in baskets. A strain of frilled singles was included, and of the doubles Rose Superb, Lady Tweedmouth, and Mamie Warburton (pink and salmon), George Pike and Royal George (scarlet), Mrs. W. L. Ainslie, and M. Gwillim (yellow), and Florence Nightingale

Mr. A. LL. Gwillim, Cambria Nursery, Sidcup, Kent, showed a collection of tuberous-rooted Begonias carefully arranged in a colour scheme, in which the white varieties were associated with pinks and salmons, and the yellow varieties with orange and scarlet, the groups being separated by a batch of single-flowered varieties. Avalanche, Ringwood Peach, Sultan, Primrose, Miss Muriel, Edwardson, Mrs. H. Harris, and M. Gwillim were among the choicest sorts included.

Messrs. JOHN PEED & SON, Mitcham Lane, Streatham, showed a choice strain of Gloxinias in many colour varieties, and a good batch of Streptocarpuses, the group being relieved with a free use of Nephrolepis Ferns.

Messrs. T. S. WARE, Ltd., Feltham, Middlesex, sent a large collection of tuberous-rooted Begonias with a wide colour range. The feature of the group was the large batch of the lovely pink Lady Cromer variety. The salmon and pink varieties included Maud Nickells, Capt. Lafone,

OLYMPIA SHOW.

FIG. 10.—MESSRS. H. B. MAY AND SONS' GROUP OF FERNS: AWARDED THE "CORONATION" CUP.

tions relieved with a free use of Asparagus plumosus and having a background of green velvet. Standard varieties such as Rose Doré, Winsor and Enchantress were employed.

Mr. CHAS. TURNER, Slough, made a good display of "Malmaison" Carnations of the varieties Princess of Wales, Maggie Hodgson, Mrs. Trelawney, Lady Middleton and Blush.

Messrs. J. VEITCH & SONS, LTD., Chelsea, showed a number of Souvenir de la Malmaison varieties, including Dragut, Lady Coventry, Souvenir de la Malmaison, Mrs. Trelawney and Princess of Wales.

Mr. C. F. WATERS, Balcombe, Sussex, showed a valuable collection of perpetual-flowering varieties of Carnations, of which Edith Waters (cerise) was the most distinct and good. Aurora, Mikado, Britannia and White Perfection were

Avalanche, Beatrice Mabbett, and Eileen Fitzgerald (white) were, perhaps, the choicest examples.

Messrs. H. CANNELL & SONS, Swanley, Kent, made a very ornamental display of tuberous-rooted Begonias, of which the chief feature was the fine collection of whites in the centre—Snowdon, Her Majesty, Polar Star and Countess of Ross in a setting of Adiantum Ferns. Salmon and pinks were placed right and left, and at the ends the yellow and orange Sunset and Sunflower. The scarlet bedder Washington over variegated Funkias made a good edging to the group.

Messrs. JAMES CARTER & Co., Raynes Park, staged a decorative group of double Begonias, Gloxinias, Petunias, Streptocarpuses and yellow-flowered Richardias.

Pink Pearl, Mrs. J. B. Blackmore and Lady Ebury. Mrs. W. Ainslie was the best yellow variety. Scarlets were represented by Patrick Ainslie and Miss F. Harmar. Strains of crested singles (cristata) and frilled (crispa) varieties were also included in the group.

FERNS.

The Coronation Challenge Cup for the most meritorious exhibit at the show was awarded to Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, for a magnificent collection of Ferns. The centre of the stand was occupied by a group of Nephrolepis Marshallii compacta, arranged in the form of a circular shield. This delicately-beautiful Fern was a mass of billowy verdure, a veritable triumph of cultural skill. A few tall

Tree-Ferns (*Dicksonia squarrosa* and *Hemitelia Smithii*) and many slender pillars of *Lygodium* (chiefly *L. japonicum*) trained on Bamboo stakes stood well up from the mass of more lowly-growing Ferns and rendered the group very light and pleasing. Here and there such choice examples as *Nephrolepis Neubertii*, *Athyrium plumosum axminsterense*, *Nephrolepis superbissima*, *Drymoglossum spathulatum*, with strange-looking un-Fern-like fronds, *Gymnogramme schizophylla gloriosa*, *G. elegantissima* and *Nephrolepis Amerpohlii* were raised to catch the eye. Besides the *Drymoglossum* named, other examples of uncommon form were *Polypodium vacciniifolium album*; *Adiantum asarifolium*, which may be described as having single fleshy pinnæ 2 to 4 inches across, arranged on very slender stalks; *Deparia Moorei*, *Davallia tenuifolia Veitchii*, *Polypodium*, *Xiphias*, and *Hymenodium crinitum* with entire fronds 10 inches long by 7 inches broad, and having long, brown hairs on each surface. Amongst other Ferns were *Athyrium filix-femina gemmatum*, *A. f. f. congestum grandiceps*, and *Nephrolepis Mayi cristata*. *Brainea insignis* has brightly-coloured young fronds, as also has *Adiantum Veitchii*. *Adiantum macrophyllum* has perhaps the brightest-coloured young fronds of all, with those of *A. pulverulenta* coming second.

At the far end of the annexe Messrs. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, had an enormous group of Ferns. Tall Tree-Ferns, such as *Cibotium Schiedeii*, *Dicksonia antarctica*, *D. squarrosa*, *Hemitelia Smithii* and *Cyathea dealbata*, with broad heads, towered at the back, and dwarfer sorts, such as *Blechnum brasiliense* and *Lomaria attenuata*, rose up from a groundwork of terrestrial Ferns. One would not unreasonably expect a group composed solely of Ferns to be simply made up of shades of green, but in the group under notice there was plenty of colour variety besides that given by the very dark green of *Davallia pentaphylla* and *D. fijiensis*, leading through the medium shades of *Dicksonia Barometz* (of which a fine clump was shown), *Polypodium Knightiæ*, and on to the lighter greens of *Nephrolepis Whitmannii*, or the young fronds of *Adiantums* of many kinds. Bright colour was given by the young fronds of May Ferns, such as *Davallia retusa*, *Blechnum latifolium*, *B. insignis*, *Adiantum Veitchianum* and *A. Hendersonii*. The "Gold" and "Silver" Ferns (*Gymnogrammes*) all lent their aid in this colour scheme, and *Litobrochia Vespertilionis* supplied a glaucous tone.

In the East Gallery Mr. H. N. ELLISON, Bull Street, West Bromwich, staged a neat arrangement of Ferns and *Dracænas*. The best of the well-grown Ferns were *Davallia tenuifolia Veitchii*, *D. epiphylla*, *Polypodium glaucum crispum*, and *Nephrolepis lycopodioides*.

SWEET PEAS.

Mr. W. E. ALSEN, Denmead, Hampshire, showed some finely-grown Sweet Peas in 60 vases and stands. Money-maker, Minnie Furnell, Yellow King, Thos. Stevenson, Elsie Herbert, and Mrs. Hugh Dickson were the leading sorts.

Sir RANDOLPH L. BAKER, Bart., Ransdon, Blandford (gr. Mr. A. E. Usher), had some of the finest Sweet Peas in the show. Doris Usher, Nettie Jenkins, Isobel Malcolm, Lavender, George Herbert, Stirling Stent, and Etta Dyke were among the best varieties. Tall pillars, rising 8 feet from the table, were effective in giving variety to the arrangement.

Messrs. S. BIDE & SONS, Alma Nurseries, Farnham, Surrey, staged more than 70 vases of Sweet Peas, having Orange King, Dudley Lees, Florence Nightingale, Bertha Massey, and other standard varieties.

Mr. JAMES BOX, Lindfield, Sussex, made a large display of flowers arranged mainly in metal holders.

Mr. C. W. BREADMORE, High Street, Winchester, showed over 100 vases of the best varieties of Sweet Peas, Chas. Foster, Freda, Dazzler, Nettie Jenkins, Mrs. Townsend, Elsie Herbert, Mrs. C. W. Breadmore, Maud Holmes, and Princess Juliana being particularly good.

Messrs. JAMES CARTER & Co., Raynes Park, Wimbledon, made a pretty display of Sweet Peas in vases and bowls, having excellent bunches of Chas. Foster, True Lavender, Helen Grosvenor, Evelyn Hemus, Mrs. H. Dickson, and Earl Spencer.

Messrs. CARTER PAGE & Co., London Wall,

made a bold display with large clumps of the best sorts arranged on the tiered staging. Asta Ohn, Isobel Malcolm, Helen Lewis, Frank Dolby, James Grieve, Edrom Beauty, and Marjorie Linzee were all well shown.

Mr. WM. DEAL, Brooklands, Kelvedon, Essex, exhibited a small group of well-grown novelties.

Messrs. DOBBIE & Co., Edinburgh, made the richest display of Sweet Peas in the show. Tall stands filled with beautiful sprays of Lady Knox, Nubian, Mrs. Heslington, Edrom Beauty, Etta Dyke, and Red Star, and over 80 vases of the best varieties gave a gorgeous display of colours. Melba and Dobbie's Cream made a particularly beautiful association of tints. The group was relieved with a free use of Palms, Smilax, and Kochias.

Messrs. GILBERT & SON, Dyke, Bourne, Lincs., made a pretty display of Sweet Peas and Lilies in the gallery. Lady Florence Willoughby and Safrano were very good. The Lilies included *L. dalmaticum Catanii* and *L. album*.

Messrs. JARMAN & Co., Chard, Somerset, showed a number of unnamed varieties associated with their new Centaureas, Bridegroom, The Bride, and Honeymoon.

E. J. JOHNSTONE, Esq., Burrowswood, Groombridge, Kent (gr. Mr. A. T. Paskett), showed a collection, which, in addition to some good unnamed seedlings, included the varieties Mr. W. F. Unwin, Senator Spencer, Lavender Geo. Herbert, and Mrs. C. W. Breadmore.

OLYMPIA SHOW.

FIG. II.—CORONATION CHALLENGE CUP.

(Awarded to Messrs. H. B. May & Sons for a group of Ferns.)

Messrs. JONES & SONS, LTD., Coton Hill Nurseries, Shrewsbury, arranged 60 glass vases of Sweet Peas on 3-foot staging.

Messrs. KELWAY & SON, Langport, Somerset, erected a Bamboo pergola, which was rather unnaturally but very prettily decorated with Sweet Peas. Their best vases were furnished with blooms of Constance Oliver, Elsie Herbert, Evelyn Hemus, Paradise Ivory, Mrs. Townsend, and Mrs. C. W. Breadmore.

Messrs. E. W. KING & Co., Coggeshall, had a good stand of over 70 vases of Sweet Peas effectively arranged in masses of one colour. The Marquis, Mrs. Hardcastle Sykes, Evelyn Hemus, Anglian Orange, Anglian Blue, Queen Mary, Frank Dolby, and Clara Curtis were excellent.

Messrs. JOHN K. KING & SONS, Coggeshall, Essex, staged 50 vases of Sweet Peas in the gallery. Their best varieties were Mrs. H. Dickson, Queen of Spain Spencer, Edrom Beauty, Mrs. A. Malcolm, Paradise Ivory, and Harold.

Messrs. G. STARK & SON, Great Ryburgh, Norfolk, staged 50 stands of choice varieties, of which Madeline Cole, Lord Northcliffe, Mrs. C. W. Breadmore, Etta Dyke, and Loyalty were, perhaps, the most distinct.

Messrs. SUTTON & SONS, Reading, made a very

beautiful display, having bold columns of one colour and smaller batches of varieties arranged in "colour schemes," salmon and light blue, cream and mauve, &c. The varieties Southcote Beauty, Royal Rose, Doris Usher, Butterfly, Mrs. R. Hallam, and Elsie Herbert were outstandingly good.

Messrs. ROBERT SYDENHAM LIMITED, Tenby Street, Birmingham, arranged 50 stands, including such varieties as Maud Holmes, Emperor, Florence Nightingale, Edith Taylor, Thos. Stevenson, and Mrs. Hardcastle Sykes.

Messrs. E. WEBB & SONS, Wordsley, Stourbridge, arranged a large trophy of Sweet Peas as a centrepiece to their display of vegetables and fruit.

Other exhibitors of Sweet Peas were:—Mr. W. G. LAMBERT, Huntingdon; Mr. SAM LARKIN, Ridgways, Haslemere (gr. Mr. G. M. Hale); and Mr. J. D. WEBSTER, Chichester.

MISCELLANEOUS.

A Japanese garden provided by Messrs. JAMES CARTER & Co., Raynes Park, was an exhibition in itself. The design was exceedingly well conceived, and the garden so skilfully planted that, whilst there was no overcrowding of the various plants used, the plants had all the appearance of being fully established. At the entrance a fine Japanese umbrella Pine (*Sciadopitys verticillata*) towered up from a grassy mound. On one side was a quaint well with its rope and wooden bucket. Around the well stood dwarf Oaks, Larches and other trees growing in shallow pans, and apparently of great age. Stone lanterns and a six-tiered stone pagoda, mellowed with age, were skilfully placed, and around them were sufficient plants to prevent any suspicion of nakedness, but not enough to hide any essential portion of the structures. A winding lake, spanned by a wooden bridge, occupied the middle portion of the exhibit. The lake was supplied with water from a rocky elevation at one end, giving an air of reality to the garden. Fine groups of Iris Kämpferi, Bamboos in variety, weeping Birches, Japanese Maples, and various well-grown Conifers gave the whole an air of lightness and completeness. Bronze storks were silently fishing in the lake, and cleverly-trained birds of growing Larch mutely surveyed the scene.

Messrs. JAMES CARTER & Co. also filled a long space of tabling with a varied collection of flowering plants. At the end were fine hybrid Streptocarpus surrounding a few plants of tuberous-rooted Begonias with huge flowers of good form and bright colours. Also vases of excellent Sweet Peas, double-flowered Petunias and Arum Mrs. Roosevelt.

Messrs. JAMES VEITCH & SON'S, LTD., Chelsea, showed a group of foliage and flowering plants of exceeding beauty. Around tall Palms were nicely-graded mounds of choice flowering plants. The centre mound consisted of many gorgeous Orchids—*Laelio-Cattleyas*, *Cattleyas*, *Cypripediums*, *Oncidiums*, with an occasional plant of *Odontoglossum*, *Renanthera Imschootiana*, *Odontioda Cooksonii* and *Anguloa uniflora*. At each end stood a Pitcher plant, *Nepenthes Curtisii superba*, with a number of fine pitchers, and N. Sir William Thiselton-Dyer, with a smaller number of huge pitchers, raised on an *Asparagus Sprengeri* covered stand some 8 feet high, and around them were grouped *Solanum Wendlandii*. Near to the front were a couple of fine plants of *Aralia elegantissima*, surrounded with scarlet *Kalanchoë flammea*. The spaces between these raised groups were filled with such fine stove plants as *Alocasias*, *Dracænas*, *Codiaeums*, and some richly-coloured *Caladiums*. Towards the front there were some rare forms of *Begonia Rex* (B. Leontre, B. Bowringiana, B. The Queen, and B. Catherine Schmidt), a few plants of *Anthurium Scherzerianum* with enormous spathes, and a well-grown group of *Nephrolepis Marshallii compacta*. Messrs. VEITCH also furnished an uncommon arrangement of Fuchsias trained obliquely on a flat arrangement and brought together in pairs to represent the rafters of a glass-house. Beneath these were arranged small groups of flowering plants, such as *Streptocarpus*, "Malmaison" Carnations, dwarf Cannas, *Solanum Wendlandii*, *Exacum macranthum*, and a group of fine *Gloxinias*. *Begonia Washington*, a very dwarf, double-flowered, scarlet, tuberous-rooted variety, comprised the groundwork of a very attractive and an exceedingly meritorious exhibit.

Mr. L. R. RUSSELL, Richmond Nurseries, appears to stand quite alone as an Ivy specialist, and his exhibit of these plants was an especially fine one. It included a large variety of standard plants, well arranged with a groundwork of dwarfier plants, and bordered with a row of the variegated *Hedera elegantissima*. The standards, which are grafted on stout stems of the Irish Ivy, consisted chiefly of a number of *Hedera flavescens*, with plenty of golden leaves. Chief amongst the silver-leaved forms were *Hedera Helix maderensis variegata*, *H. elegantissima*, and *H. dentata variegata*. Amongst the green-leaved kinds, we noted *Hedera minima* with erect stems and small leaves, the weird conglomerate prostrate, and rhomboidea obovate. Mr. RUSSELL also staged a group of ornamental foliage plants, such as *Anthurium regale*, *A. crystallinum*, *Alocasia nobilis*, *A. Watsoniana*, *Cyanophyllum magnificum*, *Maranta Massangeana*, *M. insignis*, and *Aralia elegantissima*. This collection also contained such little stove gems as *Anæctochilus petola*, *A. intermedia*, *Sonerilla argentea*, densely-fruited *Nertera depressa*, and the bright-foliaged *Saxifraga sarmentosa tricolor*.

Messrs. FROMOW & SONS, Sutton Court Nurseries, Chiswick, contributed a splendid collection of Japanese Maples, for which they are noted, and other hardy shrubs. This exhibit occupied a space some 50 yards in circumference, and contained a large number of choice specimens. The colours of the Maples were admirably blended, and the judicious use of green and variegated-leaved Bamboos gave the group a most charming appearance. The most attractive Maples were *Acer palmatum versicolor*, *A. p. roseum marginatum*, *A. p. laciniatum*, *A. p. rufescens*, *A. p. septemlobum atro-purpureum*, *A. p. dissectum variegatum*, and *A. japonicum aureum*; and many uncommon shrubs were included in the group.

We are accustomed to see finely-grown Caladiums from Messrs. JOHN PEED & SON, West Norwood, and at this exhibition that firm's display was of a high standard of merit. Many of the varieties, although they had very large leaves, looked almost too delicate and fragile to be real. Messrs. PEED also set up a table in the gallery, filled with hybrid *Streptocarpus* and a very fine collection of *Gloxinias*. The *Gloxinias* bore large, fresh, erect flowers of many shades of colour.

Messrs. GEO. JACKMAN & SONS, Woking Nurseries, had a fine collection of all sections of *Clematis* arranged in a large semi-circle bordered with *Hydrangea hortensis* and *Adiantum* Ferns. Most striking amongst the many densely-flowered plants were King Edward VII. (pure-violet), Ville de Lyon (bright carmine-red), *ascotiensis* (large, azure-blue), *Jackmanii rubra*, La France (violet-purple), Marie Boisselot (large white), Mme. Grange (crimson-violet), Sensation (satin-mauve), Lady Northcliffe (a deep lavender-blue fading to a Cambridge blue), and Beauty of Worcester.

Messrs. J. CHEAL & SONS, Crawley, Sussex, occupied to good purpose a portion of the ground floor in the annexe. A substantial yet lightly-designed pergola, well covered with cluster Roses, *Clematis*, vines, and Ivies, ran nearly the whole length of the space allotted to them. Parallel with the pergola were arranged groups of ornamental foliage and flowering trees and shrubs, including *Quercus concordia* and *Gleditschia japonica*. At the end was a lightly-arranged rock-garden surrounding a wooden summerhouse. Conspicuous amongst the rock plants were *Lythrum elatum*, *Potentilla formosa*, *Campanula turbinata grandiflora*, an English Iris "La Jolie," and the large-flowered *Lychnis Haageana*.

Mr. V. SLADE, Staplegrove Nursery, Taunton, contributed a bright collection of cut blooms of Zonal and Ivy-leaved *Pelargoniums*. There was a wide range of clear and distinct shades of colour. The new Ivy-leaved variety Miss Popham supplied a new shade of colour, being bright pink with tinges of terra-cotta at the base of the petals.

Messrs. H. J. JONES, Ryecroft Nursery, Lewisham, had one of the brightest-coloured exhibits at the show. It consisted of a broad band of large-headed *Phlox* fronted with a very fine collection of Zonal *Pelargoniums*.

New hybrid *Acalyphas* and *Fuchsias* were shown by Mr. GEBRÜDER TEUPEL, Quedlinburg, Germany. The best of the *Acalyphas*, which were of the *A. hispida* type, but lacking the

bright colour of that species, was *A. camphauseniana*.

Messrs. JULIUS HANSEN, Pinneberg, Germany, brought a selection of dormant Lily of the Valley crowns of various grades and Dog Briar seedlings (*Rosa canina*), so much used in Germany as a Rose stock. The same firm also showed a working model of the machine used in most nurseries in Germany for packing dormant trees and shrubs.

Mr. PHILIP MARTINEAU, Twyford, Berks., arranged a small group of uncommon-coloured biennial *Salvias*.

Messrs. CUTBUSH & SON and Messrs. J. PIPER & SON showed good examples of topiary work.

Mr. CARLTON WHITE, New Bond Street, London, had a smaller and less trim collection of clipped trees and shrubs.

HARDY PLANTS.

Mr. MAURICE PRICHARD, Christchurch, Hampshire, arranged a more or less kidney-shaped exhibit of hardy plants, grouping it freely with bold masses of *Iris lœvigata* (Kämpferi), *Day-lilies*, *Kniphofias*, *Spiræas*, such as *S. palmata* and *S. Aruncus*, *Thalictrums*, and Bamboos, all of which were very suggestive of the water-side garden it was intended to be. Water plants were freely introduced into the pools, and bold border plants gave a rich display of colour, whilst grasses afforded lightness and elegance to the whole. The group was of a very imposing character.

A magnificent terrace, wall, rock and water-garden, with sumptuous herbaceous borders, designed and arranged by Messrs. R. WALLACE & CO., Colchester, was one of the most attractive features of this exhibition. Grassed banks and meandering streams, with Water Lilies and waterside planting, first met the eye. Following these came a low retaining wall, supporting the terrace garden above, while on all sides was a splendid array of border plants, giving colour, variety, and beauty to the whole. On a painted background was a replica of a recently-erected pergola, blending well into the general scheme. Hemmed by Conifers, here was gardening in the truest sense in every direction. The whole idea was admirably conceived and well carried out.

Not far away from this exhibit Messrs. WM. CUTBUSH & SONS, Highgate, had, in a more open space, set up an exhibit of bold water-gardening and waterside planting, the boldest and most imposing of this particular phase of gardening to be found in the exhibition. Huge Gunneras, Bamboos, *Senecios* of giant stature, masses of Ferns and Japanese Irises all played their part in the general arrangement; while Water Lilies abounded in variety and beauty in well-arranged pools. Lilies were a great feature among flowering plants, and among a large number we remarked splendid examples of *L. giganteum*, *L. Henryi*, *L. Brownii*, *L. pardalinum*, and *L. superbum*. At the opposite side, and quite hidden by banks of other subjects, was a border of hardy herbaceous plants.

Of quite a different character still, for, as though by some pre-arranged motive, no two exhibits were alike, was a rock-garden, Fernery, and pergola, displayed by Messrs. PULHAM & SON, Oxford Street, London, the like of which we have never seen finer or more naturally executed. Whether the pergola (see fig. 8), paved walk, the disposition of great masses of sandstone rock, or the planting in general of shrub, rock, or flowering plant, they were all happily associated and in pleasing harmony.

In still another direction in the spacious annexe, Messrs. J. CHEAL & SONS, Crawley, set up an excellent rock-garden exhibit in sandstone, together with pergola, border, summerhouses, and the like, planting the former with fine groups of *Potentillas*, *Primula capitata*, the handsome *Sedum Mawianum*, *Gypsophila prostrata rosea*, *Alströméria revoluta*, with flowers of a rich shade of orange, *A. chilensis*, and other suitable subjects.

Messrs. G. BUNYARD & CO., LTD., Maidstone, exhibited a flower border in conjunction with a water-garden. The result was in every respect excellent. The water garden was the feature of this exhibit, the masses of Water Lilies being most effectively arranged. *Delphiniums* were finely shown, the most conspicuous being the variety Rev. E. Lascelles. *Astilbes* were grouped near the water, and numerous choice Alpines,

with the rare *Pinus Montezeuma* and *Carpenteria californica*, were included in the exhibit.

At the other extreme of the annexe Messrs. T. S. WARE, LTD., Feltham, arranged a rock and water garden, covering a space of 1,200 square feet, arranging and grouping in delightful fashion a remarkable variety of plants. Most striking of all, perhaps, was the lovely pink-flowered *Erythræa diffusa*, though not less delightful was an admirable grouping of *Hypericum ceris*, the Heath-like shoots terminating in golden-yellow flowers. *Sempervivums*, covered with a cobweb-like growth, were set in horizontal fissures of the rockwork, and hardy Ferns were employed in a similar manner.

In quite a cool and shaded spot beneath a balcony Messrs. H. J. JONES & CO., LTD., Lewisham, had a rich display of herbaceous *Phloxes*, admirably grown, and showing to considerable advantage. Elizabeth Campbell (soft pink), Antoine Mercier (mauve and white), Selma (light salmon), Frau Antoine Buckner (snow-white), Meteore (rosy-pink), and Dr. Charcot (deep heliotrope) are a representative set of the best of these plants.

Messrs. R. H. BATH, LTD., Wisbech, had a rich display of *Delphiniums*, the rich blue and white of Rev. E. Lascelles constituting one of the more conspicuous variety of a large and representative gathering.

Messrs. LILLEY & CO., Guernsey, were the exhibitors of a great variety of Japanese Irises and early *Gladioli*.

Messrs. RICH & CO., Bath, displayed *Phloxes*, *Pentstemons*, *Scabiosa caucasica*, and other hardy flowers.

Mr. W. J. GODFREY, Exmouth, staged a particularly good strain of *Campanula medium* (Canterbury Bells), the flowers varying greatly in colouring.

Misses HOPKINS, Shepperton-on-Thames, on one of the side stands in the great hall, arranged a pleasing rock and water-garden exhibit.

Messrs. HEATH & SONS, Cheltenham, had a capital rock-garden group, with waterpools here and there.

Mr. CLARENCE ELLIOTT, Stevenage, arranged a rock-garden exhibit on staging in a more central position, and employed many excellent plants, including *Campanula pusilla* Miss Willmott, of pale blue colour, and the rare and distinct sub-shrubby *Sedum Liebmannianum*.

A magnificent display of *Larkspurs* (*Delphiniums*) was arranged by Mr. AMOS PERRY, Enfield, on either side of the great hall, a great blue cloud of flowers, at once startling in its brilliancy and effective in the extreme. A year ago Mr. PERRY had his "Blue tent" at Holland Park, but, under canvas, the brilliant picture was lost; whereas now it was superb and imposing a couple of hundred yards away.

Mr. H. HEMSLEY, Crawley, had many interesting plants on rockwork near the entrance to the building, of which *Artemisia frigida*, *Æthionema* species, with pink flowers, *Primula Littioniana*, *Geum rheticum*, and *Erythroxia diffusa* are a few of the more interesting species.

Mr. G. REUTHE, Keston, Kent, showed a delightful exhibit of Alpine plants and shrubs. *Erica cinerea*, *Allium narcissiflorum*, *Campanula Raddeana*, *Acantholimon venustum* with Lilies, *Desfontainia spinosa* and *Mitralia coccinea* being noted in the group. Most interesting of all perhaps was the yellow-flowered, red-stemmed *Saxifraga Brunoniana*, while *Primula suffruticosa* was among the most rare.

Messrs. BARR & SONS, Covent Garden, had an extensive grouping of *Delphiniums*, *Salvias*, and *Campanulas*.

Mr. J. Box, Lindfield, showed early *Gladioli*, *Larkspurs*, *Eremuri*, *Pentstemons*, *Verbas-cums*, and Irises, all in great variety.

Messrs. GUNN & SONS, Olton, Birmingham, staged one of the best groups of herbaceous *Phloxes* we have seen. The flowers were most brilliant in effect and admirably displayed, such varieties as May Campbell (pale pink), Meteore (salmon), Tapis Blanc, Iris, and Le Mahdi being remarked in a really splendid collection.

Not one of the largest, but certainly one of the most interesting exhibits in this section was the delightful Alpine group from the CRAVEN NURSERY, Clapham, Lancaster, a little moraine garden containing *Campanula cæspitosa pallida*, *C. Zoyssii*, *C. speciosa*, *Silene pusilla*, a veritable miniature of *S. alpestris*, *Saxifraga aizoides*

aurantiaca, Hypericum olympicum, and many others.

A collection of Delphiniums, staged by Messrs. KELWAY & SON, Langport, was in every way admirable, and occupied two tables in the centre of the hall. The exhibit was one of great merit, and contained such fine varieties as Beauty of Langport, Geneva, and others.

Messrs. WHITELEGG & PAGE, Chislehurst, had a great bank of hardy flowers in variety.

Mr. HOWARD CRANE, Highgate, N., showed Violas and Violettas in pans of sand and water; this method of exhibiting them retaining the character as well as the utility of the subject. Such Violettas as Eileen, Forget-me-Not, Grace, Diana, Rock Blue, Rock Yellow, and Miss G. Jekyll were delightfully pretty.

Messrs. SEAGRAVE & Co., Sheffield, displayed Violas and Pansies in bunches, but the flowers soon lost their freshness and beauty in the great heat.

Messrs. B. LADHAMS, LTD., Southampton, staged Pinks, Salvias, Gaillardias, Iris laevigata Rose Queen, Dianthus Marie Parc, and D. Napoleon III.

Messrs. G. & A. CLARK, LTD., Dover, had a most extensive table arrangement of hardy flowers, Alpines, and water Lilies.

The LOCKSHEATH NURSERIES, LTD., Southampton, showed many hardy cut flowers.

Mr. R. C. NOTCUTT, Woodbridge, arranged hardy flowers with his exhibit of Roses.

Messrs. PHILLIPS & TAYLOR, Bracknell; F. SMITH & Co., Woodbridge; and GILBERT & SON, Bourne, Lincs., were also exhibitors of hardy plants or flowers.

AWARDS.

AWARDS OF MERIT.

Dracæna deremensis Warneckii.—An ornamental-foliaged plant, having leaves about 1 foot in length and 2 inches in breadth, of a

of rose. The flowers are produced five or six in a truss. Shown by Mr. W. TRESEDER, Cardiff.

Rose Frances Charteris Seton.—A cherry-rose-coloured Hybrid Tea variety, of good form, with recurving outer petals. The buds are pointed. The plant is said, by the raisers, to be a strong grower. Shown by Messrs. WM. PAUL & SON, Waltham Cross.

Rose Leslie Holland.—A rich crimson Hybrid Tea variety, with a touch of purple on the petals, suggesting a H.P. variety. The flowers are of good substance, and the flower-buds long. The blooms retain their good shape unusually well. Shown by Mr. HUGH DICKSON, Belfast.

Rose Mrs. Chas. E. Allan.—A rich, apricot-tinted variety, of good form, with pretty, recurving petals. The blooms do not possess much substance, but the plant is free in flowering and of vigorous habit. Shown by Mr. HUGH DICKSON.

OLYMPIA SHOW.

FIG. 12.—EXHIBIT OF FINE FOLIAGE PLANTS: SHOWN BY MESSRS. JAMES VEITCH AND SONS.

(See p. 15.)

The GUILDFORD HARDY PLANT NURSERY had showy masses of *Primula capitata*, *Neiremburgia rivularis*, *Sidalcea Listeri*, and other hardy plants.

Messrs. WM. WELLS & Co., Merstham, showed *Pentstemons* and *Phloxes*.

Messrs. A. A. WALTERS & SON, Bath, had a charming lot of Delphiniums, notably King of Delphiniums and Rev. E. Lascelles.

Messrs. W. & J. BROWN, Peterborough, had a lovely example of *Ostrowskia magnifica* in the midst of a large number of hardy subjects.

Messrs. JACKMAN & SONS, Woking, displayed rich masses of *Astilbes*, *Liliums*, *Gaillardias*, *Iris Kämpferi*, and *Larkspurs*.

Messrs. G. GIBSON & Co., Leeming Bar, had a showy and extensive exhibit of hardy flowers, chiefly as cut blooms.

deep-green colour, with a narrow line of white drawn parallel with the margin, about one-quarter of an inch from it, and the lamina being paler within this line. Introduced through the Berlin Botanic Garden, and shown by Messrs. JAS. VEITCH & SONS, Chelsea.

Gladiolus nanus "Queen Mary."—This pretty variety belongs to the early-flowering section. The flowers are pale salmon, blotched on the lower petals with cream. Shown by Messrs. BARR & SONS for Messrs. SMITH, Caledonia Nursery, Guernsey.

Pelargonium Lord Bute.—A seedling *Pelargonium* that attracted attention on account of its deep colouring. It is rather a reversion from the newer "fancies" to the older "decoratives," with smaller flowers than the former and the good constitution of the latter. The colour of the petals is a deep maroon, with a narrow edge

Sweet Pea Lady Knox.—A distinct and pleasing variety that Messrs. DOBBIE & Co. have shown consistently well lately. The ground colour is cream, edged lightly with buff, which, with age, flushes into the centre. Several of the sprays had four flowers on each. Shown by Messrs. DOBBIE & Co., Edinburgh.

ORCHID COMMITTEE.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, H. J. Chapman, J. E. Shill, H. Ballantine, W. Thompson, A. Dye, H. G. Alexander, F. Sander, A. Dye, Gurney Wilson, J. Charlesworth, F. M. Ogilvie, W. H. White, R. Brooman-White, W. P. Bound, W. H. Hatcher, Stuart Low, A. A. McBean, R. G. Thwaites, C. J. Lucas, W. Bolton, H. Little, W. Cobb, G. W. Moore, and E. Ashworth.

The display of Orchids was not quite so prominent as the displays which have been seen at the Temple and at Holland Park. Nevertheless, there was a good show at the end of the central walk, very fine groups being staged by Sir JEREMIAH COLMAN, Bart., Messrs. CHARLESWORTH & Co., Messrs. MANSELL & HATCHER, Messrs. STUART LOW, Mr. E. V. Low, and Messrs. SANDER & SONS.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), staged a most interesting group, in which were the curious and beautiful Cata-

group, the elevated centre and two raised groups at the end being composed of Phalenopsis Rimestadiana, about two dozen plants being used in each set. The sides were of finely-flowered Lælio-Cattleyas, Odontoglossums, brilliant scarlet Disa grandiflora, yellow Oncidium macranthum, O. crispum, &c. Some of the finest noted were Cattleya Warscewiczii majestica, the white C. Mossiæ Wageneri, C. M. Silver Queen, C. M. Reineckiana; several dark-coloured Anguloa Ruckeri, and a distinct C. Mendelii, white with a mauve front to the lip. The large, white

and other kinds. The Odontoglossums were specially fine, among them being the rare white O. Uro-Skinneri alba, O. Clytie, O. amabile, and O. Queen Alexandra. Among white Cattleyas were good C. Gaskelliana alba, C. Mossiæ Wageneri, and several other good forms, for one of which—C. Mossiæ Queen Mary—see Awards. Of rare species noted were Coryanthes maculata, Cycnoches, Bifrenaria inodora, Bulbophyllum biflorum, a good pot of Anæctochilus setaceus, Luisia Amesiana, and Dendrobium Sanderianum. Among hybrids were some very dark forms of Lælio-Cattleya Martinetii.

Messrs. STUART LOW & Co., Bush Hill Park, staged a very effective group, in the centre of which were a large number of good specimens of Renanthera Imshootiana fronted by elegant plants of the white Utricularia montana. Cattleya Warscewiczii, C. Mendelii, C. Mossiæ, and white varieties were well displayed, and at the back, yellow Oncidiums, purple Odontoglossum Clytie, a patch of the yellow and red Lælia cinnabrosa, whilst in front was an interesting arrangement of Masdevallias, with Ornithocephalus grandiflorus, the blue Dendrobium Victoria Regina, and other Dendrobiums, Octomerias, Pleurothallis, Stanhopea tigrina, S. devoniensis, and a very fine and probably new white species of Aërides.

Messrs. SANDER & SONS, St. Albans, staged a selection of novelties, one of which secured a First-class Certificate, and three others Awards of Merit (see Awards). Other good things noted were Odontioda Zephyr var. Brilliant, of a bright scarlet colour; O. ornata Princess Mary, a pretty white flower, spotted with red, and some showy Odontoglossums. We also observed a grand example of Cattleya Warscewiczii Sanderiana, with seven flowers on a spike.

H. S. GOODSON, Esq., Fairlawn, Putney, showed the pure white Cattleya Mossiæ Wageneri Goodson's variety, and two plants of the very remarkable Cattleya Mossiæ Mrs. A. Goodson, with fine flowers, variegated rose and blush-white.

Mr. HARRY DIXON, Spencer Park Nurseries, Wandsworth Common, staged an effective group of Cattleya Mossiæ, C. Mendelii, good Odontoglossums, and Odontiodas, Lycaste Deppei, Cœlogyne pandurata, and others.

Mr. E. V. Low, Vale Bridge, Haywards Heath, had a select group, which included the rare white and fragrant Cattleya Eldorado alba, C. Mossiæ Wageneri, with four flowers, Bulbophyllum barbigerum, with three spikes, Lælio-Cattleya × Clive, and other Lælio-Cattleyas, Odontoglossums, Cœlogyne pandurata, Cattleya Lord Rothschild, and the very large-flowered C. Mossiæ Imperator.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed a very fine form of Lælio-Cattleya Rubens (L. pumila praestans × C. Hardyana), with broad, rose-coloured sepals and petals, and intense, velvety-crimson front to the lip.

SAMUEL LARKIN, Esq., The Ridgways, Haslemere (gr. Mr. Hales), showed Lælio-Cattleya Norba Larkin's variety, the canary-yellow flowers showing rose markings on the lip.

W. WATERS BUTLER, Esq., Southfield, Edgbaston (gr. Mr. Jones), showed Lælio-Cattleya Martinetii Southfield variety, a pretty, light form, much resembling Lælia tenebrosa Walton Grange variety.

Mr. G. W. WATERS, Balcombe, staged a selection of Cattleyas and Odontoglossums.

AWARDS.

FIRST-CLASS CERTIFICATES.

Lælio-Cattleya Sylvia (Ascania × Hippolyta Phæbe), from Messrs. CHARLESWORTH & Co.—A most charming and well-formed flower, of a clear, chrome-yellow, tinged with red, the front of the lip being ruby-crimson, with a margin of pale yellow.

Odontoglossum ardentissimum Queen Mary, from Messrs. SANDER & SONS, St. Albans.—Flowers of large size, clear white, heavily blotched with violet colour, the clear white margin being very characteristic.

AWARDS OF MERIT.

Odontoglossum eximium King George, from Messrs. SANDER & SONS.—A fine hybrid, of a deep claret-red colour, with narrow, white margins to the sepals and petals, and white front to the lip.

OLYMPIA SHOW.

FIG. 13.—LÆLIO-CATTELEYA SYLVIA: AWARDED A FIRST-CLASS CERTIFICATE.

setum Colmaniae, a fine yellow flower with a trilobed lip stained with deep crimson; Bulbophyllum virescens, B. Ericssonii, Masdevallia Gargantua and other singular Masdevallias; Waluwa pulchella, Cattleya Harrisoniana alba and other Cattleyas, Odontoglossums, Miltonia vexillaria Queen Alexandra, Odontioda Bradshawia, and other hybrids.

Messrs. CHARLESWORTH & Co., Haywards Heath, had a very extensive and well-arranged

Miltonia vexillaria Queen Alexandra bore four fine spikes. Odontoglossum percultum King George V. had white flowers heavily blotched with violet; Angræcum Eichlerianum, Oncidium Lanceanum, Odontoglossum Williamsianum, and other showy things were also well displayed.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., had a splendid group, most tastefully arranged, the white Phalenopsis arching over the showy-coloured Lælio-Cattleyas, Cattleyas,

Odontoglossum amabile The Queen, from Messrs. SANDER & SONS.—A very large, white, wax-like flower, with an effective ray of rose-purple markings on the middles of the segments.

Odontioda Bradshawiae Sander's variety, from Messrs. SANDER & SONS.—In some degree resembling *O. Coronation*, the inner parts of the segments being orange-scarlet, with a bluish-white margin tinged with rose.

Cattleya Mossiae alba var. *Queen Mary*, from Messrs. MANSELL & HATCHER, Rawdon, Leeds.—One of the most beautiful of white *Cattleyas*. Flowers pure white, with a chrome-yellow disc, and some clear pink markings on the lip.

Lalio-Cattleya Martinetii var. *King George V.*, from Messrs. CHARLESWORTH & Co.—A very beautiful hybrid, with showy, bright-rose flowers and deep claret-coloured lip.

Odontoglossum Olympia.—A large and showy hybrid, of unknown parentage, in beauty exceeding most of the best blotched forms of *Odontoglossum crispum*. Flowers white, heavily barred and blotched with red-brown. From Messrs. CHARLESWORTH & Co.

Cattleya Dupreana (*Warscewiczii* × *Warneri*), from Messrs. CHARLESWORTH & Co.—In form closely approaching *C. Warneri*, coloured bright rose, with crimson front to the lip. A very desirable hybrid.

CULTURAL COMMENDATION.

To Mr. J. Davis, gardener to J. GURNEY FOWLER, Esq., for a noble plant of *Oncidium macranthum* with over 300 flowers.

To Mr. J. Davis, gardener to J. GURNEY FOWLER, Esq., for *Anguloa Cliftonii* with six large yellow and purple flowers.

FRUIT AND VEGETABLE COMMITTEE.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. J. Basham, T. Coomber, H. S. Rivers, J. Jaques, P. C. M. Veitch, H. Hooper, Fred. G. Treseder, A. R. Allan, W. Pope, A. W. Metcalfe, P. D. Tuckett, W. Humphrey, J. Gibson, G. Wythes, G. Kelf, and A. Dean.

FRUIT.

The chief exhibit of fruit trees in pots was a group of Peaches, Cherries, Plums, Pears, Grapes and Oranges, staged by Messrs. T. RIVERS & SONS, Sawbridgeworth, in the annexe. The Peaches included the varieties Thos. Rivers, Sea Eagle and Albatross. Of Cherries, there were May Duke, Governor Wood, Knight's Black, Black Hawk, and Ohio Beauty. Pears were represented by Conference and Pitmaston Duchess; Apples by Lady Sudeley, James Grieve, Mr. Gladstone, and Peasgood's Nonesuch; Plums by Blue Rock and Late Orange. The collection also included vines in bearing, numerous Oranges, including the Egg, St. Michael's and Malta varieties and Figs in variety. There were boxes of gathered fruits of Peaches, Albatross, Thomas Rivers and Gladstone.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, exhibited an arch trained with white and black Grapes. Black Currants and Figs, inclusive of Bourjassotte Grise, White Marseilles, White Turkey and St. John, were also shown by this firm.

H. S. HEILBUT, Esq., Holyport, Maidenhead (gr. Mr. G. Camp), exhibited a group of fruit trees in pots with a few good ripe Charlotte Rothschild and Queen Pines. The trees included Nectarines Lord Napier, Early Rivers and Stanwick Elruge; Cherries Emperor Francis, Bigarreau Napoleon, and Black Bigarreau; and Plums Early Rivers and Greengage.

The KING'S ACRE NURSERIES, Hereford, displayed a group of trees, very crowded on the stage, and scarcely equal to the usual standard of this firm's exhibits, very few of the fruits being mature. The best were Denniston's Superb Plum; red Astrachan Apple; and Triomphe de Vienne Pear. The exhibit included a few trees of Figs, Peaches and Nectarines.

The chief collection of ripe fruits was shown by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), who set up a superb collection of 44 dishes in a most attractive way. There were Black Hamburgh, Madresfield Court, Buckland Sweetwater and Foster's Seedling Grapes; Peaches Hale's Early, Dymond

and Bellegarde; Nectarines Cardinal, Early Rivers, Lord Napier and Elruge; Cherries Early Rivers, Monstrueuse de Mezel, Bigarreau Jaboulay, and Emperor Francis; Figs Brown Turkey, Brunswick, and Bourjassotte Grise; Plums Jefferson; Strawberries Laxton's Latest, Givon's Late Prolific and Waterloo; Apples, James Grieve and Lady Sudeley, and some 20 Melons of diverse varieties, the whole being prettily decorated with small plants and foliage.

The Misses LE LACHEUR & SHERRES, Henfield, Sussex, had a group of their fine, round golden Melon Marchioness of Tweeddale.

The SWANLEY HORTICULTURAL COLLEGE also exhibited a collection of excellent Melons. Also Peaches Noblesse, Gladstone and Dymond; Nectarine Cardinal, and Currants and Raspberries.

LOCKSHEATH NURSERIES, Southampton, put up a collection of 40 dishes of fruit, in which Apples predominated, but many of the varieties were difficult to recognise. Cellini, Gascoyne's Scarlet Seedling, Emperor Alexander, Red Astrachan and Lady Sudeley were the most prominent. Pears included Souvenir du Congrès and Louise Bonne of Jersey; Peaches Hale's Early and Waterloo, and there were also many large Canteloupe Melons.

The NEW ZEALAND GOVERNMENT displayed a collection of 24 dishes of beautiful Apples in but few varieties, including Sturmer Pippin, Monroe Favourite, Cleopatra, Shepperd's Perfection and Jonathan.

Messrs. ED. WEBB & SONS, Wordsley, displayed several fine Melons in their miscellaneous group.

Messrs. LAXTON BROS., Bedford, set up 20 varieties of Strawberries, amongst the finest being Utility, Countess, The Bedford, Latest, Reward and Waterloo. For a background, freely-fruited canes of Raspberries and branches of Red Currants were employed.

A collection of 50 fine Melons was shown by C. F. RAPHAEL, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb). There were specially fine and well-ripened fruits of Emerald Gem, Frogmore Scarlet, Countess, Hero of Lockinge, Al, Rochfords, and Royal Jubilee.

Messrs. WHITELEGG & PAGE, Chislehurst, showed fruits and clusters of Bramble named the Newberry, raised from the Loganberry crossed with a Raspberry. The growing plant is to be inspected by a member of the Committee.

VEGETABLES.

Mr. F. RAPHAEL, through his able gardener, Mr. A. Grubb, staged the chief collection of vegetables sent from a private garden. There were at the back pyramids of Walcheren, Mont Blanc and Eclipse Cauliflowers; Cabbages in variety; Alderman, Quite Content, Duke of Albany, and Stourbridge Marrowfat Peas; Tomatos, Carrots, Beans, Cucumbers, Beets, Turnips, Kohl Rabi, Salads, Marrows and Mushrooms.

H. S. BARTON, Esq., Hewshott House, Liphook, Hampshire (gr. Mr. F. Streeter), staged a collection of some 100 dishes of vegetables for the first time at a London show, but the quality was much below what is generally seen at these exhibitions.

Messrs. SUTTON & SONS, Reading, filled a long table with a grand collection of some 80 dishes of vegetables, and, in addition, a large collection of Peas. Of the mixed collection, specially good were Cauliflowers Magnum Bonum and White Queen; Early Giant Peas; White and Pink Celeries; Favourite Cabbages; Satisfaction, Perfection, Winter Beauty, Best of All and other Tomatos; Peerless, Matchless and Delicacy Cucumbers; Beans, Cabbage Lettuces, numerous Marrows, Globe Artichokes, Asparagus, Radishes, Beets and Turnips. The special collection of Peas included fine pods of Prizewinner, Magnum Bonum, Dwarf Defiance, Exhibition Marrowfat, and Centenary, as well as some promising seedlings.

Messrs. ED. WEBB & SONS, Wordsley, showed a capital selection of vegetables in their miscellaneous exhibit, including Defiance, Marrowfat, King George and Stourbridge Marrow Peas; Universal, Everbearing and Royal Favourite Cucumbers; Peerless and Early Mammoth Cauliflowers; Tomatos, Potatos, Asparagus, Long Pod Beans, Kidney Beans, Beets, and various other excellent kitchen-garden produce.

Mr. S. MORTIMER, Rowledge, Farnham, Surrey, showed very handsome fruits of his new Cucumbers Unrivalled and Cynosure.

AWARD.

AWARD OF MERIT.

Strawberry Olympia.—Raised from Givon's Late Prolific and St. Antoine de Padoue. The fruits are large, rounded, bright red, and of good flavour and substance. The variety is a heavy cropper and late in ripening. (Shown by Mr. PETERS, Givon's Grove, Leatherhead.)

For Awards made by the Council see p. viii.

LUNCHEON TO COLONIAL VISITORS.

ON Wednesday a complimentary luncheon was offered to the Premiers, Governors, and other officials of the British Colonial Empire visiting London for the Coronation. Sir Trevor Lawrence, President of the Society, presided. Amongst the speakers were Sir Daniel Morris, who proposed the toast of "The Guests," Sir Albert Gould, C.M.G., President of the Federal Senate of the Commonwealth Parliament of Australia, Sir Thomas Elliott, K.C.B., Secretary to the Board of Agriculture and Fisheries, Sir Albert Rollit, D.C., LL.D., and the Hon. J. H. Turner, Agent-General for British Columbia.

We print below an official list of those who accepted invitations to be present:—

Aitken, Mr. Thos.
Alleyne, Mr. Forster.
Aspinall, Algernon E., Secretary, West India Committee.
Baines, Jos.
Bamber, Mr. M. Kelway, Ceylon.
Barth, Mr. Justice, British East Africa.
Belcher, Lt.-Col. R., C.M.G., Edmonton, Canada.
Bertin, Mr. Henry, Mauritius.
Bilney, W. A., J.P.
Boose, J. R., Secretary, Royal Colonial Institute.
Boscawen, Hon. John de Clare.
Boulger, Prof. G. S., F.L.S.
Bowles, E. A., M.A.
Boyle, Sir Cavendish, K.C.M.G., Governor of Mauritius.
Bradley, J. W., A.M.I.C.E., City Engineer, Westminster.
Bridges, Rear-Adm. W., Victoria.
Bunyard, G.O., V.M.H.
Campbell, Hon. Colin H., K.C., Attorney-General of Manitoba.
Carmody, Prof., Director of Agriculture, Trinidad.
Carter, Sir Gilbert, K.C.M.G., Late Governor of Barbados.
Chiappini, C. du P., Trades Commissioner in London for S. Africa.
Child, Walter.
Chittenden, F. J.
Chomley, His Honour Judge, Victoria.
Clark, W. T. L.
Clarke, His Honour Sir F., Chief Justice of Jamaica.
Colman, Sir Jeremiah, Bart.
Crewe, D., J.P., New Zealand.
Crossman, Charles R., Secretary of the Sydney Hort. Soc.
Davidson, Walter E., Governor of Seychelles Islands.
Davidson-Doustone, Lt.-Col., C.M.G., Commissioner of Montserrat.
Daoust, E., Director New Olympia Co.
Dorrien-Smith, Capt. A. A.
Duncan, the Hon. J. J., Member of the Legislative Council of S. Australia.
Earp, The Hon. George, Member of the Legislative Council of New South Wales.
Ebblewhite, E. A., Clerk of the Gardeners' Co.
Elliott, Sir Thos. H., K.C.B., Secretary to the Board of Agriculture and Fisheries.
Euren, F.
Evans, Maurice S., C.M.G., Natal.
Finch, A. R., A.M.I.C.E., Boro' Engineer of Kensington.
Fowler, Gurney, Treasurer, Royal Hort. Soc.
Gaskell, Arthur J.
George, Joseph W. C.
Godfrey, George, Victoria.
Gomme, Sir Lawrence, London County Council.
Gould, Sir Albert J., V.D., President of the Federal Senate of the Commonwealth Parliament of Australia.
Griffith, W. L., Secretary for the Dominion of Canada.
Grindle, G. E. A., Chief of the West Indies Dept., Colonial Office.
Gueritz, E. P., Governor of British North Borneo.
Hall-Jones, Hon. Sir W., High Commissioner for New Zealand.
Hewlett, J. C., Renter Warden of the Fruiterers' Co.
Howard, J., Agent-General for Nova Scotia.
Holford, Lt.-Col. Sir Geo.
Hudson, J., Member of Council, Royal Hort. Soc.
Hulett, Senator the Hon. Sir James Liege, Union of South Africa.
Hunt, Atlee, C.M.G., Secretary for External Affairs, Commonwealth of Australia.
Hyndman-Jones, Sir Wm. H., Chief Justice of the Straits Settlements.
Kidd, Alfred, New Zealand.
King, Col. Wallis, M.V.O., of the Naval and Military Tournament.
Kirkpatrick, The Hon. A. A., Agent-General for S. Australia.
Lawrence, Sir Trevor, Bart., K.C.V.O.
Leete, William Chambers, Town Clerk of the Boro' of Kensington.

Llewellyn, Sir John, Bart., Vice-President of the Royal Hort. Soc.
 Lucas, Sir Charles, K.C.M.G., Secretary for the Dominions at the Colonial Office.
 McCarthy, R. H., late Govt. Director, Trinidad Dock Co.
 Marshall, W., V.M.H.
 May, H. B., V.M.H.
 Michell, The Hon. Sir Lewis, Cape Town.
 Mills, Sir James, K.C.M.G., New Zealand.
 Moore, The Hon. Sir Newton, Agent-General for Western Australia.
 Morris, Sir Daniel, K.C.M.G.
 Neitenstein, Capt. F. W., New South Wales.
 Payne, F. H.
 Pearson, R. Hooper.
 Perth, The Rt. Rev. the Bishop of, Western Australia.
 Prain, Lt.-Col. W. D., F.R.S., Director of the Royal Gardens, Kew.
 Rayner, Sir Thos. Crossley, Attorney-General, British Guiana.
 Reader, Frank
 Rendle, Dr. A. B., Natural History Museum.
 Robinson, Major Sir Thomas B., Agent-General for Queensland.
 Rolit, Sir Albert, D.L.
 Russell, Sir William, New Zealand.
 Rutherford, R., Vice-Chairman of the West India Committee.
 Senn, C. Herman, Hon. Sec., Cookery and Food Assoc.
 Sherwood, N. N.
 Shoobridge, R. W. C., Tasmania.
 Stockdale, F. A., B.A., F.L.S., West Indies.
 Symon, Sir Josiah, Senator, South Australia.
 Turner, The Hon. J. H., Agent-General for British Columbia.
 Twining, Rev. W. H. G., St. Stephens, Westminster.
 Veitch, H. J., V.M.H.
 Wardill, Major B. J., Victoria.
 Wickham, H. A., Papua.
 Wilkinson, Capt. H. F.
 Wilks, The Rev. W., Secretary, Royal Hort. Soc.
 Wilmot, The Hon. A., K.S.G., Member of the Legislative Council, Cape Colony.
 Wittenom, Hon. Sir Edward, of Western Australia.
 Wright, S. T.
 Young, The Hon. Sir James, Member of the Executive Council, Bahamas.

FESTIVAL OF EMPIRE ROSE SHOW.

JUNE 29.—The Rose Show organised by the horticultural department of the Festival of Empire was held on the above date at the Crystal Palace under the management of Mr. T. Geoffrey W. Henslow. The schedule in the main followed that of the National Rose Society, whose rules for judging were also adopted, but a great predominance was given to exhibition Roses on boards, which formed, perhaps, the chief feature of the show, only two classes being arranged for nurserymen's collections of decorative Roses and none for representative groups. No money prizes were awarded, silver cups or gold medals in each case constituting the 1st, with silver and bronze medals for 2nd and 3rd prizes. Cups were presented by the National Rose Society, *The Daily Telegraph*, The Festival of Empire, Duke of Fife, Earl of Plymouth, Lord Northcote, Col. Hutchison, Sir Joseph Lyons, &c.

On the whole the classes were well contested. Five nurserymen showed in the class for 48 blooms and 10 in that for 36 blooms. The entries were still more satisfactory in the classes for the small amateurs (growing fewer than 500 plants), in some of which as many as 20 exhibits were staged. The quality of the blooms was a good average—the season had scarcely promised better—with a few blooms of exceptionally fine colour. The Gold Medal offered for the best Rose in the show was awarded to a bloom of Frau Karl Druschki in Messrs. D. PRIOR & SONS', Colchester, exhibit. The 1st and 2nd prizes in the class for 12 Hybrid Perpetuals were awarded to the variety Mrs. John Laing. Mrs. T. Roosevelt, Lyon Rose and White Killarney (all of them new Roses) were the winning Hybrid Teas. White Maman Cochet and Maman Cochet were 1st and 2nd respectively in the class for Teas or Noisettes. Lyon Rose was remarkable in taking a place on almost every board in every class for which it was eligible. The Silver Cup offered for the best 12 blooms of any new Rose was won by Messrs. HUGH DICKSON & SONS, Belfast, with the variety Leslie Holland. Messrs. B. R. CANT & SONS, Colchester, were awarded the Gold Medal offered for 12 new Roses not offered for sale before 1908, with the varieties Claudius, Comtesse I. Hardegg, Dr. O'D. Browne, Elizabeth, Ethel Malcolm, John Cuff, J. L. Mock, La Galisère, Lyon Rose, Molly S. Crawford, Rhea Reid and White Killarney. Lady Hillingdon and Lady Pirrie were also well shown in this class.

The winning seedling Roses were all Irish-raised. The prizes were awarded as follow:—(H.T.) 1st, Queen Mary, a very bright pink Rose with base of yellow and orange, the colours of

Juliet with the light substance and freedom of the Hybrid Tea Rose; 2nd, King George V., a rich crimson variety of fine form and scent; 3rd, The Hon. Mrs. George Lawson Johnston, small, buff-orange flowers of fine form: a neat and pretty Rose; 4th, Firebrand, a large orange-coloured single Rose with beautiful buds. Messrs. A. DICKSON & SONS, Newtownards, were the winners of the 1st and 4th and Messrs. H. DICKSON, Belfast, of the 2nd and 3rd prizes.

The Gold Medal in the amateurs' class, offered for the six sweetest-scented Roses, was awarded to the Rev. J. H. PEMBERTON, Havering-atte-Bower, for Mme. A. Carrière, Moschatà, René André, Seagull, York and Lancaster and Zéphyrine Drouhin.

* * * Owing to unusual pressure on our space, reports of several exhibitions are held over until next week.

A GARDENER'S NOTICE: *Ashwells*. It is customary for an under-gardener to give and receive a week's notice to terminate an engagement. In the case of a head gardener a month's notice is usual.

COCOS WEDDELIANA: *W.B.* We have examined the plants, and find no trace of disease. We are unable to explain the cause of their failure as we have no knowledge of the treatment they have received.

"CORONATION" FLOWER-BED: *T. W.* The plants you name are not the best for the purpose. Use the Echeverias for an edging, raised 6 inches above the ground level, and planting them in double or triple rows. Next to the Echeverias plant a 3 to 4-inch line of Pyrethrum and a groundwork of the Saxifrage. You might form a crown in the centre worked out in Pyrethrum and Antennaria. An Old English "G" might be formed at the right-side end, and "M" at the left-side end, in Ajuga, with the narrowest possible edge of Pyrethrum. On the right side, between the monogram and crown, a single heraldic rose in Antennaria; on the corresponding left side, a Thistle, in Antennaria and Ajuga, with a few circles composed of Antennaria, and a Shamrock in green worked in each. If space permits, a neat scroll of Pyrethrum might be worked in on each side.

FLOWERS FOR PLANTING IN BOWLS: *Bazaar*. Those you name are suitable, but we mention a few others. Lily of the Valley from retarded crowns, started five or six weeks before they are required to flower; Lobelia Katherine Mallard, Marguerites Queen Alexandra and Boule de Neige, Ivy-leaf Pelargoniums Mme. Crousse, Galilee, and Souvenir de C. Turner; double and single Begonias, Carnations Britannia and Mrs. H. Burnett, Campanula isophylla alba, and China Asters. Foliage plants, including Ferns in variety, Begonia Rex, and Aspidistras may also be employed.

HOLLYHOCK DISEASED: *W. A. C.* The Hollyhock is affected with "Hollyhock" rust (*Puccinia malvacearum*), which is very abundant on the specimens. The best method of checking the spread of the disease is to spray the plants with liver of sulphur—1 ounce in 3 gallons of water.

HYDRANGEA LEAVES LOSING THEIR GREEN COLOUR: *H. H.* Water the foliage of the Hydrangeas with a one per cent. solution of sulphate of iron at intervals of three days.

NAMES OF PLANTS: *G. W. H.* *Phlomis fruticosa*.—*W. & S.* *Dianthus chinensis* var.—*H. MacDonald*. *Festuca ovina*.—*J. Mason*. *Diplotaxis muralis*, *Salvia verticillata* (Broad-leaf), *S. nemorosa*.—*O. N.* *Cornus capitata*.—*W. J. C.* *Iris xiphoides* (English Iris).—*W. E. Th.* *Cotyledon chrysanthus*, a native of Asia Minor.

ROSE COMMANDANT FELIX FAURE: *W. R.* No disease is present in the plants; the brown spots on the leaves are caused by unfavourable weather.

ROSE LEAVES: *W. A. G.* The injury to the Rose leaves is caused by the Rose slugworm. Spray the plants with a solution of hellebore. The surface soil should be removed during the winter, burying it deeply in some out-of-the-way part of the garden, and replacing it by fresh mould.

ROSE W. A. RICHARDSON: *W. A. H.* We are unable to account for the failure of your Roses. There is no disease present in the specimens, therefore some wrong cultural treatment or unsuitable soil may be responsible.

RUST ON BEGONIAS: *Tuberous*. We cannot determine what is causing the rust on your Begonias, unless you submit examples of the affected leaves for examination, but the injury is most frequently caused by mites, and these pests may be destroyed by dipping the plants in Tobacco water.

SOLANUM: *F. W.* Solanum appears to be first mentioned by Pliny, who thought it to be the same as the Greek Strychnos. The word is connected with the Latin verb *solor*, to "comfort," hence our word "solace," from *solatio*, also of inanimate things to "relieve" or assuage." This may suggest (but Pliny offers no hint, for he gives quite other uses) the origin of the word; as the Mandrake, of the same family, was used as an anæsthetic for surgical operations by the Roman surgeons. Strychnos, he says, had "black berries," so that might have been Solanum nigrum. There does not seem to be any certainty about the etymology of the word.

SOLANUM LEAVES: *W. N.* The scurfiness on the leaves of your plants of Solanum is caused by an excess of moisture in the air. Ventilation should be freely afforded the plants early in the day.

SOUTH AFRICAN PAPER: *K. & L. Boskoop*. *South African Gardening and Agriculture* is published by the Horticultural Publishing Company, Box 3958, Johannesburg, South Africa, price 6d.

STOCKS DISEASED: *F. F.* The plants are affected with mildew. Spray the plants at intervals of three days with a solution of liver of sulphur, at a strength of 1 ounce in 3 gallons of water.

TOMATOS DISEASED: *A. S. R. & Co.*—See reply to *Old Subscriber* in the issue for June 24, p. 420.

TOMATO FAILURE: *W. H. H.* The Tomato plants have been injured by the fungus causing "sleepy disease." Water them with sulphate of potash, at a strength of 1 ounce in each gallon of water.

TOMATO "MILDEW": *Correspondent*. The Tomatos are affected with Tomato-leaf rust. Spray the plants every third day with a solution of liver of sulphur—1 ounce in 2 gallons of water.

TULIPS DISEASED: *Entre Nous*. From your description, we assume that the Tulips are affected with Botrytis. Before the bulbs are stored, they should be dusted over with flowers of sulphur. Vaporite may be employed in the soil with good results.

WOODLOUSE: *A. W.* This pest is usually more abundant in the warmer glasshouses. Set traps for them by hollowing out pieces of Potato, Turnip, or other vegetable, and place the pieces, hollow side downwards, in the haunts of the pest. On examining the baits each morning, they will usually be found to contain woodlice, which should be destroyed, and the traps replaced. Another method is to poison the baits by soaking them in Paris Green or white arsenic. Steiner's "Vermin Paste" may also be recommended. The paste is mixed with Barley meal or middlings, putting it on pieces of glass, wood, or tin, then placing in the haunts of the woodlice.

INJURIOUS INSECTS AND PLANT DISEASES.

LEGISLATION IN CANADA.

THE Department of Agriculture of Canada is empowered by the Destructive Insect and Pest Act of 1910 to take such action as may be deemed necessary to prevent the introduction or spreading of injurious insects, pests, and plant diseases. All plants, with the exception of certain classes, such as greenhouse-grown plants, herbaceous perennials, and bulbs may be imported at certain seasons of the year only and through certain ports as specified in the Regulations. The Department of Agriculture has power to inspect plants liable to be infested with certain insects and plant diseases, to destroy the same if necessary or to prohibit their importation into Canada.

At six of the ports of entry (see Section 3 of the Regulations) fumigation stations are established where plants from countries and states infested or liable to be infested with the San Jose Scale are fumigated with hydrocyanic acid gas by special officers in charge.

Plants from Europe, Japan and the States of Vermont, Maine, Massachusetts, New Hampshire, Connecticut, and Rhode Island, six of the United States of America, are inspected by officers of the Department for the Brown-tail moth and Gipsy moth. In some cases this inspection is made at the port of entry, in other cases at the destination of the stock. In the latter case the plants may not be unpacked except in the presence of an inspector.

It is necessary for all persons and transportation companies importing or bringing plants into Canada to notify the Dominion Entomologist, Ottawa, of the fact, and, through the co-operation of the Department of Customs, the Customs officers at the ports of entry also send advices of the arrival of shipments of plants at the various ports through which plants may enter.

In addition to the inspection and fumigation of imported plants, field officers are employed in inspecting orchards and in carrying out eradication measures against the Brown-tail moth in those regions in Nova Scotia and New Brunswick infested with the insect. This eradication work is carried out in co-operation with the respective provincial governments. The fumigation and inspection of imported plants and infested regions and all measures for eradication work are carried out under the direction of the Dominion Entomologist.

The Minister of Agriculture has power to prohibit the importation of plants from any given region should it be deemed necessary, owing to the presence of serious insect pests or diseases in such a region. This has been done in the case of Potatoes from Newfoundland and the neighbouring islands, to prevent the introduction of Potato canker (*Chrysophlyctis endobiotica*).

The Destructive Insect and Pest Act, and the Regulations issued under the Act are given below.

In addition to the legislation of the Federal Government, certain of the provincial governments have instituted legislative measures in reference to plant diseases and pests.

The province of British Columbia inspects all plants and fruits entering the province, and any plant or fruit found to be infested with insect pests is either subjected to treatment or destroyed.

The province of Ontario has legislation chiefly relating to the inspection of nurseries and nursery plants.

The province of Nova Scotia has recently enacted legislation under which the Department of Agriculture for the province will have power to inspect orchards and take such steps as are necessary for the eradication or control of the more serious insect pests and plant diseases.

THE DESTRUCTIVE INSECT AND PEST ACT.

An Act to prevent the introduction or spreading of insects, pests and diseases destructive to vegetation.

(9-10 Edward VII., Chap. 31.)

His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follow:

1. This Act may be cited as the Destructive Insect and Pest Act.

2. In this Act, unless the context otherwise requires, "the Minister" means "the Minister of Agriculture."

3. The Governor in Council may make such regulations as are deemed expedient to prevent the introduction or admission into Canada, or the spreading therein, of

any insect, pest, or disease destructive to vegetation.

4. Such regulations may provide:—

(a) for the prohibition generally, or from any particular country or place, of the introduction or admission into Canada of any vegetable or other matter likely to introduce any such insect, pest, or disease;

(b) the terms or conditions upon, and the places at which any such vegetable or other matter may be introduced or admitted into Canada;

(c) for the treatment and manner of treatment to be given to any vegetation, vegetable matter or premises in order to prevent the spreading of any such insect, pest or disease, and may prescribe whether such treatment shall be given by the owner or by a person appointed for such purpose;

(d) for the destruction of any crop, tree, bush or other vegetation or vegetable matter or containers thereof infested or suspected to be infested with any such insect, pest or disease;

(e) for the granting of compensation for any such crop, tree, bush or other vegetation or containers thereof so destroyed, such compensation not to exceed two-thirds of the value of the matter destroyed and to be granted only by the Governor in Council upon the recommendation of the Minister;

(f) for the prohibition of the sale of any vegetable matter infected with any such insect, pest or disease;

(g) that the occupier of the premises on which is discovered any such insect, pest or disease shall forthwith notify the Minister and shall also send specimens of such insect, pest or disease;

(h) for the confiscation of any vegetable matter and the container thereof, if any, in respect of which a breach of this Act, or any regulation made thereunder is committed and generally for any other purpose which may be deemed expedient for carrying out this Act, whether such other regulations are of the kind enumerated in this section or not.

5. The Minister may appoint inspectors and other officers for carrying out this Act and the Regulations made thereunder. Such appointments, if not confirmed by the Governor in Council within 30 days of the date thereof, shall lapse and cease to be valid.

6. Any inspector or other officer so appointed may enter any place or premises in which he has reason to believe there exists any such insect, pest or disease, and may take specimens thereof and also of any vegetable matter infested or suspected of being infested therewith.

7. The Minister, upon the report of any inspector setting forth a reasonable belief of the existence of any such insect, pest or disease in any area defined in such report, may prohibit the removal from such area or the movement therein of any vegetation, vegetable or other matter which, in his opinion, is likely to result in the spread of such insect, pest or disease.

8. Every person who contravenes any provision of this Act, or any regulation made thereunder, shall be liable, upon summary conviction, to a fine not exceeding 100 dollars, or to imprisonment for a term not exceeding six months, or to both fine and imprisonment. Any vegetable or other matter imported or brought into Canada contrary to this Act, or to any regulation made thereunder, shall be forfeited to the Crown.

NEW OR NOTEWORTHY PLANTS.

MECONOPSIS INTEGRIFOLIA \times M. GRANDIS.

THIS new hybrid (see fig. 14) has flowered in Mr. Beamish's garden at Ashbourne, Glounthaune, Co. Cork.

FIG 14.—HYBRID MECONOPSIS FROM A CROSS BETWEEN M. INTEGRIFOLIA AND M. GRANDIS.

9. Every order in council and regulation made under this Act shall be published in *The Canada Gazette*, and shall be laid, by the Minister, before Parliament within 15 days after the commencement of the then next session.

10. The San Jose Scale Act is repealed. C. Gordon Hewitt, D.Sc., Dominion Entomologist, Ottawa.

(To be continued.)

In habit the plant resembles *M. integrifolia*, but it is as vigorous as *M. grandis*. The flowers show certain characteristics of both parents. The leaf is more after *M. integrifolia*, but is somewhat shorter and broader, and is covered with a buff tomentum, such as is seen on *M. Wallichii*.

The flowers are of a metallic-like, citron yellow, showing a reflection of the purple which backs the eight petals.

The stamens are arranged densely like those of *Magnolia Watsonii*, and their colour is a most exquisite shade of bronze-yellow. The beauty of the stamens alone will assure a welcome for this hybrid.

I believe that this is the first cross of *M. integrifolia* and *M. grandis* to be recorded, and it is encouraging because it shows the possibility of getting a beautiful hybrid race of *Meconopsis*.

Mr. Beamish tells me that although a cross between a perennial and a biennial, the hybrid has most fortunately assumed the characteristics of the perennial. The vigour of the plant was greater than any other *Meconopsis* seen in cultivation at Ashbourne, although all were satisfactory. W. H. Paine.

ORCHID NOTES AND GLEANINGS.

CATTLEYA MOSSIÆ QUEEN OF SHEBA.

A FLOWER from a spike bearing four flowers of this very handsome variety of *Cattleya Mossiæ* has been sent us by Francis Wellesley, Esq., Westfield, Woking. The variety is one of the best of the white forms of *C. Mossiæ*, the flowers having snow-white sepals and petals, and a broad white front to the lip, which has purple markings, and an orange-coloured disc. It approaches the forms of *C. Mossiæ Reineckiana*, but has less colour in the lip.

CATTLEYA MOSSIÆ DUCHESS OF NORFOLK.

THIS is another choice Orchid flowering for the first time with Francis Wellesley, Esq. (gr. Mr. Hopkins). It has silver-white flowers, of a fine form, slightly tinted with lavender, and orange-coloured disc to the lip, with rose-purple markings at the base. There is a slight freckling of the rose-purple inside the white, crimped margin.

THE STRAWBERRY SEASON.

By far the most sensational incident in the past Strawberry season was the report in the papers of June 6 that baskets containing 24 lbs. of French Strawberries had been sold in the open market at the price of 1s. each, or one half-penny per lb. This almost incredible assertion was confirmed by Mr. George Monro, who explained that the low price was due to the bad condition of the fruit, owing to the exceptionally hot weather; but, even so, the figure was surprising enough, for we may be sure that there was little fault to find with the packing, the French growers being far more particular in that important point than home growers. A few years ago even soft fruit would have realised 1s. per lb. in the first week in June; but conditions in the Strawberry business are ever changing, and the high prices of the past are nothing more than a memory to the once fortunate grower. The cultivation of Strawberries for market has increased by leaps and bounds within the past few years, and the supplies from the Continent, which reach the market earlier, have been growing heavier year by year.

Such unremunerative prices as much of the imported fruit has brought this year must soon have an effect upon the foreign producer, and as the tendency of the British Strawberry is to become earlier every year, it is probable that foreign supplies will begin to show a falling-off before many more seasons have gone by. Anyone who cares to turn up the files of the gardening papers of 30 years ago will find that, in those days, the Strawberry season seldom began before the latter end of June, and is not so many years since there was no great quantity of berries in the English market before the middle of that month. For the past two or three seasons, June 10 has been about the average date for the appearance of the home-grown supplies; but this year has beaten all records by four or

five days. On June 6 this year there were hundreds of pounds of outdoor Strawberries in Covent Garden, and a day or two later fruit of surprisingly good quality was being sold in the streets at the low price of 4d. per lb.

The abnormal amount of bright sunshine has been responsible, to some extent, for the earliness of the Strawberry crop this year; but for some time past those who make a speciality of this fruit have been striving to produce earlier-fruiting varieties, and they have succeeded. This is entirely as it should be, for anything that will lengthen the always too short season of the home-grown Strawberry will find favour with the British public. In time, therefore, it is likely that the foreigner will be ousted from the market, for, so soon as the home-grown supplies appear upon the scene, it no longer pays the foreigner to ship his fruit over here. But, with his more favourable climate, the Continental grower can still be ahead of home growers in the cultivation of the earliest varieties for our markets; here, however, he is faced with another difficulty. There is a limit to the desire of the British public, even

per lb., and it is not so very long since that the Southampton growers used to make it a rule to cease sending supplies to the open market when the returns fell short of 1s. for the gallon basket of about 4 lbs. When that happened, they turned to the jam manufacturer, who was not quite so particular as to the quality, grading, and general condition of the berries, and could, therefore, be supplied more profitably at the lower rate.

If, in the face of increased competition, the grower still hopes to make his business pay, he must give more attention to certain points that did not matter so much a few years ago, when the supply was less equal to the demand than it is to-day. The Kentish growers—or, at least, a great number of them—still persist in marketing their fruit in the antiquated peck basket, which has always been too large for the purpose. The Southampton district made its name for Strawberries very largely through the adoption of the gallon handle-basket by the growers, and it is safe to say that the fruit ought never to be packed in anything larger; nor is there any form of package which prevents

point that is likely to stimulate the demand ought to be overlooked. "Firsts" ought always to be "firsts" right through, and not "seconds" after the top layer has been removed. The fault, no doubt, is often with the pickers, but that is simply a question of adequate supervision.

The statistics for the present year's Strawberry crop are not yet to hand, but it is unlikely that there will be any advance on last year's figures when the totals are made up. The crop has been a good one, but a part of it was spoiled by showery weather. With an abnormal amount of sunshine at the beginning, the fruit seemed unable to withstand the change to less favourable conditions; for although there has been less wet weather this season than last, there has been more loss through damping-off in the latter part of the season. This is a point to which, it seems, the Strawberry-raiser might pay further attention, for some varieties are certainly more addicted to mildew than others.

In his endeavour to cultivate the early varieties, the grower should not lose sight of the great value of the later kinds, for the public will continue to buy them over a long period; in fact, so long as the warm weather lasts, the demand for Strawberries will be sustained. This year the early varieties were quickly gone, and the market could have taken a heavy supply of later sorts after the inevitable glut was over. The north-country grower, whose fruits do not ripen till those from the south are almost past, finds that it pays him to send his fruit southwards, and the southern grower should, therefore, find it equally profitable to cultivate a late crop. F. B.

FIG. 15.—*DRACÆNA DEREMENSIS* WARNECKII: LEAVES GREEN AND WHITE.
SHOWN BY MESSRS. JAS. VEITCH AND SONS.

The plant was given an Award of Merit at the Olympia Show (see p. 17).

with regard to the early Strawberry. Strawberries, as in the case of Cucumbers, are not wanted in any quantity until warm weather arrives. It is seldom that hot weather prevails until the end of May, so that the demand for Strawberries, so far as the multitude is concerned, does not arise till then. Furthermore, the masses appear to be very conservative in the matter of Strawberries. They believe—and they are quite right in their belief—that there is nothing like the home-grown berry. Foreign Strawberries are offered to them at quite reasonable prices, yet they do not want them. If they did, the French fruit, even in a soft condition, would not go a-begging at a halfpenny a pound! At twelve times that figure the French grower would find the business a poor one, for this crop does not pay at so low a price. The nature of the fruit involves too much labour in picking and packing, and too much cost in transit, to enable it to be sold at a cutting price and still leave a profit to the grower. Even the English producer begins to doubt whether it pays him to market his fruit when the price falls below 2d.

damage in transit so effectively. Another equally important point is that of grading the fruit, an operation which many growers still seem to consider superfluous, except so far as the top layer of the basket is concerned. Grading, with this exception, is often left entirely to the retailer, and it is not to be supposed that he will be prepared to give so good a price when this labour devolves upon himself. Moreover, the fruit is damaged by the second unnecessary handling. It seems that the average grower cannot be persuaded that the old habit of "topping-up" is a bad one, and tells against him in the long run; nor does he seem capable of learning that to put a lot of unripe berries underneath is a policy that eventually is damaging to his own interests. Good as the demand for Strawberries invariably is, the average customer would be far more ready to buy if he could always be sure that there was no likelihood of being deceived. Let the Strawberry-grower be more discriminating in these matters, and he will find that such attention has much to do in keeping up the prices of his produce, for no

THE PRIMULAS OF THE EUROPEAN ALPS.

(Continued from vol. xlix., p. 414.)

SUBSECTION 6.—*Cyanopsis*.—Note: Leaves sticky, narrow, fleshy, glossy, serrate; bracts broad and leafy; flowers blue-violet.

This section contains only two plants, both half-paludose and both difficult. Only one is ever likely to occur even to the energetic wanderer in Europe.

P. glutinosa (Wulfen).—A species of remarkable loveliness and charm. The leaves are narrowish, oblong-lanceolate, toothed from the middle upwards, dark, glossy-green, and very sticky with glandular exudations. The scape rises well above the leaves, stiffish and upstanding though they are, to the height of 3 or 4 inches. The bracts are so broad as almost to be baggy in effect; they tend to be of a purplish-brown, and enclose the whole flower-cluster. The flowers themselves are carried on very short, negligible pedicels, and, thus crowded in by the bracts, do not stand out as boldly as they should. They are, however, fairly large, wide-open, with the corolla lobes so deeply cleft as to make the blossoms look as if each consisted of ten segments. They are intensely fragrant, and, in colour, of a no less intense violet-blue, quite startling in the pure splendour of its tone. With the exception of *P. farinosa*, *P. glutinosa* is the only damp-loving species of the Central European Alps.

P. glutinosa ranges from the Western Rhetians through all the Austrian Alps, restricted always to damp, peaty places at great elevations, on the granitic formations only. On smooth, grassy little lawns, just free from snow, beside the Alpine rivulets, high up, the Blauer Speik may most hopefully be looked for (Heiligenblut! Stelvio!) It is a local, perhaps, rather than a really rare plant; but rarity and remarkable beauty combined have given it, in Austrian eyes, a glamour equal to that so ridiculously woven round the flannel-flower in more conventionalised regions. In cultivation *P. glutinosa* is, I fear, certainly difficult; or rather, perhaps, though patient of culture and specially patient of pot-culture, it is very shy of blossom in England. In point of fact, I believe that, like the Soldanellas,

it requires an atmosphere heavy-laden with moisture during the growing period, if it is to develop its flowering force to perfection. It should be treated (as its habit of dying completely down in winter suggests) as a bog-plant, and will be greatly helped—as will *P. farinosa*—if grown among some fine perennial grass, such as *Festuca ovina tenuifolia*.

P. deorum (Velenovsky).—A stout, handsome, rhizomatous species, first described in 1890. Leaves rather stiff and leathery, quite entire, pointed, margined with membrane, set with sessile glands, 3 or 4 inches long, and about half an inch wide. The viscid scape rises to 5 or 8 inches, and carries a unilateral, half-nodding umbel of purple-violet flowers, which are not quite large enough for the size of the plant.

P. deorum loves the same damp lawns near melting snow that are preferred by *P. glutinosa*, but is found only in Bulgaria, on the Rilo Range. In cultivation I fancy that it is capacious; a large number of plants that I once imported died some years since, leaving only the memory of a beauty less brilliant than I had expected, and of a root-stock that had a curious tendency to dive into the earth at right-angles to its previous course. *Reginald Farrer.*

(To be continued.)

TREES AND SHRUBS.

THE CATALPAS.*

THE Western, or, as it is sometimes called, the Hardy Catalpa, *Catalpa speciosa*, is in flower here (Arnold Arboretum, U.S.A., June 20). The true characters of this tree were overlooked by botanists until about 30 years ago when the remarkable durability of its wood first called much attention to it. It is a native of the valley of the Mississippi, where, on the rich, moist, and often inundated bottom-lands of streams, it sometimes attains the height of 100 feet. It differs from the other American species, *Catalpa bignonioides*, which will not be in flower for two or three weeks, by the longer points of the leaves, by the larger flowers only slightly spotted on the inner side of the corolla, and borne in short, open few-flowered clusters, and by the stouter pods. It is a much hardier tree than the more southern species, and has a more erect habit, and it grows more rapidly; indeed, it often grows too rapidly, and then sometimes suffers in cold winters from splits in the trunk. At one time much was expected of this tree, and the agricultural and horticultural journals were filled with descriptions of its many virtues. All the Catalpas have only a thin layer of sapwood, and the whole trunk is therefore almost entirely composed of heartwood; this resists decay for a long time, and there are well authenticated records of Catalpa fence-posts having remained in the ground for half a century without deterioration. For the production of fence-posts, telegraph and other poles, no other tree gives a better yield if it is planted in rich soil. Catalpa wood is very soft, and the claims that this tree would supply the railroads with the best possible ties have not been fulfilled, for the wood is too soft to resist the cutting of the rails. If as a timber tree the Western Catalpa is less valuable than was at one time supposed, it is the handsomest of all the Catalpas which have flowered in the United States, and a fast-growing, desirable, ornamental tree. *Catalpa ovata* (sometimes called *Catalpa Kämpferi*), a native of central and western China, although first brought to this country from Japan where it has been cultivated for more than two centuries, is not yet in flower. This is a small tree, which in July produces in great profusion its small light yellow flowers which are succeeded by slender pods. It is hardier than either of the American species, but very inferior to them as an ornamental tree. A hybrid of this tree and one of the American

species, *Catalpa Teasii*, is a valuable ornamental tree. It appeared several years in the nursery of J. C. Teas in Indiana, and is a perfectly hardy and fast-growing tree, with larger leaves than either of its parents, and enormous flower-clusters containing from 200 to 300 flowers. The corolla is slightly tinged with yellow, and is marked by broad purple stripes. This hybrid will not be in flower until next month. *Catalpa Bungei* is established in the Arboretum, where it appears perfectly hardy. This small tree is a native of northern China, where it is often planted in temple gardens, and was introduced by the Arboretum into the United States and Europe a few years ago. It has very dark green leaves, and small yellow flowers in small clusters, and, although it has not yet flowered here or in Europe, it will probably be of slight value as an ornamental tree. There is another plant usually called *Catalpa Bungei*. This is a dwarf, round-headed bush which is often planted in formal gardens, where it is frequently seen grafted on the tall naked stems of one of the tree species. This dwarf, which never flowers, is really a form of *Catalpa bignonioides*, and how it got the name of *Catalpa Bungei* is a mystery which will probably never be cleared up. The right name is *Catalpa bignonioides* var. *nana*, but nurserymen will probably continue to sell it as *Catalpa Bungei*. Two Chinese Catalpas raised from seeds collected by Mr. Wilson in the eastern part of the empire have passed successfully through the winter, but it is too soon to speak of their value. The Catalpas are planted in a large group on the eastern slope of Bussey Hill between the Ashes and the Elms, and above the bank occupied by the collection of Lilacs.

THE FLOWERS OF CHAUCER.

(Continued from page 402.)

GEOFFREY CHAUCER was born in 1340 and he died in 1400. He led a busy life, and was attached to the household of John of Gaunt. He was often abroad, but does not seem to have gone further south than Genoa. His remains were buried in Westminster Abbey.

In the account of his flowers I have used the edition edited by Robert Bell in 1855, for the edition of the English Poets, in eight 12 mo. vols. The references are to the volumes and pages. I do not say that this is the best edition of Chaucer's works, but it is the most convenient for my purpose. I do not enter into the question of the genuineness or otherwise of the poems from which the passages are quoted; it is enough for me to quote them as published in this edition. Still less do I enter into the question how far the poems quoted are Chaucer's original work or borrowed by him or translated. Chaucer did borrow largely, and translated from the French, Italian, and Latin authors; but in so doing he made them all his own, and has given them to English readers of all generations to their great delight.

I will only add that I shall be very glad to hear from any readers of these papers, if they will supply omissions or correct mistakes.

AGNUS CASTUS.

1. Some of agnus castus ware also
Chapelets freshe.
The flower and the leaf, IV. 242.
2. A braunch of agnus castus eke bearing
In her hand. *Ibid.*
3. In her honde the braunch she beareth this,
That agnus castus men calle properly.
Ibid, 255.

Vitex agnus castus grows as a shrub in South Europe and North Africa. It was grown in England by Gerard, but probably not in Chaucer's day, but he may have seen it when travelling in Italy. It is fully

described by Pliny, who describes its many virtues; being not only celebrated as a promoter of chastity, but especially for its power against poisons of all sorts. It can be grown in Southern England as a hardy shrub, and to many its strong aromatic smell is very pleasant. "The name *Agnus Castus*," says Gerard, "comes by confounding the Greeke name *Agnos* with *Castus*, the Latine interpretation thereof." An old English name for it was Abraham's Balm, which has not been explained satisfactorily.

AGRIMONY.

And herbes couthe I telle eek many oon,
As egrimoigne, valirian, and lunarie.

Prologue of the Chanounes Yeman, III. 32.

An old Anglicised form of *Eupatorium Agrimonia*, a common British plant, formerly credited with many virtues, but now considered harmless and useless. It seems never to have had any common English name.

ALDER.

Birch, asp, aldir. *Knights Tale, I. 182.*

The Alder when well grown is a great ornament of streams throughout the whole of the northern hemisphere. Its English name, with variants, has been in use since the eighth century, and is now supposed to have no connection with the Latin *Alnus*.

ALEYS.

Notes, aleys, and bolas.

Romaunt of the Rose, VII. 59.

Aleys is named among the fruits "of which many oon faine is." It is the fruit of the wild service tree, but the word is very rare, and is now obsolete.

ALMOND.

And almandres gret plente.

Romaunt of the Rose, VII. 55.

Almandre is the old French form of Almond. Its native home is in Western Asia, but it was probably grown in English gardens in Chaucer's time.

APPLES.

1. Hir mouth was sweete as bragat is or meth,
Or hoord of apples, layd in hay or heth.
Milleres Tale, I. 195.
2. Wel bette is roten appul out of hord
Cokes Tale, I. 237.
3. Ne every appel that is fair at ye,
Ne is not good.
Prolog. of Chanounes Yeman, III. 37.
4. Upon which rokke growth a tre,
That certeyne yerres beres apples thre.
Chauceres Dreame, VI. 65.

(Then follows a long description of the Apples, in which the word is often used, but in no case necessary for quotation.)

5. As rounde as appille was his face,
Ful rody and white in every place.
Romaunt of the Rose, VII. 40.
6. And many homly trees ther were,
That peches, coynes, and apples beere.
Ib. 52.
7. A foolis word is nought to trowe,
Ne worth an appel for to lowe.
Ib. 154.

In No. 4 "Apple" probably means only fruit, the word being often applied to any fruit. In the other quotations our common Apple is meant.

ASH.

1. So wodly, that lik was he to byholde
The box-tree, or the asschen deed and colde.
The Knights Tale, I. 150.
2. Wilw, elm, plane, assch. box.
Ib., I. 182.
3. The bilder oke, and eke the hardy asshe.
The Assembly of Foules, IV. 195.

* Arnold Arboretum, Harvard University. *Bulletin of Popular Information*, No. 8.

4. Maples, asshe, oke.

Romaunt of the Rose, VII. 59.

5. Asshe, firre, and oke.

Complaynte of a Lovers Lyfe, VIII. 8.

The Ash, one of the most beautiful of British trees, was far more abundant in Chaucer's time than it is now. In the South of England it is rapidly giving place to the Elm. Quotation 4 is from a list of trees given by Ovid, and afterwards copied by Spenser.

ASPEN.

1. Ook, fyr, birch, asp, aldir.

The Knightes Tale, I. 182.

2. His herte was so wood,

That lyk an aspen leef he quok for ire.

The Sompnoures Prologe, II. 102.

3. The aspe for shaftes plaine.

The Assembly of Foules, IV. 195.

4. Right as an auspen leef sche gan to quake.

Troylus and Cryseyde, V. 157.

5. Maples, asshe, oke, aspe.

Romaunt of the Rose, VII. 59.

6. And quok as dooth the leef of aspe grene.

Legende of Goode Women, VIII. 123.

The Aspen has been from very early times the proverbial example of restlessness. Pliny's "*Populus foliis ludentibus*" is probably the Aspen.

BALM.

1. As men a pottle ful of bawme helde

Amonge a basket ful of roses.

House of Fame, VI. 248.

2. The dewe also lyke sylver in shynynge

Upon the leves, as any baume swete.

Complaynte of a Lovers Lyfe, VIII. 6.

Balm in its present use is confined to the flowers and leaves of *Melissa officinalis*; but in Chaucer's time it seems to have been used for any sweet-scented preparation from the dried leaves, like our pot-pourri. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

(To be continued.)

NOTICES OF BOOKS.

SILVA OF CALIFORNIA.*

BOTANICAL knowledge of the Californian forests begins with the visits of Malaspina and the Vancouver expeditions, the first scientific voyages, save the La Perouse expedition, to touch Californian shores. The botanists attached to these expeditions made known to the European world the existence of *Sequoia sempervirens*, *Quercus lobata*, *Q. agrifolia*, *Arbutus Menziesii*, and several other trees. Since that period, 120 years have gone by, but, on account of the peculiar topography and extent of the State, and the restricted or local range of many species of its trees, botanical discovery has proceeded slowly. The author has given us in the present volume the result of field studies in nearly every part of California during the last 19 years. He has endeavoured to bring together the dendrological characteristics of the various species, their habits, form, seed reproduction, longevity, and relation to drought periods. Facts have also been gathered regarding nanism and spontaneous hybrids, and attention has been paid to the behaviour of trees attacked or mutilated by fire, animals, or man.

The author considers that there are five forest provinces in California: 1, Sacramento and San Joaquin Valleys; 2, South Coast Ranges; 3, North Coast Ranges; 4, Sierra Nevada; 5, Southern California. Extensive treeless tracts are the most characteristic features of the first of these, the wooded areas being thin and limited in extent.

* *The Silva of California*, by Willis Linn Jepson. *Memoirs of the University of California*: Vol. II., 4to., pp. 283, plates, 85, maps 3. (Berkeley: University Press.)

The South Coast Ranges have an average height of 2,000 to 5,000 ft. The Santa Cruz mountains and Santa Lucia mountains, facing the ocean, are forested with Redwood (*Sequoia sempervirens*), Douglas Firs, Tan Oak, and Madrona. A sketch map is given of the region about Monterey, showing the restricted range of four Conifers. The Monterey Pine (*Pinus radiata* Don), the Bishop Pine (*P. muricata* Don), the Monterey Cypress (*Cupressus macrocarpa* Hartw.), and the Gower Cypress (*C. Goveniana* Murr.).

The most marked forestal feature of the North Coast Range is the Redwood belt 300 miles in length. The Sierra Nevada rise from the plains of the Great Valley to heights ranging from 7,000 to 14,500 feet. The western slope is heavily forested with a great variety of Coniferous species. The Sierra Nevada forms the

predominance of Coniferous vegetation is most remarkable. Any explanation of the paucity of broad-leaved trees at the present time bristles with difficulties, as, down to the beginning of the glacial period, the remains of many are shown to have existed in the auriferous gravels of the West. Dr. Harshberger (*Phytogeographic Survey of N. America*, p. 261) states much may be attributed to glaciation, something to the tremendous outpourings of lava, much to the narrowness of the forest belt, to the want of summer rain, and to the most unequal and precarious distribution of the rainfall in winter.

In 1909, Dr. Jepson published his *Trees of California*. This work is a much smaller volume than the present one, and was primarily intended for use in the field, while the present large and somewhat bulky quarto, giving more

FIG. 16.—LÆLIO-CATTLEYA MARTINETHII "KING GEORGE": COLOUR OF FLOWERS, BRIGHT ROSE WITH CLARET-PURPLE LIP.

Exhibited by Messrs. Charlesworth & Co. at the Olympia Show (Award of Merit).

most extensive and most important forest region of the State. It includes 52 species.

Southern California possesses 57 species—a large number for so arid a region.

The number of species in California which may be called trees is 92, and 49 of these may be considered typically Californian.

The forests of California and those of the Eastern United States offer very striking contrasts. In California the Coniferae are so abundant, both in species and individuals, that the forests are exclusively or mainly composed of cone-bearing species. The most typically Californian broad-leaved trees are the Live Oaks (*Quercus agrifolia* and *Q. wislizenii*), Valley Oak (*Q. lobata*), Tan Oak (*Parsonsia densiflora*), Californian Laurel (*Umbellularia californica*), and Madrona (*Arbutus Menziesii*). There are no Hickories, no Elms, no Beeches, no true Chestnuts, and but one Walnut. In fact, the

elaborate details with regard to the botanical aspect of the subject, seems primarily intended for use in the study or the herbarium. There are 85 plates, reproduced from photographs and line drawings which add greatly to the usefulness of the work; also three maps, the first showing the distribution of the northern groves of *Sequoia gigantea*, the second the distribution of the southern groves, and the third a map of California designed to indicate the mountain chains, valleys, and river systems of most importance in relation to plant distribution.

As we have pointed out on a previous occasion, the author has a tendency to take an aggregate rather than a segregate view of species; but the present work shows evidence of a great many years of careful study and research, and it can be recommended as a trustworthy guide to the trees of California. E. G. B.

THE ROSARY.

ROSE WICHMOSS.

MESSRS. BARBIER & Co., of Orléans, have succeeded in obtaining an interesting cross between *R. Wichuraiana* (the seed parent) and the Moss Rose *Salet*. The stalks are thickly covered with straight, reddish prickles, of unequal length, some almost as fine as hairs (setae), and the receptacle at the base of the flower and the sepals are thickly covered with the moss-like appendages well known in the race of Moss Roses. The pink buds look very pretty peeping through this moss covering.

The raisers state that the plant is a very strong grower, making shoots from 5 to 8 feet in length. The flowers are semi-double, 2 to 3 inches across, rosy-white, tinted carmine rose underneath (i.e., on the reverse of the petals),

petals. The former class of hybrids produced plants that could be grown into pillars, but they were not climbers. The Rose before us may therefore be considered the first climbing Moss. Of late years the Mosses have been somewhat neglected in gardens, fashion having run rather in the direction of the climbing Roses, or, of such summer-flowering bush Roses, as the more showy single damask varieties, like *Lady Curzon*. The less gaudy Moss Roses have, for the time, had to give place, and there are probably not more than half-a-dozen Moss Roses now commonly grown. Perhaps a climbing Moss may revive interest in them. *Salet*, the pollen parent of *Wichmoss*, was introduced by Lacharme, as long ago as 1854.

ROSA HEMISPHERICA.

CANON ELLACOMBE's remarks on this Rose (see p. 7) only confirm my conclusions. He is much

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE DESTRUCTION OF CHARLOCK.—I hope readers of the *Gardeners' Chronicle*, especially those who have an interest in a farm as well as the management of a garden, will not take *W. P. R.* (p. 394) seriously when he infers that the destruction of Charlock amongst Corn is not practicable. I fear he is trying to persuade readers that the destruction of Charlock by spraying is impossible. I think, too, that he has only come to such a conclusion by seeing a poor attempt or in conversation with a half-hearted exponent of the practice. I live in a locality where Charlock is a pest on far too many farms, but on this farm I do not tolerate the growth of the plant amongst Corn crops to an injurious extent. I spray Oats and Barley once or twice

FIG. 17.—EXHIBIT ARRANGED BY MESSRS. WALLACE AND CO., AT THE OLYMPIA SHOW.

(See p. 16.)

carried in clusters of 6 to 15 flowers, and sweetly scented. The fragrance is preserved even in the dried specimens which have come to this country. The foliage appears to be a bright green, and of fair size and substance, the raisers call it large, and add that the plant is a true climber. From the length of the year's growth stated above, it would appear to be something of the habit of *Gerbe Rose*.

As the first of a new series of *Wichuraiana* hybrids, it is sure to prove interesting, and, seeing that it is to be distributed in the autumn, we may hope soon to see it in this country.

Some years ago the Moss Roses were much in vogue. Mr. Wm. Paul, in *The Rose Garden*, gave a list of over 40 of them, crosses being obtained both with the hybrid *Chinas* and the per-

farther south, where the climate is warmer, hence *R. hemisphaerica* does not produce the hard green eyes there which are so much against success here. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

ROSES FOR PERFUME.

JUDGED for sweet perfume only, the following 12 vases of Roses obtained the 1st prize, out of seven competitive collections, at the Rose Show held by the Festival of Empire, at the Crystal Palace on July 29:—*Francois Michelin, La France, Robin Lyth, Ulrich Brunner, Léopold Hausbourg, Augustine Guinoisseau, Zéphirine Drouhin, Viscountess Folkestone, Earl of Dufferin, Marie Pavié, Prince Arthur, and Gladys Harkness. Will Tayler.*

in a season, and can say that I get rid of the pest without injury to the Corn; in fact, I am certain the application of a spraying solution acts more as a stimulant to the Corn than an injury. I fear, too, *W. P. R.* displays much ignorance of farming when he advises the ploughing of the land, harrowing it, leaving it to fallow, then mowing the weed before the seed matures, ploughing again, and finally leaving it for the frost to destroy any plants that may have escaped previous ploughings and harrowings! I would ask *W. P. R.* when is the crop to be sown, let alone gathered? Under this system I do not wonder that "crops of recent years have not been very remunerative." The right time to spray Charlock amongst Corn is directly it shows the first rough leaf following the seed leaves. This is not always possible, because the weather may be continuously showery or windy and,

therefore, unsuitable for spraying. The rain dilutes the mixture, while rough winds prevent an even application of spray. Even if the Charlock gets into blossom before spraying is done the growth will be so checked as to prevent the formation of seed pods, and that is important, as it is during the time when seed pods are forming and filling that the plant is more exacting in its requirements from the soil than at any other period. By using 21 lb. of sulphate of copper as prepared by Messrs. Strawson for one barrel of water for their Mikado sprayer, $1\frac{1}{2}$ acres can be sprayed with satisfactory results. True, the tips of the blades of Corn will be slightly affected, but this is quite immaterial and quickly passes off. *E. Molyneux, Hampshire.*

TROPÆOLUM SPECIOSUM.—During the past 60 years I have made many trials to grow this lovely climber, but most of them ended in failure. Yet I feel sure that I have, at last, solved the difficulty attending its cultivation. I have given many plants to friends in the south of England, where it is looked upon as almost impossible to grow, and all who have followed my plan have succeeded. The essential point is to trench the ground deeply before planting, so that the tubers will have an easy rooting medium. After the trenching remove the soil for 8 inches deep, then place a layer of compost consisting of two parts fine loam, one part old farmyard manure, and one part leaf-mould; all the materials should first be passed through a fine riddle and well mixed together. Next lay the roots on this compost, put another 2 inches deep of the same compost on the tubers, and finish to the level of the ground with ordinary soil. Thus the roots will be 6 inches below the surface. Planting should be done in November, and be followed by a good watering if there is no frost. In the first season it may be desirable to apply water now and again during dry weather. From the very commencement of growth the plants must be given something to cling to, or the stems will get into a tangled mass. This lovely climber is well worth trying to establish. It is like lace amongst flowers, decorating everything it touches with its graceful foliage and brilliant, scarlet blossoms. *Ina Scott Elliott, Teviot Lodge, Hawick, N.B.*

BULBS DESTROYED BY GRUBS.—The Narcissus fly (*Merodon equestris*) appears to be extending its field of operations. On p. 7 Mr. Adams records it as destroying *Hippeastrums*. During the past winter we received it also in bulbs of *Vallota* and in *Habranthus pratensis* from different sources. The bulbs were destroyed completely in each case, and the grubs proved to be those of *Merodon equestris*. The Rev. W. Wilks informs me that he has found the same grub devouring Lily bulbs. *Fred. J. Chittenden, R.H.S. Garden, Wisley.*

A GOOD EARLY CULINARY PEA.—I am forwarding a few pods of Veitch's Acme Pea. The seeds were sown on March 1, the first pods were gathered on June 6, and we have been picking every day since. *Thomas Wickson, Paxton Hill House Gardens, St. Neots, Hunts.* [Some excellent pods accompanied this communication.—EDS.]

RED SPIDER ON VINES (see p. 394).—I do not altogether agree with Mr. Cox in his conclusions when he states that, "given a modern vinery, no one need be troubled with this pest." Modern vineries, more often than not, have shelves suspended conveniently near the glass for the special accommodation of successive batches of forced Strawberries and other plants, providing, so to speak, the open door for red spider. One may dip the Strawberries in solutions of soft soap and sulphur, syringe them with water daily until the berries commence to colour, and damp the borders and walls as freely as possible. Still red spider is found on the Strawberries. In my experience this is the way red spider gains a footing in even modern vineries. In regard to the sulphur treatment cited by Mr. Cox, I am afraid the fumes must have been excessively strong to have injured the vine leaves to any degree. I remember working in a vine nursery a few years ago, where sulphuring the pipes was regarded as a certain cure for this insect pest, and I do not think the vines were injured. I

have followed with interest the discussion on the starting of young vines, and I am of the opinion that, provided there is plenty of atmospheric moisture in the vinery, there is no need to syringe the eyes to induce them to break into growth. In the case of early vineries, I should lower the rods, in order to have the whole length of the rod in nearly as possible an even temperature. *M. Sargent, Rockshaw Gardens, Merstham.*

MELONS.—May I be allowed to record the fact that I have just cut five Melon fruits from one plant; four of them weighed 4 lbs. 13 ounces each, and the remaining fruit 4 lbs. 8 ounces. The plant, together with others, were planted at the latter end of March in frames, which had contained Violets during the winter. The variety of Melon is that known as Triumph. The fruits were all well netted and they possessed splendid flavour. *E. Hart, Hockley House Gardens, Twyford, Winchester.*

THE APPLE CROP.—Your correspondent *A Southern Grower* seems to be in doubt (see p. 1) whether the deficiency in the Apple crop has been caused by the recent drought or by imperfect ripening of the young wood in 1910. As regards the drought, it lasted here from May 15 to June 11 inclusive, yet grass and all established plants and shrubs scarcely suffered at all, and my hay crop, which was cut on June 23 and 24, was an average one. Even if the drought had reached the roots of the trees, the failure of the crop was apparent long before this could have happened. But, if it is admitted that the imperfect ripening of the young wood in 1909 was the cause of the partial failure of the crop in 1910, then the probability is that the same effect has been produced by the same cause this year. The following figures taken from the return of the Royal Observatory, Greenwich, in the monthly weather report of the Meteorological Office show that the climatic conditions in July and August, 1910, were worse in every respect than in 1909. And probably no one will deny that it is in these two months that the shoots are ripened.

		Mean max.	Abs. max.	Rain.
1909.	July	70.1°	78°	3.16 in.
	Aug.	72.9°	86°	1.80 "
1910.	July	67.0°	76°	3.52 "
"	Aug.	70.8°	77°	2.43 "

The Apple blossom was abundant, but I have noticed free blooming, followed by an inferior crop, on previous occasions after a cold summer. A smaller amount of ripening seems to be required for flowers than fruit. *Alfred O. Walker, Ulcombe Place, Maidstone.*

DECORATED LONDON.—We Britishers, it has been asserted, are not artistic; and Londoners must confess that the recent presentment of its vaunted city, en fête, dressed up for the crowning of the King, was not altogether harmonious. Let us take the results achieved by Piccadilly in the embellishment of the exteriors of their houses and clubs as typical of West End taste. To the democratic observer, the kaleidoscopic variety of the show was indubitable—if not "post-impressionist." One house appeared in blue, very prettily valanced like an Early Victorian four-post bedstead. An adjacent mansion was wreathed like a maypole in garlands of real red Roses. Another was quite handsomely and appropriately emblazoned in the armorial bearings and escutcheons of the family who owned it. A sufficient and suitable decoration in itself until it came to the delicate finishing touches, which, unhappily, took the form of gigantic wreaths of artificial Cabbage Roses. A little further on a residence appeared—or, rather, let us say, disappeared—behind an embossed green-paper covering of imitation Creepers and vines, which completely disguised it, and served as a background to a company of figures in suits of mail. Like knights on guard in shining armour, cap à pie, they stood on pedestals at intervals between the windows. Owing to their surroundings, the crowning absurdity of which were strings of moulded garlands of portentous appearance, arranged above and below the mailed figures across the façade of the residence, the knights were scarcely suggestive of a Norman origin. The suits of

mail may have been mediæval, but these pseudo-renaissance surroundings did their best to disprove it. These elaborate efforts in decoration were relieved occasionally here and there by the economy or the parsimony of a neighbour who contented himself with a plain, though generally a gaudily-coloured bunting that had evidently served more than one economical turn at previous ceremonials. It was not until the eye had travelled as far as Devonshire House that real taste in decoration appeared to view on any noticeable scale. Here was a charmingly-decorated scheme in "nattier" blue velvet draperies, relieved by hanging baskets of real yellow and white flowers and long, streaming pennons of the Devonshire colours, primrose and white, which reared above the stand and fluttered against the sky. Municipal taste along the road in Piccadilly achieved no better result than that of private individuals, owing to the use of artificial leaves and flowers, which became limp and hung discoloured far sooner than real ones. Municipal decorations in the City, on the contrary, were more successful, as seen on the Friday's Progress of their Majesties. Real trees and flowers were used in many cases, notably on London Bridge and in the Borough High Street, and some appreciation of the value of green in contrast to the greyness of the City surroundings, and in opposition to the brilliant reds and blue in our National flags and uniforms, was evinced in the City's scheme of colour decoration. *Mary L. Breakell.*

A BRITISH GARDENERS' PRIZE AT THE ROYAL INTERNATIONAL EXHIBITION.—I fully concur with a *County Honorary Secretary's* excellent suggestion (see *Gardeners Chronicle*, July 1, p. 428), with regard to gardeners subscribing to raise a fund to be offered in a prize or prizes to be known as the British Gardeners' Prizes. The Schedule committee has prepared such an excellent schedule of prizes that I would suggest that the disposition of the prizes should be left to this committee. Should the amount subscribed admit, a class should be arranged in each of the flower, fruit, and vegetable sections, and the squire's gardener should not be overlooked. *Another County Honorary Secretary.*

A DISEASE OF ORCHID LEAVES.—Considerable trouble has recently been caused in the Orchid house of the Cambridge Botanic Garden by the fungus *Hypodermium orchidearum*, a parasite which was first described by Cooke and Massee some years ago as the cause of a leaf spot of *Cymbidium eburneum*. At Cambridge this fungus has affected the leaves of several different kinds of Orchids, including species of *Thunia* and *Dendrobium*. The disease has usually begun to develop at the apex of the leaf, from which it spreads downwards until a considerable portion of the leaf is killed. The affected parts become discoloured, and on these dark spots soon arise, from which chains of colourless spores are produced. The spores, which are formed in chains, readily separate from one another at maturity. Tips of Orchid leaves often die from causes unconnected with the action of any particular organism, and from observations at Cambridge it appears that *Hypodermium orchidearum* frequently begins to live as a saprophyte on such dead portions, subsequently invading living tissues, after the manner of so many other injurious fungi. This disease may be checked by sponging the leaves with a dilute solution of potassium permanganate. *F. T. Brooks.*

SALVIA SCLAREA.—May I give the following account of *Salvia Sclarea* shown by me at Olympia, as I find it impossible to answer the enquiries of all those who have written to ask about it? The *Salvia* is quite hardy, and grows from 5 to 6 feet high. The heads are a lovely silvery mauve colour, and last from July to September, long after the pale blue flowers are over. The original seed was sent over from the Vatican garden years ago, and the name "Berkshire" variety has been given to it. The flowers were not seen in their real beauty at the show, as they do not travel well, but I shall be pleased for anyone interested in the revival of this scarce plant to come and see it here. *Alice Martineau, Hurst Court, Hurst, Bucks.*

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

STOCKS.—The type of intermediate Stock known as East Lothian should now be sown to ensure a supply of good sturdy plants for wintering in cold frames. Sow the seeds in the open or in a cold frame, and do not attempt to coddle the plants. As soon as they are large enough to handle prick off the seedlings into 48-sized pots, putting three good plants in a pot. Afford one good watering, and afterwards be chary of applying too much moisture: it generally suffices to merely damp the plants lightly until they are well rooted.

SCENTED-LEAVED PELARGONIUMS.—The flowering season of some of the scented-leaved Pelargoniums is now past, therefore the present time is suitable for thoroughly cleansing the plants. In the first place, remove all the old flower trusses and any faded leaves. This being done, carry out any tying that may be necessary, and afterwards encourage the plants to make fresh growth by treating the roots in a liberal manner. Such sorts as *P. capitatum* and *P. Radula* major will soon commence to grow, and continue until the autumn frosts compel the gardener to remove them to a position under glass. The dwarfier sorts, such as Countess of Devon, Pretty Polly, and Prince of Orange, will still continue to flower well in the open garden. If these latter varieties show a tendency to cease flowering, it will be well to dry them off partially and prune them lightly. Afterwards reduce the balls, if this is necessary, and repot them into good soil.

ALOYSIA (LIPPIA) CITRIODORA.—This plant like the scented-leaved Pelargoniums, is at present in the open garden. At this season the species has a tendency to flower, and, unless this is checked, it prevents the plants making strong growth and healthy foliage; therefore pinch out the flower-spikes. If standard or pyramids are desired, any plants now in comparatively small pots or tubs may be given a shift. They will need constant attention in regard to pinching the growths. Large specimens in tubs may be given occasional applications of manure, and they should be syringed freely to prevent red spider.

MYRTLES.—Specimen Myrtles must be kept in the best shape possible, both by tying and pruning any shoots that are extra vigorous. Young plants should be encouraged to grow freely, remembering that a Myrtle which presents a starved or stunted appearance is anything but attractive. Myrtles may be raised quite easily from seed, and the young plants grow quickly.

LAVENDER AND ROSEMARY.—In common with all the plants I am mentioning this week, the specimens of Lavender and Rosemary are accommodated out-of-doors at the present time. Lavender and Rosemary, though common enough in the open flower border, are not employed as pot specimens for terrace decoration so frequently as they might be. I strongly recommend their cultivation in this manner, for, in addition to their novelty, they have high decorative qualities. All they need during winter is the accommodation of an unheated greenhouse, and a slight frost will not injure them, provided the atmosphere is dry at the time. It may be said that, in both instances, the task of getting good stems to these plants is somewhat tedious, but the results are gratifying. If young plants are now taken in hand for pot culture, it will be possible to have them established by the autumn. They should be kept to single stems from the commencement.

RHODODENDRON INDICUM (AZALEA INDICA).—It is always desirable to expose Indian Azaleas to full sunshine when once they have completed their growth and the shoots have become somewhat hardened. At any rate, this is the best treatment for the greater portion of Britain, but in the more northerly countries, perhaps, a light, well-ventilated greenhouse is the better place for them. Azaleas should be examined

closely for signs of thrips, and if any of these insects are present the plants must be syringed freely and frequently. If they are still contained in the glasshouse they may be fumigated; but those which are already outside should be syringed with a weak solution of some insecticide containing nicotine, such, for instance, as the XL-All insecticide.

FIRES.—Every good gardener will take pains to check the fires early in the day during hot weather, even such fires as are employed for heating the warm pits and stoves. It would not cause harm if such houses were left without any fire-heat at all for a few nights during hot summer weather. At the same time, occasional fires are useful to dispel excessive moisture, this being their principal use at the present time. In sultry weather a little ventilation may be left on at the top of the house at night, even if the pipes are unheated, for no harm will be suffered by the plants if the morning temperature is not lower than 65°.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

ROSES.—It is the practice in the warmer parts of the country to shorten growths of hybrid perpetual Roses to induce the production of shoots that will flower in the autumn. In the north it is preferable not to prune, but to let the shoots develop, when usually flowers are produced at their tips. Climbing Roses are making great progress, and should have attention weekly, tying the shoots and arranging them in the positions to be occupied next year. Those who possess the old *Rosa sulphurea* should prune their plants now. The variety flowers profusely at Tynninghame, and all the pruning the plants receive is the excision of the growths which have borne the lovely yellow blossoms, just enough young shoots being retained to furnish another season's bloom. It is probably because this Rose is so often pruned in the same manner as other Roses that the species fails to grow well in many gardens.

SWEET PEAS.—We have never had finer Sweet Peas than the earlier flowers produced this season, but more recently the flower-buds on one long row of plants have dropped persistently. In another part of the garden the trouble is not evident. It appears to be a fact that some varieties are more liable to bud-dropping than others. Of those which have retained their flower-buds best are Hugh Dickson, Etta Dyke, and Dazzler. Dazzler is one of the finest salmon-scarlet varieties in our collection, being much more effective than Nancy Perkins or Earl Spencer, though probably inferior to such sorts from the exhibition standpoint. Many complaints reach me of Sweet Peas failing to grow satisfactorily, even though watered during the drought. The only reason I can suggest is that the soil has been left in too loose a condition. When the ground is trenched in autumn for Sweet Pea culture, it is usual, in our case, to have the soil compressed by the feet as the work proceeds, and I think such treatment is essential in gardens where the soil is of a porous nature.

LOBELIA.—The taller Lobelias are developing their flower-spikes, and require some support; but although the plants may grow several feet in height, they do not need stakes of more than a foot high above the level of the ground. Both Lobelias and Pentstemons are benefited by applications of manure water during dry weather.

LAYERING OF CARNATIONS.—It is desirable to push forward this operation in late districts so that the plants may be nicely established by the beginning of September, when they should be planted out or placed in pots. Though the process of layering is a simple one, there are, nevertheless, many failures. These are generally due to carelessness. It is not uncommon to see the layers with their tongues lying on the surface, or to see them broken from the plants, or even to find that, whilst fresh compost has been provided for the layering, the tongue of the layer has been planted below such compost, and, therefore, in the ordinary soil. In order to prevent the tongue from becoming raised, the layering pegs should be pushed into the ground in a slanting direction, as they will hold better and retain the layer in its proper position. In order to pre-

vent the layer from breaking away from the plant, twist it previous to putting it down. Shoots which are placed high up on the stem should be brought down with the whole plant close to the ground.

PENTSTEMON.—In the case of most Pentstemons, short, stout stakes are necessary to support the plants; but there are some exceptions. For instance, Newberry Gem, if planted rather closely together, need not be staked, differing greatly, in this respect, from Preston Hall Seedling and other varieties of taller habit. The dwarf-growing Pentstemon heterophyllus is improved in appearance by having short, light canes to support the slender shoots. Some strains of the florists' section are comparatively dwarf, and scarcely need to be staked; but such strains are less effective than the tall-growing sorts, which flop about in the first heavy shower, unless they are properly secured.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

THE ORCHARD HOUSE.—As the various crops in this house approach the ripening stage, the use of stimulants should be withheld and only clear water applied; syringing should be discontinued, and the necessary atmospheric moisture must be promoted by damping the ground surfaces freely. Pot trees now swelling their fruits require strict attention to watering and feeding. It is scarcely possible to admit too much air in hot weather, and ventilation should be employed during warm nights. Support the fruits of Apples and Pears with stout pieces of raffia. Apples will be improved in colour and finish if the trees can be removed out of doors into a suitable position, facing to the south or south-west, plunging the pots in the soil and covering the trees with fish netting. Water carefully as before, and continue to syringe the plants twice daily with clear, soft water. If rain water is not to be obtained, then for preference use water that has been exposed to the sun and air. Attend to the watering and syringing of those trees that have passed out of fruit and are plunged out-of-doors; these should be given occasional applications of manure.

YOUNG VINES.—Those that were planted out in borders will now need cooler conditions and increased ventilation. Allow the leading shoots to grow without check, as this will tend to increase the number of roots in the border. Syringe the plants well and damp the houses as often as necessary, keeping the border well supplied with water. Young Vines that have been grown in pots for planting out or fruiting, will need gradually inuring to more air, and may ultimately be placed out-of-doors where they will ripen their growth. Place the pots on a firm base, where they cannot become waterlogged and earthworms will not reach them.

GENERAL REMARKS.—During hot weather admit abundance of air to all the houses. In the case of vineries that are none too well built, it will probably be found difficult to get enough circulation of air and a few scorched leaves will result unless the roof is slightly shaded. Where houses contain Grapes that are now colouring, a fair amount of air may safely be allowed to remain on all night, both at the top and the front ventilators. Afford water to the borders as often as necessary, and manurial assistance if a stimulant is desirable. Late Grapes should be examined once more before they get too large and berries removed where necessary. Attend to the stopping of the laterals before these come into contact with the roof glass. Thoroughly damp all the surfaces of the house frequently when the weather is warm. If fire heat is still employed, and the pipes allowed to get warm at night, the paths of the house should be damped last thing, but if the fires are out of use, this is unnecessary. Vines which have been cleared of their fruit should be syringed as previously advised, and the lateral growths allowed to extend. The lateral shoots should never be severely restricted on Madresfield Court, as freedom of growth often prevents the fruit splitting, though, as I have previously stated, the best preventive is early ventilation and allowing the top ventilators to remain open in the evening.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

PHALÆNOPSIS.—Nothing could be more suitable for these Epiphytes than the tropical weather which prevails as these lines are being written. But owing to the great heat every means must be taken to promote atmospheric moisture. Quick growth is essential just now, provided the growth is consolidated as it is made. Ventilate freely whenever the weather is favourable, and draw up the blinds about an hour before the sun ceases to shine upon the house. Plants which were repotted about last March being well established are now rooting freely in the new compost, therefore, they require an increased supply of moisture at the roots, but even now this should not be overdone. I am not in favour of much overhead moisture for these Orchids, and look upon spraying the foliage, even in the hottest weather, as a dangerous practice in the hands of inexperienced men. In certain cases it is advantageous, for instance, plants that were potted late and have not made many roots, must not be given frequent root-waterings, but they may be greatly assisted on bright days, when the atmosphere is dry, by light overhead sprayings. Insects should never be allowed to gain the least foothold on *Phalænopsis*, as sponging can scarcely be carried out without bruising the foliage. For this reason soft water should always be used, as hard water leaves a deposit on the leaves necessitating some force to remove it, and it is injurious to the roots. A few species of *Phalænopsis* sometimes produce young plants at the joints of the flower spikes; this occurs in the case of *P. Ludemanniana* perhaps oftener than in any other species. Whenever the spikes, then, are seen to keep green after the blossoms are passed, it will be worth while to leave them for a time if young plants are desired, and later on, should the joints of the old flower spike be seen to be swelling and forming tiny leaves, peg the spike down upon the surface of the rooting material of the parent plant.

THUNIA.—The *Thunias* having ceased to flower, should now be given a position in a well ventilated house where they can be exposed to full sunshine, and be syringed twice or thrice daily. It is from the flowering stage onwards until the leaves begin to fall that *Thunias* are often most neglected. This is a great mistake, for next to the strength and health of the plants the main factor in the production of abundance of bloom is the thorough ripening of the old pseudo-bulbs. Water should be afforded freely to the roots until the autumn, when the leaves begin to decay; then the amount must be reduced gradually until the foliage has all fallen, when the plants should be rested in a light, dry position in a cool house, and watering should cease.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

UNHEALTHY TREES.—It will sometimes happen that, although the soil has been properly prepared and the trees have appeared healthy, yet after a year or two some show a sickly condition, with the foliage pale in colour, and the growth weak. Unless remedial measures are undertaken such trees will ultimately fail altogether. In cases where the trouble is only accidental, corrective root treatment may commence early in the season, as soon, in fact, as the tree assumes a generally unhealthy appearance. A tree will sometimes become weakly and stunted in growth from having been planted in a careless and improper manner; this I have sometimes found to be the case with those trees, that previous to being planted in the border, had been grown in pots. The roots having been thus confined, they were matted together to such a degree, that it was almost impossible for them to penetrate into the surrounding soil, whereas, had the roots been disentangled and properly spread out, the tree would in all probability have become quickly established. In such cases, the tree should be taken up again, and replanted early in autumn. Where planting has been correctly carried out, and the soil properly prepared, and the tree appears unhealthy after the first or second season, the application of manure water to the roots will very often bring about an improvement,

especially if the soil is allowed first of all to become somewhat dry, before moisture of any kind is administered; this will prevent the soil from becoming sour or overcharged with moisture. First of all, let the border be well watered with clear water, and, after an interval of two or three days, saturate the soil with a stimulant such as manure water obtained from the use of cow manure and soot; such a mixture might be applied several times during the season, allowing the border to thoroughly drain itself of superfluous moisture before repeating the application. If the soil in which the tree is planted is unusually stiff or cold, the addition of a little Peruvian guano or fowl manure might be given with advantage. Whilst attention is being given to the roots, the foliage should be syringed every day, or at least every alternate day during favourable weather. In some instances a tree may become weakly and diseased from having the roots bruised and damaged at the time of taking up and replanting, the damaged portions not having been removed. When this is suspected to be the case it is advisable to take up the tree and examine the roots, cutting away any diseased parts before again replanting. A tree that has been planted in a suitable soil may also become unhealthy by reason of the soil becoming poor; a heavy mulching of manure and copious supplies of manure water will often bring about a healthier condition, and render the tree productive. Sometimes trees are unhealthy through being placed in an unsuitable situation; this is frequently the case with Pear trees, soil that is wet and cold causing the roots to remain in a stagnant condition.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

SWEET MARJORAM.—The stock of this herb should be ready for planting out on a south border, where the plants may remain until the beginning of October. They should then be carefully lifted and potted into 6-inch pots and placed in a cold pit, where the lights can be closed for a few days until the plants begin to make new roots, after which period the roof may be removed during mild weather, to be replaced on the approach of frost.

SPRING CABBAGE.—This is one of the most important crops in the vegetable garden. Two sowings should be made, the first about July 10, and the second a fortnight later. The bed on which the seeds are to be sown should be one which is fully exposed to light and air, so that hard, short-jointed plants may be obtained. When the soil has been dug and made level, it should be trodden lightly, and shallow drills drawn at 1 foot apart; the seeds should then be sown thinly so that no crowding of the young plants may take place. A net should be placed over the bed as a protection from birds. When the young plants appear, a careful watch must be kept for slugs, which may be readily destroyed by dusting the bed with hot lime early in the morning. Favourite varieties at Windsor are *Flower of Spring*, *Offenham*, and *Ellam's Early*.

CELERY.—Careful attention should be given to earthing-up the early plantations of Celery. As soon as the plants are of sufficient size, they should be divested of all side shoots, and any leaves which appear worthless. Afterwards the leaves should be gathered together with the hand and tied with some soft material, which may be removed after sufficient soil has been placed about the plants to keep them together. Choose a fine day for the purpose, and be careful that none of the soil is allowed to get between the leaves or into the heart of the plants. If the bed is at all dry, a thorough soaking of soft water should be given on the night previous to earthing-up the plants. Continue to make further plantations for late supplies; lift the plants with great care, and keep as much soil about the roots as possible. Directly the planting is finished, the bed should be freely watered to settle the soil about the roots. Frequent light dustings of soot may be given throughout the growing season to keep the Celery fly in check.

SHALLOTS.—These should be harvested as soon as possible after the tops begin to die. If left in the ground too long, the bulbs may make fresh roots and their keeping qualities suffer accordingly.

LATE BROCCOLI.—These plants should be put out as soon as the ground is available for the purpose. It is important that this batch should be planted in an open position, away from the influence of trees. The soil should be made firm before the plants are put out, and spaces of at least 2 feet should be allowed between the plants. The land on which this crop is planted should not be too rich. Before the plants are lifted from the seed-bed a thorough watering should be given, and the ground loosened with a fork, so that the roots may not be injured in taking them up. After planting, a good watering should be given.

HERBS.—Herbs raised from seed should now be pricked off in beds where they may stand the winter and from which permanent plantations may be made next spring. Sweet Marjoram raised from seed and pricked out in boxes may be planted on a south border, where the plants should remain until the beginning of October, when they may be potted up and placed in a slightly-heated pit for winter use.

THE APIARY.

By CHLORIS.

TAKING BEES TO THE HEATHER.—Those who live within reasonable distance of heather-covered moorlands must consider which hives may safely be removed, for all will not bear removal either by rail or wagon. Choose those stocks where the foundation is wired in, otherwise the jarring will break down the combs which are always very soft and heavy with brood at this season of the year. Further, those hives are only worth removal that possess a productive queen and are full of bees. In many instances it will repay the beekeeper to strengthen up the chosen colonies with driven bees, or to unite other stocks with them, making two colonies into one. As to packing hives for travelling, first remove all supers and place across the frames two stout laths near the ends, screwing these firmly down to prevent shaking. Nail perforated zinc across the entrance and over the frames, then let the whole hive be securely roped together. Let those who know the nautical "half-hitch" use it when roping, this being the most reliable of knots. If the hives are to travel by rail, label them conspicuously as "live bees," if by wagon, place the hives on a bed of straw to lessen the jolting. Let the packing be performed at night when all is quiet. When the moorland is reached, place the hives in a widely-spreading circle, facing outwards.

LOSS OF QUEEN.—There is one great danger liable at any season of bee life, but doubly to be watched for at this critical time of a short honey flow, that of the sudden death of a queen. The loss can be easily detected by the frightened and erratic movements of the inmates. In the usual course of events, about three weeks must elapse before another queen can be hatched and ready for work. By this time the honey flow will be over and the whole colony will give no return for the expense of taking them to the moor. It is possible to prevent this loss of valuable time by having extra queens at hand to replace the dead one immediately. As many queens as desired may be taken in a specially-constructed hive, possessing as many entrances as desired, but one roof, allowing one frame and only two or three hundred bees for each queen. If the loss of the original queen is detected at once, the new queen should be introduced by the entrance, and in an hour or so the bees will have resumed their labours. Should some hours have elapsed before the loss becomes known, the new queen must not be introduced until night.

PECULIARITIES OF HEATHER HONEY.—Moorland honey, except where wild Sage is sufficiently plentiful to thin it, is much too thick to be extracted by the machine. For this reason, it is best to use sections for its storage, as much valuable, drawn-out, frame comb is destroyed when pressing out the honey. Let the storing space be well in advance of the needs of the colonies, and let it also be remembered that it is not possible to wrap up the crates too warmly; though the days are warm at this season, the nights are chilly. Brown paper is an excellent non-conductor, and may be placed between the quilts, tucking all well down at the sides and corners.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 15—
Wood Green Fl. Sh. Edgware and Little Stanmore Fl. Sh.

TUESDAY, JULY 18—
Roy. Hort. Soc. Com. meet. (Lecture at 3 p.m. by Mr. W. Rickatson Dyke, M.A., on "Iris"). Highland and Agric. Soc. Sh. at Inverness (4 days). Portsmouth Fl. Sh. (2 days). Nat. Gladiolus Soc. Sh. at R.H.S. Hall.

WEDNESDAY, JULY 19—
Ulverston Rose Sh. in conjunction with Nat. Rose Soc. Newcastle-upon-Tyne Fl. Sh. (3 days). Nottingham Fl. Sh. Liverpool Hort. Assoc. Sh. Uxbridge and District Fl. Sh.

THURSDAY, JULY 20—Rochampton Fl. Sh.

FRIDAY, JULY 21—
Hort. Club Outing to Friar Park. Handsworth Fl. Sh. (2 days).

SATURDAY, JULY 22—Paisley Florist Soc. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63° 2'.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, July 12 (6 P.M.): Max. 77°; Min. 61°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 13 (10 A.M.): Bar. 30° 5'; Temp. 75°; Weather—Sunshine.

PROVINCES.—Wednesday, July 12: Max 77° Yorkshire; Min. 64° Berwick.

SALES FOR THE ENSUING WEEK.

MONDAY—
The Freehold Horticultural Property, "Redlands Nursery," Emsworth, Hants., with Cottage, 81 Greenhouses, Buildings, &c. Area, 3½ acres.
Compact Freehold Property, Alexandra Nursery, Chichester, with Residence, Greenhouses, &c. Area, 1½ acres, by Protheroe & Morris, at the Mart, E.C., at 2.

WEDNESDAY—
Blocks and Plots of Freehold Land at Dartford, suitable for Horticultural purposes, by Protheroe & Morris, in a marquee on estate at 4.

FRIDAY—
The Freehold Fruit-growing Property, "Dukes," Bradninch, Devon, with Residence, Greenhouses, &c. Area, 8 acres planted Fruit, by Protheroe & Morris, at Half Moon Hotel, Exeter, at 8.

The National Rose Show.

The National Rose Society's metropolitan exhibition was held in glorious weather on the 7th inst., and is duly reported in this issue. The comfort of visitors was well served by the honorary secretary, Mr. Mawley, who, remembering the unpleasant conditions caused by adverse weather in past years, took advantage of the structure recently erected for the Coronation Ball; thus he secured a large tent with a double roof and ample means of ventilation.

Early in June, when the hot sunshine caused the Hybrid Teas to open earlier than their usual period of flowering, it was confidently prophesied that 1911 would be found to be most favourable for the Hybrid Perpetuals, and the dull weather of the latter part of June seemed to render this forecast increasingly probable. The result, however, has not been according to expectations, for, if we can except Frau Karl Druschki, Hybrid Perpetuals were few in number and poor in quality. Indeed, the show has once again proved the success of the Hybrid Teas and decorative Roses.

Owing to the great heat most exhibitors were compelled to trust to their younger flowers. Nevertheless, the blooms suffered severely, and there was a general impression that even in the winning stands the flowers were smaller than usual. It was surprising to note how well the variety Avoca withstood the heat; it is rather a thin, but perfectly-shaped flower, and, as may be seen also in the variety Killarney, the inner petals seem to fold over the

centre and preserve the Rose for a considerable time. It is a beautiful and bright flower, with sweet scent, and it gained the medal offered for the best H.T. in the amateurs' classes.

The exhibition was a great event for Irishmen. For the third year in succession they were able to win the Nurserymen's Challenge Trophy. Mr. Hugh Dickson and Messrs. Alexander Dickson and Sons showed boxes of excellent blooms in the Champion Class, in which Messrs. Harkness & Son were the only English firm which secured a place. Mr. Hugh Dickson's collection of 72 blooms was noteworthy for its excellent flowers of some of the newer varieties, such as Leslie Holland, Mrs. Stewart Clark and King George V.

Among the amateur cultivators Mr. Lindsell appears but little affected by good or bad seasons, and he was able once more to take the position as Amateur Champion he has occupied at so many exhibitions.

The decorative Roses formed a prominent feature of the show, and probably neither Messrs. G. Paul & Son, who obtained the first prize for a group of Roses arranged on the floor, nor Messrs. W. & J. Brown, who won the premier award in the class for a group arranged on the stage, have ever produced more beautiful effects. Less elaborate but both tasteful and fresh was Mr. Mattock's exhibit of 36 garden Roses, which won the "Turner" Cup. The small, yellow Rose Peggy and the variety Simplicity were noticeable. Simplicity, white and nearly single, is a difficult Rose to show well.

The new section for perpetual flowering garden Roses was intended to provide for the heavier varieties found particularly among the Hybrid Teas and Teas, such as Mme. Leon Pain, Richmond, and Mme. Abel Chatenay, which are capable of decorative arrangement, but are intermediate between the typical garden Roses and the exhibition varieties. Three methods of staging were provided for in the schedule, namely, in baskets, in vases, and in exhibition boxes. The exhibits shown in this section in baskets, except where the flowers were a little too crowded, provided a very good effect, but in the vases and boxes there seemed to great a tendency to introduce single and semi-double Roses. A spray of single Roses, set up in an exhibition box, produces an incongruous and distressing effect. Perhaps another year something might be done to indicate more clearly what is desired. This criticism, however, in no way applies to the winning exhibit in the nurserymen's section, for the arrangement of colour in that case produced an exceedingly rich effect.

The tent for new Seedling Roses and sports was as popular as usual, and all day long visitors waited their turn to enter. On the whole the novelties were disappointing, but there was one beautiful new Rose, obtained from Pernet Ducher, with long shell-like petals and a brilliant orange-coloured centre, becoming towards the outside a pale but clear yellow, or to describe it in terms of other Roses, the centre was like Lena with the least wash

of vermilion, whilst the outer petals resembled those of Harry Kirk. It was shown in perfect condition, and, though rather small, is very beautiful. This variety has been given the inappropriate name Sunburst.

The president, Rev. Joseph Pemberton, received a Silver-gilt Medal for the little cluster Rose Danæ he first showed last autumn. It is bright and pretty, a pale-yellow as shown, and if it will keep its colour and flower well from June until October it should be a valuable acquisition.

The Society may well be proud of the taste shown by its lady members. Their influence was apparent in the arrangement of decorative exhibits in various parts of the show, but it was supreme in the special tent which contained the bowls and vases, the baskets, and the table decorations. It is with no lack of admiration of the artistic merit of many of the exhibits that we venture to offer some criticism. The bowls and vases were again strong classes, and so good, that judging was a difficult task, the winning vase of Irish Elegance being particularly fresh and beautiful. But in some cases the Rose had been denuded of its foliage, and leaves of R. rubrifolia, or other tinted Rose foliage, substituted. Charming effects were obtained by this method, but to those who live much among their Roses, and get to know their natural setting, it comes as a slight shock to see their old friends in these new garments, and rosarians are not willing to admit without question that the novel method is more artistic than nature's model. The baskets are always subject to changes of fashion, and the present tendency seems to incline towards decorating the handle at the expense of the basket. Within limits this is legitimate, for the class is necessarily artificial in character, but the limit is nearly reached, and there is the danger of exaggeration. Perhaps no classes at the show are more criticised than those for table decoration, and few are more attractive. In a sense we all have a personal interest in this class, for the decoration of our dinner tables has become a universal practice, and what flower is more interesting for the purpose than the Rose? It is not always remembered, however, that one of the qualities most desirable in a dinner table decoration is that it should give a certain sense of repose, and should charm our eyes without disturbing them by contrasts of colour or material. For these reasons, it is desirable to use one variety of Rose only, without the addition of Fern or foliage other than leaves of the Rose itself, and it may be urged by some that single and double Roses of the same shade should not be employed. Nevertheless, this combination was tried with good effect by two competitors, who had cleverly arranged together the Lyon Rose and Irish Elegance. Tried by the strict test, no doubt some of the tables would fail to pass with honours, but it must be remembered there are many diners and many tastes. One of the most pleasing tables was arranged with the single-flowered sprays of a Rambler Rose; it was charming in its freshness and simplicity.

RHODODENDRON LODERI. FLOWERS, WHITE.

A HYBRID RAISED BY SIR EDMUND LODER, BART., FROM A CROSS BETWEEN R. GRIFFITHIANUM AND R. FORTUNEI.

OUR SUPPLEMENTARY ILLUSTRATION.—A few years ago, writes W. W., Sir EDMUND LODER crossed *Rhododendron Griffithianum* (Aucklandii) and *R. Fortunei*. The former is a Himalayan species, which has been in cultivation for about 50 years. It is described as forming a stout, spreading shrub or tree up to 40 feet in height, and it is distinguished by the young growths being clothed with long, rose-red bracts, by the flowers being in loose heads and on long pedicels, and by their large size, 6 inches or more in diameter, their shape being more like a saucer than a bell; they are pure white and very fragrant. *R. Fortunei*, a Chinese species, was introduced in 1859. It forms a shrub up to 12 feet in height: the flower-heads are loose, the flowers saucer-shaped, and about 4 inches in diameter, generally 7-lobed, very fragrant, white or tinged with rosy-lilac. These two species are so nearly related that they have been considered to be geographical forms of one species. Numerous hybrids have been raised in gardens from each of these two species, such, for instance, as *kewense*, *Manglesii*, *Beauty of Tremough*, *Luscombei*, *Duke of York*, and *Pink Pearl*. But no one appears to have considered it worth while to cross *R. Griffithianum* with *R. Fortunei* until Sir EDMUND LODER attempted it, and his object was to prove that these species were the parents of *R. kewense* rather than to create another hybrid. The result of the cross was to produce a number of distinct seedlings, all fairly intermediate in character, but showing some variety in size and colour. Mr. (now Sir FREDERICK) MOORE and I saw them in flower at Leonardslee last June, and we agreed in the opinion that they were most valuable additions to garden *Rhododendrons*, probably the most valuable of all the direct hybrids so far raised directly from *R. Griffithianum*. The flowers were quite 6 inches in diameter, they had six segments, were fragrant, and they varied in colour from clear ivory white to a soft rose. The best of them had been named by Sir EDMUND LODER in compliment to various people, but it was clear that they must all be brought under one family name as in the case of *kewense*, *Luscombei*, &c., and it was decided to call them *R. Loderi* with varietal names also for the distinct forms. Sir EDMUND LODER and his gardener, Mr. W. A. COOK, have earned the gratitude of lovers of *Rhododendrons*, and added to the glory of the celebrated garden at Leonardslee by raising this beautiful hybrid. So far it has proved quite hardy in its place of origin, and as *R. Fortunei* is hardy in many parts of the British islands, we may reasonably expect *R. Loderi* to be so. The other parent, *R. Griffithianum*, is too tender to be grown out-of-doors except in the most favoured gardens. It is as well to add that the seedling *Rhododendron* known as *Loder's White* is of unknown origin, although it bears traces of *R. Griffithianum*. It has comparatively small white flowers, and is remarkably free. In Cornwall it has become popular for pot culture, as it bears forcing well.

HORTICULTURAL CLUB.—The annual outing will take place on the 21st inst., when the members and friends will visit Friar Park, Henley-on-Thames, the residence of the Vice-President of the club, Sir FRANK CRISP. The party will travel by rail from Paddington to Reading by the 10.33 a.m. train, and from Reading proceed to Henley by a launch provided by Sir FRANK CRISP. After luncheon at Henley, provided by the Vice-President, an inspection will be made of the Friar Park Gardens, including the Rockery. On the return journey the party will proceed from Henley to Marlow by launch. Tea will be taken at Marlow, and, afterwards, the return journey will be by train from Marlow

Station to Paddington, arriving at this latter place at 9.30. The Hon. Secretary, Mr. R. HOOPER PEARSON, requests that members who desire to join the excursion will send their remittances direct to the Hon. Treasurer, Mr. HARRY J. VEITCH, Royal Exotic Nurseries, Chelsea.

SIR FRED. W. MOORE.—As these pages are being prepared for the press an intimation reaches us from Dublin to the effect that His Majesty the KING has personally conferred the honour of knighthood on FREDERICK W. MOORE, M.A., V.M.H., Keeper of the Royal Botanic Garden, Glasnevin. This intelligence will be received with general enthusiasm, and by gardeners especially, not only because the KING's gracious act confers an honour upon horticulture, but also for the great esteem in which "MOORE of Glasnevin" is universally held. It will be remembered that the last honour he received was that of "M.A." *Honoris Causa* conferred by the Royal University of Ireland in November, 1909. On that occasion we referred to the excellent work Mr.

SIR FRED. W. MOORE, M.A., V.M.H.

MOORE has done for the Irish Board of Agriculture in spreading information on fruit and vegetable culture amongst the Irish farmers. Our congratulations to the "Keeper of Glasnevin" and Lady MOORE will be echoed heartily by every reader of these lines.

"THE BOTANICAL MAGAZINE."—The issue of the *Botanical Magazine* for June includes a very large plate of *Cattleya Rex*, tab. 8377. This species was first described by Mr. JAMES O'BRIEN in *Gardeners' Chronicle*, December 13, 1890, p. 684. The flower is very handsome, the ivory-white sepals and petals being set off by a yellow and purple-coloured lip.

COLUMNEA GLORIOSA, tab. 8378, is a very showy species of the Gesneraceæ, the colour of the flowers being scarlet with a suffusion of yellow on the face of the corolla tube. This *Columnea* makes an excellent basket plant.

PROSTANTHERA PULCHELLA, tab. 8379.—This species forms an under-shrub about 1½ feet high, with slender, graceful twigs, terminating in

racemes of lilac-coloured flowers with a few dark purple dots in the throat. The species is a native of New Zealand, and specimens have flowered in the open at Trescoe Island, Isles of Scilly, but the plant will probably require the protection of a temperate house in most localities in this country.

PTERONIA INCANA, tab. 8380.—The *Pteronias* are small, South African shrubs, and *P. incana* is found wild over a large area extending from Lesser Namaqualand to Albany. It forms a bush about 3 feet high, and produces a wealth of blossoms remarkable for their sweet Peach-like odour. The plant does not flower freely at Kew; the specimen from which the illustration in the *Botanical Magazine* was prepared was obtained from La Mortola, Ventimiglia.

SAUSSUREA VEITCHIANA, tab. 8381, is a Thistle-like plant introduced by Mr. E. H. WILSON from China whilst collecting on behalf of Messrs. JAMES VEITCH & SONS.

THE ROYAL VISIT TO IRELAND.—The gardens at Dublin Castle were specially planted on the occasion of the KING's visit by Messrs. CHARLES RAMSAY & SON, Ballsbridge. This firm also arranged the bouquet of pink Carnations presented to QUEEN MARY by the Kingstown Council, and the bouquet of Orchids presented by Lady GARDNER on behalf of the Pembroke Reception Committee.

ATTEMPTED SHIPMENT BY AEROPLANE.—A letter we have received from the *American Florist* contains details of an attempted shipment by aeroplane at the instance of Mr. W. ATLEE BURPEE, the well-known seedsman, of Philadelphia. Mr. BURPEE had contracted with a store for the delivery of the package before sailing, and the store in turn engaged Mr. THOMAS SOPWITH, the English aviator. On the 28th ult., with Mr. RICHARD R. SINCLAIR, Secretary of the Aero Club, holding the package, Mr. SOPWITH timed his flight to meet the White Star liner "Olympic" in the narrows. While Mr. SOPWITH controlled the aeroplane, Mr. SINCLAIR dropped the package at the given signal, but, unfortunately, the news comes by wireless telegraphy that the package fell into the sea and not on the deck of the liner. Mr. BURPEE was accompanied on the passage by Mr. E. W. KING, of Messrs. E. W. KING & Co., Coggeshall, and Mr. E. J. CULLEN, of Messrs. THOMAS CULLEN & SONS, Witham.

NEW ROSES AT BAGATELLE.—The final inspection of new Roses planted at Bagatelle in 1910 took place on June 14, when the following awards (*Le Jardin*, June, 20, 1911) were made:—Gold Medal for French Roses was awarded to *Beauté de Lyon*. Jonkheer J. L. Mock, a Dutch Rose, comparable with *La France*, but larger, obtained the Gold Medal for foreign Roses. Among Roses commended by the Jury were:—Viscountess Enfield (orange), May Millers (white, rose flush), William Speed (white, delicately tinted). *Climbers*: *Desiré Bergera*, flowers very abundant, white and yellow, and *Flower of Fairfield*, a variety which resembles *Crimson Rambler*, but blossoms all through the season.

NEW PLANTS AT THE SPRING EXHIBITION (PARIS).—The following Certificates of Merit were awarded at the Exhibition du Cours-le-Reine, and published in *Le Jardin*:—MM. CAYEUX-LECLERC, *Campanula longistyla parviflora*; MM. CAYEUX-LECLERC and MAISON FÉRARD, *Anthemis Mme. Sander*; M. VALERAND, *Gloxinia Goliath* and *Begonia Souvenir de République*; M. FÉRARD, *Viola cornuta excelsior*; M. MOULLÈRE, several varieties of *Hydrangea hortensis*.

THE LATE DR. BOLUS AND THE SOUTH AFRICAN COLLEGE.—The will of the late Dr. HARRY BOLUS, F.L.S., of Kenilworth, near Cape Town, contains a munificent provision for scientific and educational objects. His herbarium and library are left to the South African College, Cape Town, an institution in which he had previously shown his interest by a large contribution to the foundation of the Chair of Botany, which is called by his name. He leaves a sum of £20,000 invested in Government stock at 4 per cent. on trust for the upkeep and extension of the herbarium and library. This amount will later be increased by an additional sum of £7,000. A further amount of £21,000 is also left to the same College for the foundation of scholarships. It is directed that in the selection of scholars to benefit under this fund regard shall be paid to necessitous circumstances and proof of industry, and not exclusively to ability. Eventually Dr. BOLUS' landed property, on which is situated the house in which he lived and in which he did the greater part of his botanical work, becomes the property of the College, the proceeds to be applied to the purposes previously indicated. This is the largest bequest ever made to an educational institution in South Africa. An obituary notice of Dr. BOLUS was printed in our issue for June 3 last, p. 358.

FLOWER SHOW AT A BANK.—The following communication is sent us by an ardent horticulturist who is intimately connected with the London banking business:—"On the 8th inst. a very interesting flower show was held at the British Linen Bank in Threadneedle Street. A member of the Floral Committee of the R.H.S. acted as judge of Roses and Sweet Peas, the only two classes in which there was competition. He was much surprised that the staff of one bank could stage such numerous well-grown exhibits as those shown. After the prizes (including a silver bowl from the manager) had been awarded, the judge drew attention to the fact that to the best of his knowledge the exhibition was unique, and he sincerely hoped that it would become the starting point for the 'City of London Bankers Horticultural Society.' Seeing that practically the whole staff attended the show, from manager to messengers, and that nearly one half of those present either competed in the two classes or staged some cut flowers ('not for competition') he had no doubt that from this comparatively small beginning great results would follow. Properly organised, such a society should for many reasons meet with support from banking directors and managers, and there is no reason to suppose that other banks do not contain a large percentage of keen gardeners." We trust that the movement which has commenced so auspiciously may so commend itself to those concerned with the management of other banks, that in the near future there may be amateur flower shows in the City that will stimulate the interest already taken in practical gardening.

WORKS ON ROSES.—Messrs. HODGSON & Co. inform us that in their sale of books to be held on the 19th, 20th, and 21st inst., will be included books on Roses and Rose culture, by English, French, and German authors, comprising 73 volumes.

PUBLICATIONS RECEIVED.—*Farm Poultry*, by W. R. Graham, B.S.A. Ontario Department of Agriculture, Ontario Agricultural College, Bulletin 189. (Toronto: L. K. Cameron.)—*Children's Gardens*, by Mrs. Mabel Edwards Webb. (London: Agricultural and Horticultural Association.) Price 1d.

SOCIETIES.

ROYAL HORTICULTURAL OLYMPIA SHOW.

(Concluded from p. 19.)

EXHIBITS OF HORTICULTURAL SUNDRIES.

Messrs. LIBERTY & Co., Regent Street, London, showed a representative collection of their terracotta garden pottery, made of porous clay, with, in many instances, a broken colour effect obtained by using wood fuel when baking the articles. When new, many of the vases have too bright a red colour, but on exposure to the atmosphere these receptacles quickly assume a weather-beaten appearance. The vases were of varied sizes. Long, narrow troughs of a window-box size and shape are well adapted for window gardening, and these receptacles are to be preferred to wooden boxes, which quickly decay and harbour insect pests. Terracotta pillars, to be used as supports for pergolas, of light and graceful designs, had well-flowered cluster Roses trained around them, and many of the vases contained such plants as Hydrangeas, Marguerites, Lilliums, and Palms growing in them.

Messrs. CASTLE, Baltic Wharf, Millbank, exhibited teak wood garden furniture, made from the timber of old warships. There was a very good collection of garden chairs, benches, and tables. These articles of furniture were not stained or varnished, but they were well polished, and therefore impervious to water. The tops of the tables intended to be stood out-of-doors were composed of 1-inch-wide rafts of teak wood, with spaces between them, so that they quickly dry after showers of rain, and many of the chairs were made on the same excellent principle. (Silver Flora Medal.)

Messrs. WM. WOOD & Co., Wood Green, London, N., displayed a varied assortment of garden ornaments in lead and pottery, as well as garden seats and vases. Sundials, mounted on ornamental, but unobtrusive pedestals were placed amongst the vases and seats. The same firm had also a collection of garden sundries, such as watering-pots, syringes, rubber hose, &c. Good samples of Orchid peat and yellow loam were shown, with a tub of "Nidos," their Orchid compost, ready for use. At the back of the stand, Messrs. WOOD had an infinite variety of chemical manures, both in liquid and powder forms. Bamboo sun blinds, boxes, hampers, tying materials, a variety of baskets, and Bamboo canes.

THE LEYTON TIMBER CO., High Road, Leyton, showed an attractive selection of rustic wood-work. It was arranged in the form of an arched trellis-work enclosure, containing several well-designed summer-houses, garden chairs, and tables. The chairs and seats were more comfortable than their appearance suggested, and, after the gloss of the varnish had become dull, they would be in perfect harmony in the garden or along woodland walks.

Messrs. MAGGS & Co., Clifton, Bristol, showed teak seats and tables suitable for placing in the garden or in summer-houses. Plant-tubs and a few jardinières, also made of old man-of-war teak wood, were shown by this firm.

A variety of light ladders and steps were exhibited by the PATENT SAFETY LADDER CO., Peterborough. The ladders were mostly of the extension principle, and were provided with a patent counter-balance, which, as the extension was being elevated, locked on each rung of the ladder; a side rope released the catch, so that the extension might easily be lowered.

Mr. JOHN PINCHES, Crown Buildings, Camberwell, S.E., showed stamped metal labels of many sizes. Bloom protectors, exhibition boxes, complete with tubes and many kinds of flexible metal labels were set out.

Messrs. JULES LANG & SON, Bury Street, St. Mary Axe, London, arranged a very tempting display of various bottled fruits and vegetables, which had been preserved from six to eight years, and appeared as though they would keep fresh and good for a further similar period.

Mr. W. POUPART, Twickenham, Middlesex, staged an exceedingly fine collection of many kinds of bottled fruits, which plainly demonstrated the excellence of his method of preservation. The bottled fruits retained their shape and colour, and appeared very tempting.

Mr. J. HAWS, Clapton, N.E., staged a selection of his well-known watering-pots. Besides his ordinary type of watering-can, this exhibitor showed many novelties, including some with adjustable handles to fix on to the bottom of a can, for use when watering plants on an overhead shelf. Small watering-cans, with spouts bent downwards for watering table plants were shown in attractive colours. Very ornate, small cans, nickel-plated and in brass, intended for use at ceremonial tree-plantings, were also exhibited in this group.

MESSRS. CHAS. KINNELL & Co., Southwark Street, S.E., placed some large tubular boilers, as well as smaller heating apparatus suitable for heating glasshouses. This firm also showed a simplified ventilating gear (Englemann's patent), which is simple in arrangement and easy to work.

THE THAMES BANK IRON CO., Upper Ground Street, S.E., had a variety of full-sized economic boilers.

MESSRS. WM. DUNCAN TUCKER & SONS, 27, Cannon Street, E.C., erected two span-roofed greenhouses. These were light and airy structures, and appeared to be well adapted for growing cool and greenhouse plants. Span frames, with a patent ventilating arrangement, were also shown by these exhibitors.

Mr. JOHN P. WHITE, The Pyghtle Works, Bedford, had a very artistic group of garden furniture. A green, wooden trellis partly enclosed some very choice examples of marble vases, old sun-dials, leaden figures, and vases. A leaden bird's bath, with a layer of gravel in the bottom was a particularly fine piece of work, as also were a pair of old leaden vases.

THE SELBORNE SOCIETY, Brent Valley branch, Hanwell, staged a number of interesting nesting-boxes made from natural logs, suitable for fastening to trees, posts or walls.

Mr. G. SLATTER, Long Row, Nottingham, had on view a useful attachment for the lawn mower, in the form of an adjustable verge cutter. When the grass verges are kept in good order, such a verge-cutter is a great time-saver.

MESSRS. BLAKE & MACKENZIE, Islington, Liverpool, staged waterproof flower-pots. These are made of stiffened paper, and are well adapted for raising seedling plants which do not long remain in the same receptacle. Being light and unbreakable, these pots are admirable for sending small plants by rail or post.

THE PERMANENT PRINTING CO., Holborn, London, had a selection of their new "Ivo" garden label. These labels, which were shown in green and white ivory, may be had in any colour. The names or any advertising matter is printed by the firm with a patent ink, which is impervious to the atmosphere or water. This material is equally well adapted for colour-printing; the company had on show the Royal coat of arms in blue, rose, and gold, beautifully executed.

British-made bell glasses of good-quality glass were staged by Messrs. CHANCE & Co., Halesowen Street, Oldbury. These indispensable adjuncts to present-day gardening were also shown with an arrangement for ventilating at the apex.

Messrs. WM. COOPER & NEPHEWS, Berkhamsted, had an attractive display of their spray fluids. Along the front of their stand were placed dried specimens in glass-lidded boxes, showing the damage caused by various insect and fungous pests.

MESSRS. LAWRENCE, LLOYD & Co., Worship Street, Finsbury, showed the Pennsylvania lawn-mowers and lawn-cleaner.

Messrs. H. PATTISON & Co., Streatham, staged a great variety of horse-boots. Those with special rubber soles would be excellent for use on slopes and in slippery places, the roughened rubber affording a better grip than does smooth leather.

THE ALPHA EXTINGUISHER CO., Ross, Herefordshire, gave many demonstrations in the working of their sprayers and fire extinguishers.

THE FOUR-OAKS SPRAYING CO., Sutton Coldfield, Birmingham, had an extensive collection of their spraying appliances and well-known indelible syringes.

"Abol" syringes and insecticides were staged by Messrs. E. A. WHITE, Paddock Wood, Kent.

Mr. ARTHUR WALDEN, Delamere, Poole, Dorset, explained the advantages of his patent manure-infuser. This is in the form of a finely-perforated, galvanised pail, with a tightly-fitting lid, which contains the organic manure. The cone arrangement in the middle of the pail facilitates the infusion of the water when the pail

of manure is plunged into a cask of water. It is a more expeditious way of making manure water than the old bag method.

Messrs. SANKEY & SONS, of the Royal Potteries, Bulwell, Notts., had an interesting stand of their famous pots and seed-pans. The tiny, thimble-sized pot, so rarely seen by the private gardener, reposed, many dozens, in a square Fern-pan, and pots of every succeeding size, up to large 16-inch receptacles, were exhibited in perfect shape and make. A most comprehensive selection of ornamental pottery pans and vases was shown. The ornamentation was neat and tasteful, Ferns and other plants growing in such pottery may well be placed direct into any dwelling room.

Messrs. J. CRISPIN & SONS, Bristol, erected a small span-roofed glasshouse of the villa conservatory type.

Scientific Committee.

JUNE 20.—*Present*: Mr. J. T. Bennett-Poë, M.A. (in the Chair); Prof. Boulger, Dr. Voelcker, Messrs. R. H. Pearson, J. O'Brien, W. Fawcett, J. Odell, A. Worsley, and F. J. Chittenden (hon. sec.).

Catasetum "Cliftonii."—Mr. JAMES O'BRIEN showed plants under this name from the collections of Sir Trevor Lawrence, Bart., and Sir Jeremiah Colman, Bart., respectively. The flowers presented several minor points of difference in coloration and in the form of the lip, but both had a large callus upon the latter. No essential difference was to be seen in habit. Mr. O'BRIEN considered them to be forms of one species, a view with which Dr. Rendle, to whom they were referred, concurred. Dr. Rendle regarded them as forms of the very variable *Catasetum Bungei*, a Venezuelan species figured in *Bot. Mag.*, tab. 6,998.

Malformed Cattleya.—Mr. O'BRIEN also showed a malformed *Cattleya labiata*, upon which Dr. Rendle commented as follows: "The dorsal sepal has become broad and short, resembling more the lip and petals; the lateral petals have become shorter, resembling the lip in colour, but slightly smaller; they are enclosed by the lip and convolute with each other; the dorsal sepal, with lip and petals, formed a central rosette; the lateral petals are shorter than usual, but otherwise normal. The column is reduced, forming a pillar-like structure bearing an aborted anther."

LINNEAN SOCIETY.

JUNE 15.—Dr. A. B. Rendle, F.R.S., Vice-president, in the chair.

A letter congratulating Sir Joseph Hooker on his approaching 94th birthday was read and signed by the Chairman and the Fellows present.

Mr. W. Fawcett, F.L.S., showed:—

(a) A parasitic flowering plant from Jamaica (*Scybalium jamaicense*, Schott and Endl.).

(b) Flowers of Banana (*Musa paradisiaca* var. *sapientum*).

The cultivated Banana plant attains its full height before the flowers are formed. The trunk is a hollow cylinder formed by the bases of the leaf-stalks. The flowering-stalk first appears as a projection from the tuber into the base of the cylinder. The first flowers are formed while the stalk is quite short, and apparently it takes about six weeks for it to grow from the base until it emerges at the apex. The flowers exhibited were taken before emergence. They occur in clusters spirally arranged round the peduncle. The lowest clusters are female flowers, in which the ovary is two-thirds of the length of the whole flower; the highest clusters are male flowers, in which the ovary is only one-third or even one-fourth of the length of the whole flower. Between these two sets of clusters there are very often a few clusters in which the ovary is about half the length of the whole flower; these are probably not truly hermaphrodite, but neuter. The relative length of the ovary can be easily seen at the earliest stages, when the peduncle is only a few inches high.

The ovaries of the female flowers become the Banana fruit; those of the neuter flowers grow into small, worthless fruit. The male flowers and bracts are deciduous, and the peduncle continues to lengthen and produce male flowers until the fruit is cut.

Mrs. Longstaff showed a specimen of *Brassia udata*, Lindl., in flower, from Jamaica, which

was followed by remarks from Mr. W. Fawcett and the Chairman.

Sir Frank Crisp exhibited, on behalf of Mr. William Morris, a monstrous proliferation of a Foxglove, in which the terminal flower had attained an extraordinary development.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 15.—*Committee Present*: Messrs. E. Ashworth (Chairman), Ward, Cowan, Thorp, Arthur, Sander, Cypher, Keeling, Parker, and Weathers (hon. sec.).

This was the closing meeting of the season, and only a small display of plants was made.

The principal interest centred in the competitions for the past season, the most important of which was the "Charlesworth Cup," a trophy of considerable value, offered for plants not previously certificated by the society. W. R. LEE, Esq., Heywood, who has been a consistent exhibitor, was an easy winner, S. GRATRIX, Esq., being placed 2nd. The "R. Ashworth Cup," offered for general excellence, was won by the same exhibitor, and the "Robson Cup," for *Odontoglossums* and allied genera, was also won by Mr. LEE.

The officers appointed for the season 1911-12 were as follows:—Chairman, Rev. J. Crombleholme; Vice-Chairman, L. A. Ward; treasurer, G. H. Peace; auditor, H. Thorp; secretary, H. Arthur.

WINDSOR AND ETON ROSE.

JUNE 28.—The annual exhibition of this society was held on the foregoing date, in beautiful weather. The general excellence which usually characterises this show was this year not maintained. The exhibits were not so numerous, and the quality of the blooms was below the average. The Rose show at the Crystal Palace, held on the preceding day, no doubt, partly accounted for the falling-off at Windsor.

The King's Challenge Cup, presented by the late King Edward for 48 blooms, distinct, was won by Messrs. R. HARKNESS & Co., Hitchin, with a good stand of fresh flowers, Dean Hole, Florence Pemberton, J. B. Clark, Gustave Piganeau, Mrs. W. J. Grant, Etienne Levet, Lyon Rose, Caroline Testout, and Gladys Harkness being some of the best varieties. 2nd, Messrs. B. R. CANT & SONS, Colchester; 3rd, Messrs. A. DICKSON & SONS, Newtownards.

Messrs. R. B. CANT & SONS led in the class for 18 Teas or Noisettes, having choice blooms of Maman Cochet, Medea, Molly Sharman Crawford, White Maman Cochet, and Mrs. E. Mawley; 2nd, Messrs. D. PRIOR & SON; 3rd, Mr. J. PIGG, Royston.

Messrs. R. HARKNESS & Co. won the 1st prize offered for 12 distinct varieties, three blooms of each, Ulrich Brunner, Lyon Rose, Mildred Grant, Frau Karl Druschki, Mrs. J. Laing, and Mrs. Theodore Roosevelt being especially good. 2nd, Messrs. A. DICKSON & SONS; 3rd, Messrs. D. PRIOR & SONS.

For 12 blooms of any H.T. or H.P. variety, Messrs. ALEX. DICKSON & SONS were a good 1st, showing Mildred Grant finely. 2nd, Messrs. D. PRIOR, with Lady Ashtown; 3rd, Messrs. R. HARKNESS & Co., with Lyon Rose.

Messrs. D. PRIOR & SONS excelled in the class for 12 blooms of any Tea or Noisette variety, with splendid blooms of Mme. Jules Gravereaux. 2nd, Mr. J. PIGG, with Molly Sharman Crawford.

The only exhibit of 18 bunches of decorative Roses, distinct, was shown by Mr. CHARLES TURNER, Slough, but the exhibit was well worthy of the 1st prize that was awarded. Crimson Rambler, Bardou Job, Gardenia, Mme. Ravary, and Lady White were notable varieties shown well in this collection.

For 12 blooms of any crimson and 12 of any white variety, Messrs. G. & W. BURCH, Peterborough, were placed 1st for splendid flowers of J. B. Clark and Frau Karl Druschki. 2nd, Messrs. D. PRIOR & SONS.

AMATEURS' CLASSES.

There were only two competitors for the Windsor Cup, offered for 24 blooms, distinct, and Mr. E. B. LINDSELL won easily, having some very choice blooms. 2nd, Mrs. E. P. STEVENS.

Mr. E. B. LINDSELL also won the Princess Alexis Dolgorouki's Challenge Cup, offered for eight varieties, distinct, three blooms of each variety.

Mrs. W. A. Owston offered a Challenge Cup in the class for 18 blooms, distinct. It was won by Mr. W. ONSLOW TIMES, with excellent specimens of Helen Keller, Dean Hole, J. B. Clark, and Frau Karl Druschki. 2nd, Mr. J. B. FORTESCUE.

Mr. W. L. WITTERN won 1st prizes in the classes for 12 blooms, distinct, and for 12 distinct, open only to growers of not more than 1,000 plants.

Mr. FORTESCUE won the Cup presented by Lady Mary Arkwright in the local classes for 24 blooms, distinct; also the Cup presented by Lady Evelyn Mason for six bunches of decorative Roses. Mr. A. L. COOK, Mr. E. SHACKLE, Mr. J. G. CAREY, Mr. E. CLIFTON BROWN, Rev. H. TOWER, and Mr. F. GOVETT also won prizes in this section.

Mrs. Bevil Fortescue's Cup was won by the Rev. J. B. SHACKLE. The same exhibitor also won the 1st prizes offered for nine Tea or Noisette varieties, showing Mrs. J. Laing; for six blooms of any H.P. or H.T.; and also for six Tea or Noisette Roses.

The class for decorated dinner tables was well contested, Mrs. W. MASLIN having a very tastefully-arranged table of Sweet Peas, Gypsophila, and grasses.

Messrs. HARKNESS & Co. won the National Rose Society's Medal offered for the best Rose in the show with a bloom of Mrs. T. Roosevelt.

The Marchioness of Normandy's Cup, offered for a group of plants, was won by Mr. E. WAGG.

The trade exhibits were not so numerous as usual. Mr. C. TURNER, Slough, showed hardy flowers, Carnations, and Roses; Messrs. J. VEITCH & SONS, LTD., Chelsea, Roses; Messrs. GEO. JACKMAN & SON, hardy flowers; Mr. THOS. TUBB, Farnham Common, Roses; Messrs. FLETCHER BROS., Ottershaw, hardy flowers and Roses; Messrs. TITT & SON, Windsor, floral decorations; and the CLURY NURSERIES, Langley, a collection of Carnations.

SOUTHAMPTON ROYAL HORTICULTURAL.

JUNE 27, 28.—The summer exhibition of this society was held, in splendid weather, on these dates, in the County Cricket Ground, Southampton, which provided an excellent site for the holding of a flower show. The entries were not quite so numerous as in some former years. There was a little falling-off in the entries in the Rose classes, which were the more numerous in the prize list. The blooms staged were not large, but good in quality, and some few showed the effects of the recent hot weather. Miscellaneous plants were interesting, whilst displays of fruits and vegetables were good. The arrangements were well carried out by the secretary, Mr. Fuidge, who has held this office for 40 years.

ROSES.

The leading class for Roses was for 48 blooms, distinct. Three competed, the 1st prize being awarded to Messrs. D. PRIOR & SON, Colchester, for medium-sized, fresh blooms of such varieties as G. C. Waud, White Killarney, Hugh Dickson, Maman Cochet, Florence Pemberton, Lady Ursula, Mrs. John Laing, and Mme. Jules Gravereaux. 2nd, Mr. H. DREW, Longworth, Berkshire, who had slightly smaller blooms.

In the class for 12 triplets, Mr. G. PRINCE, Longworth, Berkshire, was the most successful exhibitor, staging Hugh Dickson, Avoca, J. B. Clark, Mildred Grant, White Maman Cochet, Frau K. Druschki, and Mrs. S. Crawford.

For 12 varieties of Tea or Noisette varieties, Mr. G. PRINCE was placed 1st for choice blooms of Mrs. M. Kennedy, Comtesse de Nadaillac, and Mrs. E. Mawley amongst other varieties.

Mr. H. DREW was successful in the class for six Roses of any one dark variety, having well-coloured blooms of J. B. Clark.

Messrs. D. PRIOR & SON showed the premier exhibit in the class for six Roses of a light-coloured variety, having fine blooms of Frau Karl Druschki.

For a display of decorative Roses, in a space of 7 feet by 3 feet, Mr. ELISHA J. HICKS, Twyford, Berkshire, was placed 1st, with bunches of

desirable kinds pleasingly arranged. Orleans Rose, Jeanne d'Arc, and Mrs. W. Cutbush were noticeable in this exhibit. 2nd, Mr. ERNEST HICKS.

There were numerous classes for gardeners and amateurs. Seven growers competed for the "Munt" Silver Cup, offered for 18 blooms of distinct varieties, but the trophy was won easily by Dr. C. LAMPLUGH, Kirkstall, Alverstoke, with good specimens of Dean Hole, Hugh Dickson, and W. Shean. H. D. BROUGHTON, Esq., Beech Hurst, Andover (gr. Mr. W. C. Gregory), was placed 2nd.

In the class for 12 Tea or Noisette Roses, D. SEATON, Esq., Woodside Cottage, Lymington, was the most successful exhibitor.

Mixed varieties of Roses, arranged in two vases for effect, made a pleasing display. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), won the 1st prize easily with an exhibit in which the Lyon Rose was a conspicuous variety. 2nd, A. J. FORT, Esq., Winchester.

Sweet Peas are an important feature at this exhibition. Messrs. Toogood, Southampton, offered prizes in a class for six bunches. F. G. RADDORE, Esq., Woodfield, Havant (gr. Mr. G. Hoar), won the 1st prize with small, fresh examples of John Ingman, Elsie Herbert, King Edward Spencer, and Evelyn Hemus. 2nd, Mr. BEALING, Bassett, Southampton. But this decision did not meet with general approval.

In Messrs. Sutton & Sons', Messrs. James Carter & Co.'s, and Messrs. E. Webb & Sons' classes, Sir RANDOLPH BAKER, Ranston House, Blandford (gr. Mr. Usher), was quite unassailable in every case, winning the 1st prizes with large, brightly-coloured blooms of such varieties as Mrs. Usher, Mrs. Hugh Dickson, Evelyn Hemus, Othello, Spencer, and Clara Curtis. Mr. H. H. LEES, Warblington Cottage, Havant, was also a prominent exhibitor in these classes, winning several prizes.

FRUIT AND VEGETABLES.

Mr. MYERS (gr. Mr. Ellwood) won the 1st prize easily in the class for two bunches of Black Hamburgh Grapes.

Mrs. UBSDELL, New Milton (gr. Mr. Foskett), showed the best exhibit of white Grapes with bunches of Foster's Seedling.

Mrs. E. S. FARMAN, Downhams, won the 1st prize for one dish of Peaches with extra good fruits of Hale's Early.

Mr. USHER excelled in the class for Nectarines, having small, well-coloured examples.

Strawberries were very fine in quality, and numerously shown. For two dishes of these fruits, L. WALKER MUNRO, Esq., Brockenhurst (gr. Mr. Westron), won the 1st prize with superb examples of Givon's Late Prolific and Bedford Champion.

Exhibits of vegetables were numerous and good, although, perhaps, not quite so numerous as in past years. Messrs. Toogood & Sons offered 10 prizes for 6 dishes. Mr. MYERS easily secured the leading award with high-class examples of Cauliflowers, Tomatos, Potatos, Peas, Carrots, and Onions. 2nd, Admiral Sir J. HOPKINS, Greatbridge House, Romsey (gr. Mr. Mattingley).

Mr. MYERS also won the 1st prize in Messrs. Sutton's class for six dishes of vegetables, and also in Messrs. J. Carter & Co.'s class for the same number of dishes.

NON-COMPETITIVE EXHIBITS added much to the excellence of the show.

Mr. BURNETT, Guernsey, showed Carnations in quantity and of high quality. (Gold Medal.)

Messrs. B. LADHAMS & SON, Shirley, Southampton, arranged hardy herbaceous flowers in an attractive manner. Heucheras, Campanulas, Hemerocallis, perpetual-flowering Pinks, Gailardias, and Scabious were especially good. (Silver-gilt Medal.)

Mr. M. PRICHARD, Christchurch, contributed Kniphofias "Goldelse" and "Rufus," also Delphiniums, including the variety Rev. Lascelles, a very dark blue flower, with a pure white eye. (Silver-gilt Medal.)

Messrs. TOOGOOD & SONS, Southampton, arranged a grand display of Sweet Peas.

Messrs. KELWAY & SON, Langport, showed about 50 spikes of Delphiniums, all of high-class quality. Noticeable varieties were Lovely (mauve and blue), Monarch of All, Royal Blue, Dusky Monarch, Star of Langport, and Lemberg (a very dark purple-violet variety).

RICHMOND HORTICULTURAL.

JUNE 28.—The Richmond Horticultural Society held their 37th exhibition in the Old Deer Park on the above date. This being the date of the Royal Agricultural Society's show at Norwich, and flower shows being also held at the same time so near to Richmond as Walton-on-Thames and Windsor, the show under notice suffered in consequence. Although the exhibits were not so numerous as usual, there was no falling off in quality. Despite the hot, dry season, the displays of Roses, hardy plants, Sweet Peas, and other flowers were remarkably good. A large amount of space was occupied by very fine groups of miscellaneous plants. The fruit and vegetable sections of the exhibition brought together some very meritorious exhibits. A dish of extra large berries of "Waterloo" Strawberries from Mr. BIDDULPH's garden, attracted considerable attention. It is not every garden which is capable of producing good crops of this late Strawberry, but when successfully grown there is no finer or richer-flavoured variety. A novel class was that for the best collection of salads; Mr. LASOCK, who won the 1st prize, arranged a representative collection of fresh, well-grown salading in a very attractive manner. As is so often the case at provincial shows, the vegetables shown by cottagers and allotment-holders were of high merit, and did not suffer by comparison with the exhibits staged by professional gardeners.

In the class for a group of plants, not to exceed 100 square feet, Sir MAX WAECHTER was placed 1st with a fine exhibit containing well-grown plants of Lilliums in variety, Spiræas, Carnations, and well-flowered Orchids; 2nd, Messrs. CARD & DENNY; 3rd, Miss LANGWORTHY, Holyport.

For a semi-circular group of plants, not to exceed 60 square feet, Mr. S. LARKIN secured the 1st prize with a tastefully-arranged exhibit consisting chiefly of tall, graceful Palms and Orchids; 2nd, Mrs. COOPER COLES, Twickenham.

Mr. H. LITTLE, Twickenham, was clearly 1st in the class for six exotic Orchids; his plants included an unusually fine specimen of Lælio-Cattleya Zephyra; 2nd, Mr. S. FIDDLEMAN, Tooting.

The best collection of six exotic Ferns, the best six foliage plants, and the best Aspidistras were shown by Mrs. VAUGHAN-ARBUCKLE, Richmond, but this exhibitor was 2nd to Mr. L. WARDE, Petersham, and Mrs. COOPER COLES in the classes for six Caladiums and six Fuchsias respectively.

Mr. G. ATKINS won the 1st prize for six tuberous-rooted Begonias, whilst Mrs. VAUGHAN-ARBUCKLE was 1st in the class for six Coleus, Mr. L. WARDE being 2nd.

Messrs. F. CANT & Co., Colchester, won the 1st prize for 48 Roses with an exceedingly fine collection of fresh blooms of good substance.

Messrs. G. & W. BURCH were placed 1st for 24 Roses, Mr. H. DREW, Longworth, being 2nd.

Messrs. CRISP & SONS had the best exhibit of 12 Roses, Mr. BURCH being 2nd and Mr. H. DREW 3rd; whilst for 12 Roses of one variety, Mr. H. DREW won the 1st prize and Messrs. F. CANT the 2nd.

HONORARY EXHIBITS.

Mr. L. R. RUSSELL, Richmond Nurseries, arranged a series of groups of stove and greenhouse plants and trees and shrubs. The outstanding plants were Codiaums (Crotons), particularly C. caudatus tortilis, Caladiums Silver Cloud and John R. Box, and little beds of Nertera depressa, which Mr. RUSSELL grows so extraordinarily well. (Large Gold Medal.)

Mr. W. THOMPSON, Sheen Nurseries, was awarded a Silver-gilt Medal for a large group of plants.

Mr. A. C. HATCH, East Twickenham, displayed an uncommonly good group of Cacti, the plants being chiefly in flower.

Besides the two medals for groups of plants, others were awarded to Messrs. H. ECKFORD for Sweet Peas; Messrs. FROMOW & SONS, Chiswick, for Japanese Maples, and Mr. H. E. FORDHAM for a group of plants. The Gunnersbury Challenge Cup for Roses was won by Messrs. F. CANT & Co., and the Waechter Cup for fruit was awarded to Sir W. GREENWELL, Caterham.

REIGATE ROSE AND SWEET PEA.

JULY 1.—The 6th annual show of the Reigate Rose and Sweet Pea Association was held on the above date, in the grounds at The Barons, Reigate, the residence of Mr. E. H. Johnstone. The exhibition was much larger than the one held last year, and favourable weather added to the success of the show, which, on the last occasion, was spoiled by a continuous downpour of rain.

Competition was keenest in the Sweet Pea classes, in which some excellent bunches were staged. Eleven competitors staged in the class for 12 bunches, and there were 13 collections in the class for 6 bunches of these flowers. The decorative classes for table decorations proved a great attraction, there being nine tables arranged with Sweet Peas and six with Roses. The challenge cup offered in the former class was awarded for a mixed arrangement of mauve, pink, and cream coloured Sweet Peas, with Sweet Pea foliage. The Challenge Bowl offered for Roses was given for an arrangement of Mme. Abel Chatenay, with foliage of Rosa rubrifolia and Asparagus.

In the nurserymen's classes for exhibition Roses, Messrs. B. R. CANT & SONS, Colchester, won the Challenge Cup offered for 48 blooms, Messrs. D. PRIOR & SONS being placed 2nd, and Messrs. FRANK CANT & Co., Colchester, 3rd.

Mr. H. DREW, Oxford, was placed 1st in the class for 24 blooms of Roses, and also in that for 18 Tea or Noisette varieties.

Twelve bunches of garden Roses made a good class, Messrs. FRANK CANT & Co. winning the 1st prize with a group which included some especially good blooms of Rouge Angevine, Lady Curzon, and Gardenia.

The Rose classes for amateurs were grouped in three divisions, those growing fewer than 300 plants, those with fewer than 1,000, and the open classes. In the open classes, Mr. A. TATE won the 1st prizes in the classes for 24 varieties, and for 3 blooms each of 8 varieties. Mr. W. R. HAMMOND was placed 1st in the class for 18 blooms, and Mr. E. M. EVERSFIELD in that for 12 Tea or Noisette varieties. The Silver Medal offered for the best bloom was won by Mr. E. B. LEHMANN, with the variety Avoca.

SCOTTISH HORTICULTURAL.

JULY 4.—The monthly meeting of the above association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. Massie, the president, occupied the chair, and there was an attendance of 65 members.

Under the title of "Some Recent Additions to Our Knowledge of Trees," the secretary gave an account of the experiments in the breeding of Elms, which Dr. HENRY, of Cambridge University, had recently carried out (an abstract of which appeared in the *Gardeners' Chronicle* of April 23 and 30, 1910), and this he illustrated by means of a series of lantern slides. A discussion followed.

The exhibits included an exhibit of Roses, shown by Messrs. DICKSON & Co., Edinburgh; Begonia flowers and Potato Midlothian Early (the produce of two plants weighing 10 lbs.), from Miss BURTON, Polton; fruit of Stephanotis floribunda, shown by Messrs. JOHN FORBES, LTD., Hawick; flowers of Carnation Lady Hermione, exhibited by Messrs. TODD & Co., Edinburgh; seedling Ox-eye Daisies (*Chrysanthemum Leucanthemum*), shown by Mr. F. BAILLIE, Stenhouse, Liberton; a new Strawberry, named The Liberal, and Essex Star Pea, exhibited by Mr. JAMES SCARLETT, Sweethope, Musselburgh; Marguerite Mrs. F. Sander, and hybrid Passion flower, from Messrs. JAMES GRIEVE & SONS, Edinburgh; a plant of Rhododendron grown in a dwelling-room window in Edinburgh for eight years, but now nearly suppressed by a plant of the common Heather (*Calluna*), which appeared as a seedling in the soil in which the Rhododendron was repotted eight years ago, exhibited by Mr. A. MACMILLAN, Edinburgh (late of Trinity Cottage); and Lathyrus rotundifolius (*Drummondii*), shown by the SECRETARY.

At the meeting to be held on August 1 a paper will be read on "Perpetual-flowering Carnations," by Mr. THOS. HAY, superintendent of Greenwich Park (late of Hopetoun).

The arrangements for the excursion to Manderston on August 19 were announced.

HANLEY HORTICULTURAL FÊTE.

JULY 5, 6.—The 15th annual horticultural fête was held in the Hanley Park, situated in the world-renowned Staffordshire Potteries, on the above dates. The entries appeared to be well up to the average, and competition was keen in nearly all the classes.

The show was well supported by visitors on the opening day, and without attempting to particularise too closely, mention must be made of the remarkably well-grown and handsome collections of fruit exhibited by J. DRAKE, Esq., Orford House, Market Rasen, and by the Duke of WESTMINSTER, Eaton Hall, Chester. The artistically-arranged plant groups found many admirers.

PLANTS (OPEN).

The group class is always a good feature at Hanley, and the high standard of excellence was well maintained on the present occasion. Each of the five exhibitors occupied spaces of 300 square feet down the centre of the largest marquee, and plants in or out of bloom were permissible. Five prizes were offered, and the first three were awarded as follow:—1st, Messrs. J. CYPHER & SONS, Cheltenham; 2nd, Mr. W. A. HOLMES, Chesterfield; 3rd, Mr. W. R. MANNING, Dudley. The first four groups were constructed on practically the same principle, each one having a central bridge or arch on which were choice foliage and flowering plants surmounted by a tall Palm.

Richness of foliage and flower and artistic arrangement were the characteristic features of Messrs. CYPHER's group. The corner mounds were clothed with exceedingly well-coloured Codiaums, Dracenas, Kalanchoes, and Cattleyas. In the intervening spaces Orchids, Clerodendron fallax, Kalanchoë flammula, Lilioms, Ixoras, and graceful specimens of Humea elegans over a groundwork of Aralias, Ferns, Caladiums, Alocasias, Marantas, and Strobilanthes Dyerianus were employed with good taste. The 2nd prize group was meritorious, but the general effect was rather marred by the inclusion of two tall pillar Roses Hiawatha. In the 3rd prize collection Cattleyas, Odontoglossums, Phalenopsis, Thunias and Lilioms were very effective.

Messrs. CYPHER & SONS won the 1st prize in the next class for Orchids arranged, for effect on table space of 100 square feet. Ferns and foliage plants were allowed. In this group we noted excellent plants of Cattleya Gaskelliana, Vanda cœrulea, Oncidium Pescatorei, Epidendrum prismatocarpum, Disa grandiflora, Lælio-Cattleya calistoglossa, L.-C. Canhamiana gigantea, Bulbophyllum Lobbi, and Oncidium.

In another class for eight Orchids, distinct, Messrs. CYPHER were again to the fore. They had splendid specimens of Vanda cœrulea, Phalenopsis Rimestadiana, Cattleya gigas, Odontoglossum perculum, Lælio-Cattleya Canhamiana magnifica, and Epidendrum prismatocarpum.

In a class reserved for "Malmaison" and other Carnations, the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), was the only competitor. The plants showed excellent culture, and the 1st prize was well deserved.

Messrs. CYPHER again took the lead in a class for six plants in flower (Orchids excluded). They had beautiful specimens of Ixora Williamsii, I. Shawii, Allamanda nobilis, Bougainvillea glabra, Erica Cavendishiana, and Statice intermedia; 2nd, Mr. W. VAUSE.

Messrs. CYPHER & SONS were also awarded 1st prizes for (1) six foliage plants, (2) six Palms, and (3) six fine foliage plants.

A. H. MADDOCK, Esq., The Cedars, Alsager (gr. Mr. B. Smith), was successful in a class for 12 Caladiums. The plants were of medium size and well coloured.

There were five good entries in a class provided for a dozen table plants grown in pots not exceeding 6 inches. The 1st prize was gained by G. J. CROSBIE-DAWSON, Esq., May Place, Newcastle (gr. Mr. J. L. Wells), who showed nine narrow-leaved, richly-coloured Codiaums, one Dracena, one Aralia, and one indifferently-coloured Pandanus Veitchii; 2nd, Mrs. MEAKIN, Darlaston Hall, Stone (gr. Mr. G. F. Goodill).

PLANTS (AMATEURS).

The 1st prize in the leading group class was won by A. H. MADDOCK, Esq., Alsager (gr. Mr. B. Smith), who had very well-grown foliage and flowering plants in great variety nicely arranged. In the 2nd prize group, which came from Mrs. SWANN, Halston Hall, Oswestry (gr. Mr. C.

Roberts), yellow-leaved Codiaums were rather overdone. The 3rd award went to Mrs. MEAKIN, Darlaston Hall (gr. Mr. G. F. Goodill), who secured 1st prizes in classes for (1) six specimen stove or greenhouse plants, and (2) six Begonias.

G. J. CROSBIE-DAWSON, Esq., Newcastle (gr. Mr. J. L. Wells), took the lead in a class for six exotic Ferns, and F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H. S. Foster), had the best 12 table plants grown in 5-inch pots.

ROSES (OPEN).

Roses were extensively shown, but the quality was not equal to that of a year ago. On the present occasion many blooms lacked size and substance, and the oppressive heat of the tent in which they were exhibited had a disastrous effect upon them.

There were five exhibits in the leading class, which was for 72 blooms, distinct. The 1st prize of £10 was won by Messrs. HARKNESS & Co., Hitchin, whose best flowers were Duke of Wellington, Mrs. Stuart Clark, Earl of Dufferin, Lyon Rose, Mrs. Myles Kennedy, J. B. Clark, Madame M. Soupert, Mrs. Theodore Roosevelt, and Her Majesty. Messrs. ALEX. DICKSON & SONS, Newtownards, who were placed 2nd, showed even-sized blooms of Hugh Dickson, Mamie, Duc de Rohan, Her Majesty, and Mildred Grant.

The last-named exhibitors were placed 1st in the next class which was for 48 blooms, distinct. 2nd, Mr. W. H. FRETtingham, Nottingham.

In a class for 36 varieties, three blooms of each, Messrs. HARKNESS & Co. were awarded 1st prize. They had the following varieties in good condition: Hugh Dickson, White Maman Cochet, Mrs. W. J. Grant, Mrs. Stuart Clark, and Mrs. John Laing. 2nd, Messrs. ALEX. DICKSON & SONS.

The best 12 varieties, distinct, introduced during the years 1909-10-11 came from Messrs. ALEX. DICKSON & SONS. The varieties exhibited were: Jonkheer J. L. Mock, Lady Barham, Otto Von Bismarck, Ethel Malcolm, George Reimers, Mrs. Cornwallis West, La Galissiere, Mrs. Foley Hobbs, Duchess of Westminster, Mabel Drew, Bertha Gaulis, and Nita Weldon. 2nd, Messrs. HARKNESS & Co. 3rd, Messrs. PERKINS & SONS, Coventry.

Messrs. ALEX. DICKSON & SONS won 1st prizes in classes for (1) 24 Hybrid Teas, distinct varieties, (2) 24 Tea or Noisette varieties, and (3) 12 white Roses (one variety).

The Lyon Rose exhibited by W. T. MATTOCK, Oxford, was the best yellow flowered Rose. Out of eight competitors Mr. W. H. FRETtingham led in a class for 12 pink-flowered Roses, with Mrs. John Laing in good condition. The best red or crimson variety was Hugh Dickson, shown by KING'S ACRE NURSERIES, Hereford.

In a class provided for dinner tables, 8 feet by 4 feet, decorated with Roses, there were seven exhibits. The 1st prize of £4 was secured by Mr. W. T. MATTOCK, Oxford.

MISCELLANEOUS CUT FLOWERS.

There were five splendid exhibits in a class for a collection of hardy perennials (shrubs, annuals, duplicate or mixed bunches not allowed) arranged on a table space (four tiers) of 16 feet by 4 feet. The 1st prize was awarded to Messrs. HARKNESS & Co., Leeming Bar, Bedale, who had excellent bunches of Gaillardias, Lilioms, Heucheras, Campanulas, Galegas, Iceland Poppies, Delphiniums, &c. 2nd, Messrs. G. GIBSON & Co., Bedale.

Owing to a misinterpretation in the reading of the schedule, Messrs. W. ARTINDALE & SON, Sheffield, were disqualified for including three coloured forms of Alstroemeria chilensis in one bunch in their exhibit. This was a matter for regret, because the collection was a meritorious one, and in the opinion of the judges was the best of the set. A special prize was awarded to Messrs. ARTINDALE for their splendid exhibit.

Messrs. LEWIS & SPROSON, Stoke-on-Trent, were awarded the 1st prize of £15 for floral designs arranged on a space of 15 feet by 6 feet.

In a class reserved for dinner tables, 8 feet by 4 feet, decorated with flowers (Roses excluded) there were eight entries. Plants in pots were allowed. The 1st prize was won by Mr. A. J. BLAIR, Beech Hill, Cheddleton, whose table was pleasingly decorated with pink Carnations relieved with sprays of Gypsophila, Codiaum leaves, and Asparagus. 2nd, Messrs. LEWIS & SPROSON.

FRUIT AND VEGETABLES.

The principal class in this section was one for a dessert table, 10 feet by 4 feet 6 inches, decorated with flowers and foliage (Orchids excluded). Not more than 14 dishes of fruit were allowed. The 1st prize was won by J. DRAKE, Esq., Orford House, Market Rasen (gr. Mr. W. Parker), whose collection was of a very high order of merit. It included Taunton Hero and Countess Melons; Lord Napier and Newton Nectarines; Dr. Hogg and Royal George Peaches; Lady Sudeley and Beauty of Bath Apples; Brown Turkey Fig; Leader Strawberry; and Muscat of Alexandria, Madresfield Court, Black Hamburgh, and Buckland Sweetwater Grapes. The decorations consisted of Carnations, Francoas, Heucheras, and Sweet Peas. The 2nd prize was gained by the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), who had good dishes of Royal George and Prince of Wales Peaches; Golden Gage Plum; and Black Hamburgh Grapes. The decorations were a very pretty combination of pink Carnations and white Francoas. 3rd, Lady BEAUMONT, Carlton Towers, Yorks. (gr. Mr. W. Nicholls).

Collection of 12 dishes.—In this class not fewer than eight kinds were required, and not more than two varieties of a kind. Black and white Grapes (two bunches of each) were to be included and arranged on separate tables, measuring 6 feet by 4 feet. As in the last class floral decorations were allowed, but prizes for these were awarded separately. There were four exhibits, and the best of these came from the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes), who had unusually good specimens of Elruge and Lord Napier Nectarines, Transparent Gage Plum, Royal George Peach, Worcester Pearmain and Lady Sudeley Apples, Williams' Bon Chretien Pear, Eaton Seedling Melon, Foster's Seedling, Muscat of Alexandria, Madresfield Court, and Black Hamburgh Grapes. This exhibitor was awarded the 2nd prize for the floral decorations. J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker), who secured the 2nd prize, showed grand dishes of Lady Sudeley Apple, Leader Strawberry, Taunton Hero Melon, Muscat of Alexandria and Black Hamburgh Grapes. The 3rd award fell to the Earl of HARRINGTON (gr. Mr. J. H. Goodacre), who was placed 1st for decorations, which consisted entirely of Odontoglossums, Cattleyas and Asparagus.

Only two exhibits were placed before the judges in a smaller class for six dishes, distinct kinds. 1st, Lord BAGOT, Blithfield Hall, Rugeley (gr. Mr. T. Bannerman), who showed Black Hamburgh Grapes, Royal George Peach, Downton Nectarine and Brown Turkey Fig, in splendid condition. 2nd, Mr. N. BUXTON, Gedling.

In a class for four bunches of Grapes (two black and two white), the Duke of WESTMINSTER (gr. Mr. N. F. Barnes) was placed 1st, with large, handsome well-berried bunches of Muscat of Alexandria and Madresfield Court. 2nd, the Earl of HARRINGTON (gr. Mr. J. H. Goodacre). The winning pair of bunches of Black Hamburgh Grapes were shown by the last-named exhibitor. Mr. N. F. BARNES was a very good 2nd.

In a class for two bunches of black Grapes (Black Hamburgh excluded) there were five splendid entries. 1st, Lady BEAUMONT (gr. Mr. W. Nicholls) for large, well-finished bunches of Madresfield Court. Mr. N. F. BARNES was awarded the 2nd prize for his handsome bunches of Gros Maroc.

J. DRAKE, Esq. (gr. Mr. W. Nicholls) won first prizes in classes provided for (1) two bunches of White Muscat Grapes and (2) two bunches of any white Grapes (Muscats excluded). The Duke of WESTMINSTER was placed 2nd in each class.

Lord BAGOT showed the best dish of six Peaches. The variety exhibited was Royal George. 2nd, Lady BEAUMONT (gr. Mr. W. Nicholls).

The last-named exhibitor led in the class for six Nectarines, showing large, well-coloured fruits of Lord Napier.

The two best dishes of Nectarines, as well as the winning dish of Figs, came from Lord BAGOT. F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H. S. Foster) showed the best dish of Strawberries.

Messrs. Sutton & Sons offered prizes for six distinct kinds of vegetables, and of the four exhibits the one from Lady BEAUMONT (gr. Mr. W. Nicholls) was awarded the 1st prize. 2nd, F. T. MUNTZ, Esq. (gr. Mr. H. S. Foster).

Messrs. Webb & Sons also offered prizes for six distinct kinds. 1st, F. E. MUNTZ, Esq. (gr. Mr. H. S. Foster). 2nd, Lady BEAUMONT (gr. Mr. W. Nicholls).

The Society's class was for nine distinct kinds, and there were seven good entries. 1st, Lady BEAUMONT (gr. Mr. W. Nicholls). 2nd, F. E. MUNTZ, Esq. (gr. Mr. H. S. Foster).

HONORARY EXHIBITS.

A special award of a Silver Challenge Cup, value £10 10s., and a Gold Medal, offered for the best trade exhibit, was won by Messrs SUTTON & SONS, Reading, for an extensive display of choice fruit, flowers and vegetables.

Messrs. ALDERSEY & MARSDEN, Tilston, Malpas, showed 60 varieties of Sweet Peas, together with cut sprays of hardy shrubs and hardy herbaceous flowers. (Silver Medal.)

Mr. WILLIAM LOWE, Beeston, occupied 40 feet length of staging, on which was displayed about 200 varieties of cut Roses. (Gold Medal.)

Messrs. DICKSONS, Chester, had Roses and hardy herbaceous flowers in great variety. (Silver Medal.)

Mr. R. BOLTON, Warton, Carnforth, contributed a large collection of Sweet Peas. (Gold Medal.)

Mr. H. N. ELLISON, West Bromwich, showed Ferns and clipped shrubs. (Gold Medal.)

Messrs. W. ARTINDALE & SON, Sheffield, occupied space 130 feet long by 4 feet wide with a comprehensive exhibit of hardy herbaceous flowers, Roses, bog and aquatic plants. (Gold Medal.)

Mr. H. ECKFORD, Wem, showed Sweet Peas. (Silver Medal.)

Messrs. JARMAN & Co., Chard, contributed Centaureas, Zonal Pelargoniums, Carnations and Roses. (Silver Medal.)

Messrs. SEAGRAVE & Co., Sheffield, Mr. W. H. PATTISON, Shrewsbury, and Mr. S. R. COMPSON, Macclesfield, sent Violas. (Silver Medals.)

NATIONAL ROSE.

SUMMER EXHIBITION.

JULY 7.—The 35th summer exhibition of this Society was held on the above date in the Botanic Gardens, Regent's Park. The exhibition was held in a large canvas roofed building, having an area of nearly 30,000 square feet. It accommodated 20 tables, each 140 feet long and 3 feet broad, and ample room was allowed between the tables for the inspection of the exhibits. The exhibition was one of the largest and most important Rose shows ever held; the entries numbered more than 1,000, whilst the Roses were of good quality, if rather small; the weather was very hot, but this only seemed to cause a larger attendance than usual.

The advantages of a large building were apparent soon in the day, for the blooms in an adjoining tent began to wither, whilst those in the principal building continued to withstand the great heat surprisingly well. It was instructive to note the development of the flowers; the bud of the morning was a fully-opened Rose at noon, by which time the blooms which were perfect when staged had become full-blown. The successful exhibitors were those who had anticipated this, and had selected their blooms accordingly. Fine blooms of Lyon Rose were staged in great numbers. At the same time some of the older favourites held their own, and we frequently noted such varieties as Her Majesty, A. K. Williams, and Niphetos (immense blooms) in the winning stands. That difficult Rose Bessie Brown was also splendidly shown. The new varieties were again placed in a special tent, and attracted an immense number of visitors. Two new varieties, both H.T.s, shown by Mr. HUGH DICKSON, Belfast, received the Society's Gold Medal, two other new Roses were awarded Silver-gilt Medals, and six obtained Cards of Commendation. Much of the success of the exhibition is due to the hard-working, ever-courteous secretary, Mr. Edward Mawley, and his assistants.

NURSERYMEN'S CLASSES.

The winner of the Challenge Trophy in the premier class for nurserymen, which requires 72 blooms of distinct varieties, may very properly be termed the champion Rose grower of the year. On this occasion the winner was Mr. HUGH DICKSON, Belfast, Messrs. A. DICKSON & SONS, LTD., Newtownards, Ireland, who were the winners last year, being a close 2nd. The premier exhibit contained immense, well-coloured blooms of fine form. Varieties that were particularly noticeable included Mrs. Stewart Clark, which also received the Silver Medal offered for the best Tea Rose in the show, Leslie Holland (of a rich colour), Suzanne Marie Rodocanachi, Mrs. Geo. Preston, King George V. (a dark and velvety bloom), Jonkheer, J. L. Mock, Chas. K. Douglas, Queen of Spain (an almost perfect bloom of pale, flesh-pink colour), and Gustave Piganeau. The best blooms in the 2nd prize group were Mrs. G. W. Kershaw, Geo. Dickson, Chas. Darwin, Caroline Testout, Conway Jones, Duchess of Westminster, Rev. G. Henslow, and Earl Warwick; 3rd, Messrs. R. HARKNESS & Co., Hitchin; 4th, Messrs. D. PRIOR & SON, Colchester.

The class for 40 distinct varieties of Roses, three blooms of each variety, presented a wonderful sight; each exhibitor had to stage five boxes of Roses each containing 24 blooms. The whole of this immense collection was of a surprising degree of excellence, and it became a matter of difficulty to select particular blooms for notice. The chief award was given to Messrs. B. R. CANT & SONS, Colchester, who last year won the 2nd prize in this class. The blooms which attracted us most were Her Majesty (as fine as we have ever seen this grand variety), O. Terks, Mildred, Dean Hole, Ulrich Brunner, Earl of Warwick, and Avoca. 2nd, Messrs. R. HARKNESS & Co., whose example of Hugh Dickson was awarded the Silver Medal offered for the best H.P. bloom in the show. Others of outstanding merit were Claudius, Mildred Grant, Yvonne Vacherot, Duchesse de Morny, Alfred Colomb, and Lady Moyra Beauclerc. 3rd, Messrs. A. DICKSON & SONS.

The China Trophy for 48 blooms, distinct, also attracted very keen competition, and some splendid Roses were shown. Mr. G. PRINCE, Longworth, Faringdon, was awarded the 1st prize for a fine collection of rich blooms, such as Lady Moyra Beauclerc, White Maman Cochet, Avoca, Ulrich Brunner (an immense bloom), and His Majesty. 2nd, Mr. W. H. FRETtingham, Beeston Nurseries, Nottingham, with slightly smaller blooms, Mrs. J. Laing, Charles Lefebvre, and Bessie Brown being the best. 3rd, Messrs. G. & W. H. BURCH, the Rose Nurseries, Peterborough. 4th, Messrs. J. BURRELL, Cambridge.

In the class for 24 blooms, distinct, Mr. W. R. CHAPLIN, Waltham Cross, received the 1st prize for an exceedingly good exhibit. His best blooms were of such standard varieties as Her Majesty, J. B. Clark, and A. K. Williams. 2nd, Mr. E. J. HICKS, Twyford. 3rd, Mr. JOHN MATTOCK, Headington, Oxford.

The class requiring six distinct varieties in triplets resulted in a superb competition, and contained the finest blooms in the show. The 1st prize collection, shown by Mr. HUGH DICKSON, was especially fine. We noted Hugh Dickson, Countess of Caledon, Mrs. David McKee, Mrs. Hugh Dickson, Caroline Testout, Leslie Holland, William Shean, and Mrs. Stewart Clark, all immense blooms of perfect form and colouring. 2nd, Messrs. G. & W. H. BURCH. 3rd, Messrs. PERKINS & SONS, Coventry.

TEA AND NOISETTE ROSES.

Here again the Roses shown were excellent and the competition good, last year's winners being again placed in the same order. The D'Ombrain Cup, offered for 24 blooms, distinct, was awarded to Mr. G. PRINCE, whose best blooms were Comtesse de Nadaillac, Madame Jean Dupuy, Innocente Pirola, Bridesmaid, and Souvenir de Pierre Notting. 2nd, Mr. HENRY DREW, Longworth, Faringdon, whose stand contained an immense flower of the variety Niphetos. 3rd, Messrs. B. R. CANT & SONS, Colchester.

Messrs. CHAPMAN & COLLIN, Leicester, were placed 1st for 12 blooms, distinct; Messrs. J. JEFFRIES & SON, Cirencester, being 2nd; and Messrs. W. & J. BROWN, Witham, 3rd.

The class for 16 distinct varieties, shown as triplets, furnished a much better display than

the previous one. Mr. G. PRINCE led easily with two stands of excellent blooms, the best of which, Madame Jules Gravereaux, received the Silver Medal offered for the best Tea Rose shown by a nurseryman. 2nd, Mr. HY. DREW. 3rd, Messrs. W. CRISP & SONS, West Bergholt, Colchester.

The President's prize, offered for nine baskets of cut blooms of perpetual flowering Roses, was awarded to Mr. EASTLEA, Eastwood, Essex, for an excellent contribution. 2nd, Mr. J. MATTOCK.

In the class for five baskets of Roses, Messrs. HUGH DICKSON excelled easily.

VASE CLASSES.

These furnished exhibits of greater attraction than the preceding classes. The leading vases were nicely arranged, and the seven blooms required for each of the 18 vases are sufficient to make a good display. Messrs. J. JEFFRIES & SONS, Cirencester, were awarded the 1st prize, having splendid vases of Aaron Ward, General M'Arthur, and Elizabeth Barnes. 2nd, Mr. J. BARROW, Oadby, Leicester.

The 1st prize in the smaller class for nine vases was won by Mr. CHAS. TURNER, Slough. 2nd, Messrs. W. SPOONER & SON, Woking.

There was a new class for 16 distinct varieties of 24 blooms arranged in lines in regulation boxes. Mr. E. J. HICKS, Twyford, Berkshire, was easily 1st with a fine set of blooms.

DECORATIVE ROSES.

The "A. C. Turner" Cup is offered for the best collection of 36 distinct varieties, not fewer than three nor more than 12 trusses of each variety. Winning this 1st prize constitutes the Championship amongst nurserymen for this class of Roses. Mr. J. MATTOCK, Oxford, was awarded the Cup for a splendid collection of such decorative varieties as Irish Elegance, Irish Glory, Marquise de Sinety, Nerarajah, Mr. A. Tate, and Lady Curzon; 2nd, Mr. GEO. PRINCE; 3rd, Messrs. G. PAUL & SONS.

In similar classes of smaller numbers, Messrs. W. SPOONER (twice), Mr. GEO. PRINCE, and Mr. J. PIGG, Royston, Herts, for new Roses, won 1st prizes.

Messrs. F. CANT & Co., Colchester, were awarded the 1st prize for Wichuraiana Roses.

GROUPS OF ROSES.

The schedule permits the use of any kind of Rose in these classes, either as growing plants or cut flowers, but the latter must not be displayed in exhibition boxes. As usual Messrs. G. PAUL & SONS, Cheshunt, and Messrs. HOBBIES, LTD., Dereham, Norfolk, were the only exhibitors, and they were awarded the 1st and 2nd prizes in the order named. The groups were beautifully arranged, the methods in each case being very similar; pillar varieties were extensively employed, Rubin, American Pillar, Delight, and Père Andre in the winning exhibit were very fine. Other good Roses were Rev. A. Cheales, Butterfly (a seedling), Pharisæer, George Laing Paul, Frau Karl Druschki (a few widely-expanded blooms of this variety showing their stamens were very charming), Capt. Hayward, and Liberty. In Messrs. HOBBIES' group the variety Juliet attracted much attention; the visitors who sought for perfume were rewarded, for this novelty is sweetly scented. Le Progrès, Duchess of Wellington, Harry Kirk, and a mass of the Lyon Rose were very good in this exhibit.

The groups of Roses arranged on staging measuring 100 square feet were very imposing. In this class the Gold Medal was awarded to Messrs. W. & J. BROWN, Peterborough, for a magnificent collection. Tall pillars of cluster Roses towered up towards the roof of the building, and bold masses of tastefully-arranged show blooms filled the space allowed. This group contained the best blooms of Lyon Rose in the show. Tall stands furnished with Hugh Dickson, Legion d'Honneur, and C. J. Faure were very fine; 2nd, Mr. F. H. BRADLEY, Peterborough. This was another charming display, lightly and prettily arranged. Long sprays of cluster Roses were trained against a wooden trellis at the back, and well-arranged Bamboo stands filled with Roses were placed along the centre of the group. 3rd, Mr. J. MATTOCK, Oxford.

OPEN CLASSES.

In the colour classes open to amateurs and nurserymen alike, the finest crimson Rose was again J. B. Clark, but this year shown by Mr.

BENTLEY, the Rose Nurseries, Leicester; the best white or yellow Rose was *Lyon Rose*, shown by Messrs. **McGREY & SON**, Portadown, Ireland, but the petals seemed far away from any yellow shade of colour. The finest Rose of any other shade than those mentioned was the variety *Theodore Roosevelt*, shown by Mr. **W. BENTLEY**. In these classes the competition was very keen.

The best nine blooms of a new Rose were shown by Mr. **HUGH DICKSON**, and Messrs. **ALEX. DICKSON** were awarded the 1st prize for the best 12 blooms of new Roses.

AMATEUR'S CLASSES.

As in the classes for trade growers the competition amongst amateurs was very keen, and many excellent blooms were staged. The 1st prize in the champion class for 36 blooms, distinct, open to amateurs of every degree, was won by **E. B. LINDSELL**, Esq., Hitchin, who was also the winner last year. Especially fine in a very meritorious stand were *Comtesse de Naidallac* and *Dean Hole*. 2nd, **A. TATE**, Esq., Leatherhead. 3rd, **W. BOYES**, Esq., Driffield, Yorkshire.

Mr. **LINDSELL** also repeated his success of last year in the class for 24 blooms, distinct, with a well-nigh perfect stand of flowers; 2nd, **J. PARK**, Esq., Aiskers Mill, Bedale; 3rd, **F. DENNISON**, Esq., Leamington.

In the classes for growers of fewer than 3,000 plants, the "Hobbies" Cup was offered for 24 blooms, distinct. It was won by Mr. **H. R. DARLINGTON**, Potters Bar, with a fine stand of blooms; 2nd, Mr. **E. M. EVERSFIELD**, Horsham.

The Christy Cup was offered in competition to growers of fewer than 2,000 plants for 24 blooms, distinct. It was awarded to Mr. **W. O. TIMES**, Hitchin; 2nd, Mr. **D. H. H. CHURCH**, Warlingham.

There were also competitions for growers of fewer than 1,000 and 750 plants. The 1st prizes for 12 blooms, distinct, in these classes were won by Mr. **COURTNEY PAGE**, Enfield, and Rev. **L. C. HUNT**, William Rectory, Hitchin, respectively.

The Challenge Cup, offered for the best six blooms, distinct, grown in the metropolitan area, was won by Mr. **W. E. MARTIN**, North Finchley, whilst the piece of plate offered for 18 varieties of decorative Roses was awarded to Mr. **A. TATE**, Leatherhead.

DECORATIVE CLASSES.

A tent was set apart for the classes devoted to the decoration of dinner tables, single vases, &c., by ladies. This was a very interesting feature of the show, and many of the arrangements were very tasteful. Miss **F. MOLYNEUX**, Swanmore Farm, Bishop's Waltham, again won the 1st prize in the class for a dinner-table decoration of Roses, having a very charming combination of *Lyon Rose* and *Irish Elegance*.

GOLD MEDAL ROSES.

The Society's Gold Medal was awarded to the following new Roses:—

Mrs. Sam Ross.—A deep saffron-yellow hybrid Tea Rose, which stands up well on stout stalks and possesses good, healthy foliage. Shown by Mr. **HUGH DICKSON**.

Mrs. R. Draper.—A splendid Rose, which may best be described as a glorified *La France*. Shown by Mr. **HUGH DICKSON**.

Silver-gilt Medals were awarded to the following:—

Souvenir of Portland Oregon, a rich red H.T. Rose, sweetly scented, and well furnished with good stalks and healthy foliage, shown by Mr. **HUGH DICKSON**; *Dandæ*, a perpetual flowering yellow cluster Rose. A bunch of this Rose was included in the basket presented by the Society to Queen Mary (see fig. 192, p. 425, vol. xlix.), shown by Rev. **J. H. PEMBERTON**.

Cards of Commendation were awarded to the following:—

Sunburst.—An apricot-shaded Rose with extra long stems. A two-year-old plant also shown indicated that the plant is liable to mildew. Shown by Mr. **G. BECKWITH**. *Coronation*.—A soft pink coloured H.P. Rose reminiscent of *Her Majesty*. Shown by Mr. **HUGH DICKSON**. *Ethel*.—A hybrid *Wichuraiana* Rose of a pleasing shade of pink fading to nearly white in the "eye." From Mr. **CHAS. TURNER**, Slough. *Mrs. Muir Macbean*.—A brightly-coloured H.T. Rose, which, unfortunately, has no perfume. Shown by Messrs. **S. McGREY & SON**. *British Queen*.—

A white H.T. variety of good form from the same firm. *Nancy Williams*.—Another good H.T. Rose of *La France* type. From Messrs. **McGREY & SON**.

Amongst the new seedling Roses which did not receive any official recognition Mrs. **Geo. Shawyer**, Mrs. **Chas. Reed**, and Lady **Barham** (a large soft pink Rose) were much admired.

PREMIER BLOOMS.

Nurserymen.—H.T., Mrs. **Stewart Clark**, shown by Messrs. **HUGH DICKSON**; H.P., **Hugh Dickson**, by Messrs. **HARKNESS & Co.**; T., Mme. **Jules Graveaux**, by Mr. **GEORGE PRINCE**.

Amateurs.—H.P., Frau **Karl Druschki**, shown by Rev. **J. H. PEMBERTON**; T., White Maman **Cochet**, by Mrs. **AITCHISON**; H.T., *Avoca*, by **E. B. LEHMANN**. Esq.

NATIONAL SWEET PEA.

JULY 11, 12.—The annual exhibition of the National Sweet Pea Society was held on Tuesday and Wednesday last in the Royal Horticultural Hall, Vincent Square, Westminster. The sun shone brilliantly on both days, the weather being very hot, but the atmosphere inside the building was not so oppressively close as in the streets, and the flowers remained remarkably fresh in the circumstances. The Sweet Pea provides a splendid subject for exhibitions, and the show was one of the prettiest floral displays we have observed, the interior of the Hall being a blaze of colour from end to end. Every part of the spacious building was filled with exhibits; indeed, the entries were so numerous that the nurserymen's displays were restricted to a uniform space of 12 feet by 3 feet. These were arranged around the walls, the different styles of staging producing charming effects; some arranged their blooms in tall columns, others in vases and baskets, several had canopies of flowers, more than one arranged beautiful festoons and hanging baskets, whilst others set their choicest blooms in vases beneath bowers. In order to make the Hall as attractive as possible, the honorary secretary, Mr. **C. H. CURTIS** decorated the balcony over the clock with posies of Sweet Peas relieved with greenery. The schedule embraced 44 classes, and these were contested by 150 exhibitors, who staged between them 2,500 bunches, representing 820 separate exhibits. Coming to the details of the show, it will rank as the best of the series; the quality of the flowers was up to the average, although not exceptional; no outstanding novelty was forthcoming, the older varieties well holding their own, and the best flowers in the show were grown in Ireland. The number of challenge cups and other trophies which the Society is enabled to offer in the various classes is remarkable, the 1st prize in almost all the principal classes including either a cup or piece of plate. These were arranged in the centre of the exhibition, in company with those varieties which have been awarded the Society's Certificate of Merit at the trials this year at the *Times* Experimental Station.

The first division in the schedule embraces some eight classes, from which traders are excluded, and the first of these is known as the Sutton Cup Class, a silver cup valued at 15 guineas being presented by Messrs. **Sutton & Sons**. The schedules required 21 bunches, of distinct varieties, to be selected from a list recommended by the Floral Committee. There were only three exhibits forthcoming, and much the best collection was shown by Sir **RANDOLPH BAKER**, Bart., Ransdon, Blandford (gr. Mr. **A. E. Usher**). The following varieties were particularly noteworthy:—*Masterpiece*, Mrs. **Ireland**, King **Edward** (Spencer), Princess **Victoria**, Clara **Curtis**, J. **Ingman**, Mrs. **H. Dickinson**, F. **Norton** (Spencer), Helen **Lewis**, and Nubian. The 2nd prize was awarded to **A. W. STIRLING**, Esq., Holme Lea, Goring-on-Thames (gr. Mr. **A. Moring**); 3rd, Sir **THOS. HESKETH**, Bart., Towcester (gr. Mr. **G. F. Hallett**), whose flowers were spoiled in effect by too short stalks. Mr. **STIRLING** showed a fine vase of King **Edward** (Spencer).

The second class was for 24 bunches of distinct varieties, and five competed for the Society's Silver-gilt Medal, which, with a sum of money, formed the 1st prize. This proved a good competition, some excellent flowers being staged, those in the 1st prize collection being a splendid lot, bright, large, and fresh in appearance, with extra long stalks, and shown to greater advantage by placing them well apart in the bunches. The

exhibitor was again Sir **RANDOLPH BAKER**, and not a weak vase was seen. His best varieties were Mrs. **H. Dickson**, Tennant (Spencer) (one of the finest of the blue shades), *Etta Dyke* (peerless amongst the white kinds), Countess **Spencer**, Sunproof **Crimson**, Bertie **Usher** (with marbling of blue on lighter blue), Mrs. **Hardcastle Sykes**, *Stirling Stent* (the finest orange-coloured Sweet Pea, but with a bad reputation for sporting), *Constance Oliver*, and Marjorie **Linzee**. The 2nd prize was awarded to **J. T. TUBB**, Esq., Oakbank, Sevenoaks, for smaller but very refined flowers, those of a pink shade being delightfully pretty; 3rd, Rt. Hon. **S. G. O. TREVELYAN**, Bart., Wallington Hall, Cambridgeshire (gr. Mr. **E. Keith**).

There was general good quality throughout the whole of the five exhibits staged in the "Henry Eckford Memorial Class" for 12 bunches, distinct. The premier blossoms, shown by **E. G. MOCATTA**, Esq., Woburn Place, Addlestone (gr. Mr. **Thos. Stevenson**) were as near perfection as possible, but the stems were rather short. Great vigour was seen in the stems and petals. Nubian Marjorie **Linzee**, Princess **Victoria**, Anglian **Pink** (a fine Sweet Pea showing orange in the standard), *Elsie Herbert*, Queen of Norway (a good blue variety), Maud **Holmes**, and Anglian **Blue** were some of the more noteworthy. 2nd, Sir **RANDOLPH BAKER**, Mrs. **R. Hallam**, Clara **Curtis**, and *Stirling Stent* being the pick in this group; and 3rd, **A. W. STIRLING**, Esq. (gr. Mr. **A. Moring**).

A special class was provided to commemorate the Coronation of King George, and was known as the Coronation Class. It was for 12 bunches of Sweet Peas with waved standards, distinct, to represent 12 colours. This was an exceptionally well-contested class, and brought some of the finest Sweet Peas in the show, those in the 1st prize exhibit, shown by Mr. **E. COWDY**, Greenhall, Loughgall, Co. Armagh, being the subject of general comment. All his varieties were good, including Countess **Spencer**, Clara **Curtis**, Mrs. **Hardcastle Sykes**, Edna **Unwin** (a magnificent Pea as shown by this exhibitor), *Elsie Herbert* (also a noteworthy variety), Tennant **Spencer**, John **Ingman**, and Flora **Norton**. The 2nd prize was awarded to Mr. **TOM JONES**, Ruabon, a well-known exhibitor, who showed, as usual, high-class flowers of well-known varieties, but eclipsed on this occasion by a newcomer. A vase of the white *Etta Dyke* was grand, and others of merit were *Dazzler* (a fine reddish-scarlet flower), Clara **Curtis**, Menie **Christie**, Princess **Victoria**, John **Ingman**, and *Elsie Herbert*.

The Breadmore Challenge Cup was offered for the best exhibit of 12 bunches distinct, shown by cultivators who do not employ more than one gardener. There were five good exhibits. The 1st prize was won by Mr. **COWDY**, who again exhibited excellent flowers, *Elsie Herbert*, Marjorie **Linzee**, Earl **Spencer**, *Thos. Unwin*, Sunproof **Crimson**, *Asta Ohn*, and Clara **Curtis** being splendidly shown. The largest and boldest flowers were awarded the 2nd prize, the exhibitor being **R. P. BROOK**, Esq., Rosehill, Par Station (gr. Mr. **W. H. Prophet**), the varieties being similar to those already mentioned.

Mr. **BROOK** excelled in the class for six bunches, distinct, showing such excellent varieties as Mrs. **Hardcastle Sykes**, Mrs. **Chas. Foster**, and George **Herbert**; 2nd, Mr. **W. H. RAWNSLEY**, Well Vale, Alford (gr. Mr. **T. Vickers**).

There were several blank spaces in the tabling allotted to Class 7, which was for three bunches of pink or cream-pink varieties with waved standards; but six exhibits furnished excellent vases, Mrs. **Henry Bell**, *Constance Oliver*, and Countess **Spencer**, in the winning collection, shown by Mr. **R. B. BROOKS**, Rosehill, Par Station (gr. Mr. **W. H. Prophet**), being especially good. Mr. **MOCATTA** was placed 2nd with Mrs. **Hardcastle Sykes**, *Olive Ruffle*, and Countess **Spencer**.

Nothing exceptional was seen in the class for three bunches of new Sweet Peas, distinct, Mr. **J. E. PHILLIPS**, Malpas (gr. Mr. **W. Davies**), being given the place of honour for Mrs. **R. Hallam**, *Chas. Foster*, and Lancashire (a pretty shade of pink, showing yellow at the base).

CLASSES OPEN TO ALL.

The classification class constituted the first in this section, and was for 21 varieties, to include not more than one variety of any colour enumerated in the Society's classification list.

There were only two entries, the 1st prize being awarded to Sir R. BAKER. Mr. H. TIGWELL, Greenford, was awarded the 2nd prize.

Messrs. Nutting & Sons offered prizes in a class for 12 bunches, distinct, and 10 competed, affording a keen competition. Mr. T. G. BEALING, Burgess Street Nurseries, Bassett, was placed 1st for a collection of good average merit, the finer varieties being Mrs. Hardcastle Sykes, Maud Holmes, and Tennant Spencer. 2nd, E. OTTER, Esq., Stanhope Park, Greenford (gr. Mr. F. Fairbairn).

The best bunch of new Sweet Peas, of one variety only, was Bertha Massey, a mauve-purple flower, showing a trace of pink, the exhibitor being Mr. E. MOCATTA, Bertrand Deal, a variety somewhat similar, but a little deeper in tone, was awarded the 2nd prize, and Thomas Stevenson, an orange-coloured variety, the 3rd. The prizes were presented by Mr. J. Agate.

The best bunch of two varieties of Sweet Peas was shown by Mr. BROOK, who selected Paradise Ivory and Nancy Perkins. Paradise Ivory and Audrey Crier, shown by Mr. RAWNSLEY, were placed 2nd. There were no fewer than 17 exhibits, so that the contest was a keen one.

Competition was not so good in the class for three bunches, distinct, selected from certain specified varieties, the prizes being offered by Messrs. E. W. King & Co. Sir RANDOLPH BAKER excelled with fine flowers of Anglian Pink, Anglian Orange, and Queen Mary.

The "E. W. King" Challenge Cup for 12 bunches of Sweet Peas, distinct, was won by Mr. BROOKE (gr. Mr. Prophet), there being 15 competitors. The group included splendid bunches of Tom Bolton (a fine dark variety), Etta Dyke, Mrs. H. Dickson, King Edward Spencer, Asta Ohn and Andrew Ireland. 2nd W. H. RAWNSLEY, Esq., Oxford (gr. Mr. S. Vickers).

The "Burpee" Challenge Cup and Gold Medal of the Society formed the 1st prize in the class for a display of Sweet Peas, arranged on a table measuring 8 feet by 3 feet. There were four exhibits, Mr. CHARLES BREADMORE, Winchester, being placed 1st, with splendid flowers of such beautiful sorts as Marjorie Linzee, Aurora Spencer (a pretty pink marbling on white); Dazzler (the orange sheen on the standard is very beautiful), Elsie Herbert and Stirling Stent. 2nd Mr. JAS. BOX, Lindfield, Sussex.

CLASSES FOR SPECIFIED VARIETIES.

Sir RANDOLPH BAKER won the 1st prize for (1) six bunches of Sweet Peas, distinct, selected from Nora Unwin, Nettie Jenkins, Mrs. R. Hallam, Gladys Burt, Eric Harvey, Freda Unwin, Mrs. W. J. Unwin, Edna Unwin, Douglas Unwin, Doris Burt, Clara Curtis and Arthur Unwin (the prizes in this class were given by Mr. W. J. Unwin); (2) six bunches of Sweet Peas, distinct, to include the varieties Sunproof King, Blue Bell and Improved Dudley Lees (the prizes in this class were presented by Messrs. S. Bide & Sons, Ltd.); (3) four bunches of Sweet Peas, distinct, to consist of one bunch each of Premier or Improved George Stark, Hercules, Lord Northcliffe, and Emmie Lathom (the prizes in this class were presented by Messrs. G. Stark & Son); (4) four bunches of Sweet Peas, distinct, to be selected from the varieties Scarlet Monarch, Bertrand Deal, Empress, Winsome, Colleen, Giant Cream Waved, Winifred Deal and Queenie (the prizes in this class were given by Mr. William Deal); and (5) one bunch of Mrs. Eastham (the prizes were given by Messrs. Jones & Sons, Ltd.).

Mr. Tom Jones showed the best six bunches, distinct, to include the varieties Edrom Beauty, Isabel Malcolm and Dobbie's Sunproof Crimson (the prizes in this class were given by Messrs. Dobbie & Co.).

The "Hawmark" Challenge Cup for twelve bunches, distinct, open to amateurs (the cup, valued at 20 guineas, presented by Messrs. Alex. Dickson & Sons), was won by Mr. JAMES HALL, Moy, Co. Tyrone. Again these Irish-grown Peas were of splendid quality, and embraced such sterling varieties as Earl Spencer, Etta Dyke, Tennant Spencer, Edna Unwin, Marjorie Linzee, Mrs. W. J. Unwin and Mrs. C. W. Breadmore.

The piece of silver plate offered by Commander Humphery, R.N., in the class for six bunches of Sweet Peas, distinct, was won by Mr. J. BRACH, Elphicks Farm, Horsmonden, Kent; the "Horace Wright" Cup for twelve bunches, dis-

ting, by Mr. EDGAR JONES, Turnford Villas, Broxbourne, and the "Walter Voss" Challenge Cup by Mr. LEWIS PETERS, Strathmore, St. Austell.

NOVELTIES.

The following awards were granted by the Floral Committee at the Society's trials at Sutton.

FIRST-CLASS CERTIFICATES.

Barbara (orange), shown by Mr. ROBERT HOLMES, Norwich.

Dobbie's Thomas Stevenson (rose, with orange sheen in the standard), shown by Messrs. DOBBIE & Co.

AWARDS OF MERIT.

Red Star (reddish crimson), shown by Mr. A. MALCOLM, Duns.

May Campbell (cream ground marbled with carmine).

Mauve Queen (mauve, showing suffusions of rose and lavender).

Mrs. B. Gilbert (suffusion of purple-lilac down the middle of the standard, with a staining of this colour on the white wings). These three from Messrs. DOBBIE & Co.

F. Seymour Davis (rosy-lilac with a silvery sheen), shown by Mr. F. SEYMOUR DAVIS, Farnham.

AWARDS TO NON-COMPETITIVE EXHIBITS.

Large Gold Medal to Mr. R. Bolton, Carnforth.

Gold Medals to Messrs. Dobbie & Co., Edinburgh; Robert Sydenham, Ltd., Birmingham; James Carter & Co., Raynes Park.

Silver-gilt Medals to Mr. James Box, Lindfield, Sussex; Messrs. Sutton & Sons, Reading; S. Bide & Sons, Ltd., Farnham, Surrey; and Mr. Wm. Deal, Brooklands, Kelvedon, Essex.

Silver Medals to Messrs. Carter Page & Co., London Wall; J. Stevenson, Wimborne; E. W. King & Co., Coggeshall; Jones & Sons, Shrewsbury; W. E. Alsen, Denmead, Hampshire; Chas. W. Breadmore, Winchester; and G. Stark & Son, Great Ryburgh.

Bronze Medals to Messrs. W. O. Cautley, Bury St. Edmunds; W. Lumley & Co., Hayling Island; Aldersey and Marsden Jones, Tilston, Malpas, and Jarman and Co., Chard.

Other exhibitors of non-competitive groups were Mr. Alf. Edwards, Fordham; Messrs. Walter Voss and Co., Ltd., Millwall; and Mr. P. E. Coleman, Elsenham, Essex.

WOLVERHAMPTON FLORAL FÊTE.

JULY 11, 12, 13.—The annual floral fête, held in the West Park, Wolverhampton, was favoured with beautiful weather on the opening day, when a great crowd of visitors passed through the five large tents in which exhibits from nearly all parts of the country were displayed. The show compared very favourably with the best of its 22 predecessors, and it is doubtful if Roses, Sweet Peas, hardy flowers, and groups of foliage and flowering plants have ever been seen in greater variety or of better quality at Wolverhampton. Fruit was not very largely shown. The number of entries exceeded those of last year.

PLANTS.

The most important group class was one for a collection of plants in or out of bloom arranged on a space of 30 feet by 12 feet down the centre of the unusually large and lofty marquee. Cut flowers in vases or concealed receptacles containing water were allowed. Four prizes were offered, viz.: 1st £40; 2nd £30; 3rd £20; 4th £10. There were four exhibits. The first prize was won by Messrs. J. CYPHER & SONS, Cheltenham, who had an artistically-arranged group of choice foliage and flowering plants, in which were many varieties of richly-coloured Codiaums, Catleyas, Phalaenopsis, Oncidiums, Kalanchoë flammea, Ixoras, &c., were effectively used over a beautiful groundwork of Caladium argyrites, Begonias, Ferns and other plants. An ornamented rustic bridge formed the centre-piece, and on either side there were tall arches decorated with crimson and white Carnations. 2nd, Sir GEORGE H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), whose exhibit was rich in foliage plants (especially Codiaums), but rather weak in flowers. Although the arrangement was effective, it was hardly equal to

some previous efforts of this well-known Midland exhibitor. In the 3rd prize group, which came from Mr. W. A. HOLMES, Chesterfield, yellow-leaved Codiaums were a feature.

The group class next in importance was reserved for ornamental foliage plants, Ferns, &c. (flowers and plants in bloom not allowed), to cover 250 square feet. Here again Messrs. J. CYPHER & SONS excelled with remarkably well-grown and exquisitely-coloured Codiaums arranged over an irregular body-work of light-leaved Caladiums, Coleus, &c., relieved with Palms, well-coloured specimens of Nandina domestica, &c. The 2nd award fell to Mr. W. A. HOLMES. 3rd, Sir GEORGE H. KENRICK (gr. Mr. J. V. Macdonald). 4th, Mr. W. VAUSE.

In a class for 20 plants in pots not exceeding 8 inches in diameter there were three exhibits. At least eight specimens were to be in bloom. 1st, Messrs. JAS. CYPHER & SONS, who exhibited nine well-flowered Ixoras, seven Clerodendrons, two Acalyphas, one Croton and one Dracæna. 2nd, B. H. MAUNDER, Esq., Trysull, Wolverhampton (gr. Mr. C. Weaver).

In a class for a group of flowering plants, limited to one kind only, but any number of colours or varieties of the same kind allowed, on ground space of 50 square feet, four exhibits were placed before the judges, who awarded the 1st prize of £10 to Messrs. BLACKMORE & LANGDON, Bath, for a splendid collection of named varieties of double-flowered tuberous-rooted Begonias. The flowers were shapely, of great substance, in some cases about 7 inches across, and represented a wide range of colour, from pure white, through shades of cream, pink, and rose to scarlet and crimson. 2nd, Mr. F. DAVIS, Pershore, also for Begonias, but these were rather past their best. 3rd, Messrs. J. CYPHER & SONS, who showed Clerodendrons.

J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), won 1st prizes in classes provided for (1) a collection of Caladiums, in not fewer than six distinct varieties, and (2) a collection of Coleus in not fewer than four varieties. Messrs. J. CYPHER & SONS, had the best half-dozen specimen Palms.

Only two exhibits were made in the amateurs' class for a group of plants in or out of bloom, on a space of 250 square feet. J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Cryer), was placed 1st for a bold arrangement, consisting of good Ixoras, François, Kalanchoës, Crotons, Dracænas, Palms, Bamboos, and Ferns. 2nd, Mr. W. R. MANNING, Dudley.

Four exhibits were made in a class for 12 Begonias (six single and six double). 1st, J. TAYLOR, Esq., Pershore, with large, heavy, well-flowered specimens. 2nd, J. A. KENRICK, Esq. (gr. Mr. A. Cryer).

ROCK AND WATER GARDENS.

During recent years rock and water gardens have become very popular at exhibitions, and the three exhibits in a special class provided for them found hosts of admirers on the first day of the show. Each competitor was allotted space not exceeding 30 feet by 14 feet. The 1st prize was gained by Messrs. J. BACKHOUSE & SON, York, who had a bold design of rockwork, planted with a rich collection of subjects, including Campanulas, Sedums, Spireas, Sarracenias, dwarf Conifers, &c. Near the front there was a miniature pool, with Lilies floating on the water surface. At one corner of the group a stream of water trickled over the huge boulders; it was very realistic. Mr. J. E. KNIGHT, Wolverhampton, who was placed 2nd, had a well-designed exhibit suitably planted; the effect was pleasing. 3rd, Messrs. W. ARTINDALE & SONS, Sheffield.

ROSES.

Roses were shown in splendid condition, and Mr. HUGH DICKSON, of Belfast, Ireland, was the most successful exhibitor of these flowers.

The principal class was for 72 varieties, distinct. 1st, Mr. HUGH DICKSON, with exquisite specimens of George V., Lyon Rose, Archie Gray, Leslie Holland, Lehengrin, Hugh Dickson, Frank Thorpe, Charles K. Douglas, Countess of Shaftesbury, Oberhofgartner Terks, Mrs. Foley Hobbs, and William Shean. Messrs. HARKNESS & Co., Hitchin, were 2nd with rather small but shapely blooms of Hugh Dickson, Edward André, Earl of Dufferin, Charles LeFebvre, William Shean, and Florence Pemberton.

3rd, Mr. GEORGE PRINCE, Oxford. 4th, Messrs. PERKINS & SON, Coventry.

Mr. HUGH DICKSON beat five competitors in a class for 48 varieties, distinct. He had superb blooms of Rhea Reid, Yvonne Vacherot, Archie Gray, C. K. Douglas, Bessie Brown, and J. B. Clark. 2nd, Mr. G. PRINCE, Oxford.

In a class for 12 varieties, three blooms of each, Mr. HUGH DICKSON again took the lead with a very choice, level lot of blooms of the Lyon Rose, Hugh Dickson, Caroline Testout, Leslie Holland, and Mrs. Stewart Clark. 2nd, Messrs. HARKNESS & Co., Hitchin, whose best blooms were Hugh Dickson, A. K. Williams, and Duchess of Bedford.

In a class for 24 varieties, distinct, there were eight good exhibits, and the 1st prize went to the Belfast grower, Mr. HUGH DICKSON, who showed large, shapely specimens of J. B. Clark, Frau Karl Druschki, Lohengrin, and the Lyon Rose. 2nd, Mr. J. MATTOCK, Oxford, whose best blooms were the Lyon Rose, A. K. Williams, Mme. Victor Verrier, and Suzanne Marie Rodocanachi. 3rd, Messrs. HARKNESS & Co.

Mr. HUGH DICKSON was also placed 1st in classes for (1) 12 varieties put into commerce during the years 1908, 1909, and 1910, and (2) a bowl of Roses.

The best dozen blooms of any dark-coloured Rose were of the variety Reynolds Hole, exhibited by Mr. GEORGE PRINCE. Messrs. PERKINS & SONS took the lead in a class provided for 12 light Roses; and Mr. GEORGE PRINCE had the winning set of 12 Tea Roses.

In a class for 12 bunches of decorative Roses, shown with their own foliage and buds, there were seven excellent exhibits. 1st, Mr. J. MATTOCK, whose bunch of the Lyon Rose was exceptionally good. The same exhibitor was placed 1st in a keenly-contested class for a vase of Roses.

BOUQUETS AND CUT FLOWERS.

Messrs. PERKINS & SONS, Coventry, secured 1st prizes in classes provided for (1) bouquet for the hand, and (2) bridal bouquet (with Orchids) and two bridesmaids' bouquets (Orchids excluded).

The best collection of decorative plants and bunches of cut flowers arranged on staging in a space not exceeding 6 feet by 4 feet was shown by Messrs. BASTOCK & SON, Moseley, Birmingham. 2nd, Sir GEORGE H. KENRICK, Edgbaston (gr. Mr. J. V. Macdonald).

Messrs. HARKNESS & SONS, Bedale, had the most attractively-arranged group of hardy border flowers on a table space measuring 15 feet by 5 feet, employing four tiers. They showed excellent bunches of Lilliums, Gaillardias, Alstroemerias, Phlox, Campanulas, Cimicifuga racemosa, and Malvas. 2nd, Messrs. G. GIBSON & Co. The last-named exhibitors excelled in a class for Delphiniums. The spikes were long and strong, especially those bearing dark flowers. 2nd, Messrs. HARKNESS & Co., Bedale. 3rd, Messrs. BLACKMORE & LANGDON.

There was strong competition in a class for a decorated dinner table measuring 8 feet by 4 feet. The 1st prize was awarded to Miss ADA DAVIS, Pershore, who employed orange-coloured Alstroemerias, yellow and white Sweet Sultan, and sprays of a small, yellow-flowered Oncidium. 2nd, Mrs. NEWBOLD, Derby, with yellow-shaded Roses relieved with sprays of Selaginella and Adiantum Ferns.

Of the eight exhibits in the class for dinner tables, decorated only with Sweet Peas, Miss F. JENKS, Codsall, excelled with a decoration of pale pink flowers and long sprays of Selaginella.

For a display of Carnations on a space of 6 feet by 4 feet there were two entries only. The 1st prize was well won by Mr. C. F. WALTERS, Balcombe, whose long-stemmed flowers were very handsome. 2nd, Mr. J. E. KNIGHT, Wolverhampton.

SWEET PEAS.

In a class for 18 varieties of Sweet Peas, Sir R. L. BAKER, Bart., M.P., Ranston (gr. Mr. A. E. Usher), beat three exhibitors with unusually large, substantial flowers borne on long, strong stems; 2nd, Dr. J. E. PHILLIPS, Malpas.

Mr. Henry Eckford offered prizes for 12 varieties, and the 1st prize was awarded to Mr. J. WATSON, Wem, Salop, for beautifully fresh flowers effectively displayed. 2nd, Mrs. TWENTYMAN, Wolverhampton (gr. Mr. C. T. Flower).

Robert Sydenham Limited also offered prizes for 12 varieties, Mrs. W. D. T. RICHARDS, Kingswinford, winning the 1st prize.

F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H. S. Foster), was placed 1st in a class for six varieties, the prizes for which were also offered by Robert Sydenham Limited.

Messrs Bakers offered prizes for six varieties. Sir R. L. BAKER, Bart., M.P. (gr. Mr. A. E. Usher), led with superb flowers. This exhibitor was also an easy 1st in a class provided by Messrs. Webb & Sons for six varieties.

FRUIT AND VEGETABLES.

In a class for four bunches of Grapes there were five entries. The 1st prize was awarded to J. DRAKE, Esq., Orford House, Market Rasen (gr. Mr. W. Parker), for handsome bunches of Madresfield Court, Black Hamburg, Muscat of Alexandria, and Buckland Sweetwater. 2nd, the Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), who also secured 1st prizes in classes for (1) one dish of Peaches, (2) one dish of Nectarines, and (3) three dishes of Tomatos.

Lord HATHERTON, Teddesley, Penkridge (gr. Mr. H. Taylor), had the best three dishes of Strawberries.

The leading fruit class was for 10 dishes in not fewer than seven kinds. The 1st prize was awarded to the Duke of NEWCASTLE (gr. Mr. W. Parker), whose dishes of Lady Sudeley Apple, Grosse Mignonne Peach, Lord Napier Nectarine, Negro Largo Fig, Melons, and Madresfield Court Grapes were of superior merit. 2nd, J. DRAKE, Esq. (gr. Mr. W. Parker); 3rd, The Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes).

The only display of fruit trees in pots came from the KING'S ACRE NURSERIES, Hereford, who were awarded the principal prize of £20, together with an extra prize of £5, given by Alderman Craddock.

VEGETABLES were not strongly represented. In Messrs. Webb & Sons' class for eight kinds, the Marquis of NORTHAMPTON (gr. Mr. A. R. Searle) beat five competitors. 2nd, Mr. E. DEAKIN, Hay Hall, Hay Mills. In a smaller class, in which the prizes were also offered by Messrs. Webb & Sons, Sir T. C. MANDER, Bart., Tettenhall Wood, Wolverhampton (gr. Mr. J. F. Simpson), was awarded the 1st prize.

Messrs. Sutton & Sons' prizes were offered for six kinds, and in this class the 1st prize was won by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), with excellent produce.

HONORARY EXHIBITS.

Mr. B. LADHAMS, Shirley, Southampton, arranged a bright bank of hardy flowers (Silver-gilt Medal). Mr. H. N. ELLISON, West Bromwich, showed a group of Ferns, for which a Silver-gilt Medal was awarded. Lady GREY, Enville Hall, Stourbridge, showed a large group of well-grown and well-flowered plants of Souvenir de la Malmaison Carnations (Gold Medal). Mr. W. J. UNWIN, Histon, showed 36 varieties of Sweet Peas. Messrs. DICKSON'S, Chester, had a large collection of Roses and hardy herbaceous flowers (Gold Medal). Messrs. JARMAN & Co., Chard, Somerset, contributed Centaureas, Carnations, and Zonal Pelargoniums (Silver Medal). Messrs. WEBB & SONS, Wordsley, arranged a large exhibit of flowering plants, cut flowers, Melons, and vegetables (Gold Medal). Messrs. CLIBRANS, Altrincham, displayed Roses in variety (Silver-gilt Medal). H. LEE, Esq., Wolverhampton, showed tree Carnations. Messrs. H. B. MAY & SONS, Upper Edmonton, contributed an interesting collection of Ferns (Gold Medal). Floral devices were shown by Messrs. SUCKLING, Wolverhampton (Silver-gilt Medal). Messrs. BAKERS, Wolverhampton, had a small Rose garden, a water garden, and a raised herbaceous border faced with red sandstone planted with a pleasing variety of suitable subjects (Gold Medal and a special piece of plate). Messrs. BLACKMORE & LANGDON, Bath, showed Carnations (Silver Medal). Mr. EDWIN MURRELL, Shrewsbury, arranged Roses in vases and Bamboo stands. Mr. AMOS PERRY, Winchmore Hill, exhibited 50 varieties of Delphiniums. Mr. J. E. KNIGHT, Wolverhampton, showed floral devices (Silver Medal).

Delphinium Carnegie, shown by Mr. AMOS PERRY, Winchmore Hill, was awarded a First-class Certificate.

Obituary.

G. WOODGATE.—We regret to record the death of Mr. George Woodgate, which took place on the 5th inst., at Kenley, Surrey. Mr. Woodgate was head gardener to Sir Oswald Moseley, Bart., Rolleston Hall, Burton-on-Trent, for 15 years, but he retired last year. He was formerly in the service of Lord Wolverton, at Warren House, Kingston Hill, Surrey, during which period acted as secretary of the Old Kingston Chrysanthemum Society, succeeding the first secretary, Mr. Thomas Jackson. In those days the Kingston Challenge Cup for Chrysanthemums was the most coveted trophy in the Chrysanthemum world. Mr. Woodgate was held in high esteem by a wide circle of friends. He was an excellent gardener, and he possessed personal qualities that endeared him to those with whom he was intimately acquainted. The funeral took place at Beddington Cemetery on the 10th inst.

BEANS AND PEAS DYING: W. F. B. The roots have been destroyed by wireworms and millipedes. It is now too late to save the crop, but good will be done by adding lime to the soil.

BEECH COCCUS: Constant Reader. Scrub the main stem and stouter branches with caustic alkali wash. Gloves should be worn by the operator to protect the skin from injury. The portion of the trunk bare of bark may be treated with Stockholm tar, or, failing that, ordinary gas tar.

BEGONIAS AT AN EXHIBITION: A. B. Begonia Gloire de Lorraine and Turnford Hall are distinct varieties, but under the circumstances it would be advisable to select only one of this type. There are other Begonias that flower in the winter, including the hybrids raised by Messrs. James Veitch & Sons, as well as several free-flowering species.

BLACK APHIS ON CHERRY TREES: H. B. The best remedy for black aphid (fly) on Cherries is to spray with soft soap and quassia; in some season this does not seem to destroy the pest so successfully as in others, and then it is advisable to add one ounce of liver of sulphur to every 10 gallons of the soap and quassia wash.

BOOKS: Constant Reader. The chief books on pests destructive to plants are the following:—*The Insect and Allied Pests of Orchard, Bush and Hothouse Fruits*, F. V. Theobald; *Farm Insects*, by J. Curtis; *A Text Book of Agricultural Zoology*, by F. V. Theobald; *Agricultural Zoology*, by Ritzema Bos. The French work you mention may also be recommended.

CARNATION SPORT: A. B. C. The flower was too faded for us to judge its merits. Send a specimen, packed in damp moss, for the consideration of the Floral Committee of the Royal Horticultural Society which meets on Tuesday next. We do not undertake to name varieties of Pelargonium.

CATERPILLAR ON ROSES: H. H. The caterpillar attacking your Roses is that of the Brindled Beauty Moth, *Biston hirtaria*. Lucet in *Les Insectes Nuisibles aux Rosiers* refers to the pest on Roses, although its usual food is Elm, Lime, and Privet. There are great numbers of insects which attack Roses only occasionally.

CONTRACT: Enquirer. Assuming that your last telegram was so worded as to constitute a definite acceptance of the salesman's quotation, there would appear to be a binding contract for the breach of which you could claim damages. With regard to the suggested confusion in nomenclature, we do not think there is any such trade custom as the salesman suggests. Yellow Marguerites are generally considered to be *Chrysanthemum frutescens* var. *Etoile d'Or*.

DAHLIA BLIGHT: *E. J. N.* The injury to the plants is caused partly by aphids, but their unhealthy condition is mostly due to the unfavourable surroundings in which they have been grown.

EXPENSES INCURRED BY APPOINTMENT: *C. H.* We do not think that you could make a successful claim for the expenses you incurred in taking up the situation, but you have omitted to state why you are leaving so soon, although this is important. If a candidate seeking employment feels that he is entitled to some compensation for expenses incurred in removal he should make a point of getting a signed agreement on the matter. We have repeatedly recommended this practice, but many gardeners appear careless, and in consequence disputes arise from time to time owing to misunderstandings which would never arise if proper arrangements were made before taking up the situation.

FIGS DROPPING: *A. H. D.* Fig-tree canker is the cause of the trouble. The disease is probably present also on the branches, the affected parts of which should be cut out and the wounds covered with tar.

GOOSEBERRIES DISEASED: *K. G. F.* The Gooseberries are attacked by the American Gooseberry-mildew. This is a notifiable disease, and its presence should be reported to the Secretary, Board of Agriculture, 4, Whitehall Place, London, who will send you a pamphlet giving full particulars of treatment.

GRAPES SPOTTED: *H. S. and W. D. A.* The injury to the Grapes has been caused by a deposit of moisture on the berries. The extremes of temperature are great and cause a precipitation of moisture at night time.

HERBACEOUS CALCEOLARIA: *J. Newton.* There are several species of herbaceous Calceolaria found in western South America, only about two of which are hardy in this country. A good example is *C. polyrhiza*, a native of Patagonia. This plant is quite hardy, and spreads by means of underground stems, which produce leafy flowering stems a few inches high. In winter, the plant dies down to below the ground level; but, in the following spring, commences to grow again like any other perennial. Another species that is hardy in sheltered places, but more tufted in growth, is *C. plantaginea*. This also dies quite down in winter, and may be described as an herbaceous perennial.

HOLLOW-BUILT WALLS. *A. G. S.* Experience has proved that a hollow-built wall—that is, a wall with an open space of 4 inches in the centre, is not warmer than a solid-built wall; indeed, a solid-built 9 or 12-inch brick wall would attract and absorb the solar rays much more effectively. Another advantage of a solid wall is its stability and its suitability for training fruit trees, whether the trees are secured by means of shreds and nails or a wire trellis. The cost of constructing a hollow wall would be very little cheaper than one made in the ordinary manner. We may cite, as an example, two walls, about 100 feet in length each, and about 100 yards apart—south or northward. To each were trained Fig trees. One length of wall was hollow in the centre, and the other length was solid. The trees on the solid wall pushed into growth a little earlier and ripened the fruits earlier than those trained against the hollow wall.

HORSE CHESTNUT LEAVES: *C. & Sons.* No disease is present. The injury has been caused by drought.

LILUM AURATUM: *J. T.* We cannot ascertain the cause of the trouble from the portion of the plant sent us. Probably the bulb is diseased.

LOMATIA PINNATIFOLIA: *G. H. Johnston.* The correct name of this plant is *L. ferruginea*. It is a handsome and rare evergreen bush or tree, growing from 10 feet to 20 feet high, with deeply-toothed, leathery leaves. A native of Chili and Patagonia, it was one of the earlier introductions of Messrs. Veitch & Sons, having been collected by William Lobb in western South America in 1845-8. Owing to the difficulty of propagating this plant, it has not become common, but it is quite hardy in Ireland and in the south-western counties of

England. The rosy-red and white flowers are produced in racemes in the axils of the leaves, and are almost entirely hidden by the foliage. A full account of this plant, with illustrations, may be found in the *Gardeners' Chronicle*, 1907, xlii., p. 233.

MELON PLANTS WITHERING: *Hampstead.* The Melon roots are affected with eelworm, and it is almost impossible to do anything to save the plants. Try treating the soil with "Phenol," which may check the spread of the pest. When the plants are removed, mix gaslime with the soil.

MULBERRY: *S. B. Clarke.* It is not in the least necessary to graft the Mulberry; indeed, we know of no suitable stock. It is increased with the greatest ease by means of cuttings. These may be made of leafy wood, about the present time, and they should be inserted under a handlight; or leafless shoots may be put in the open ground as soon as the leaves fall, just the same as is done for Willows. Even stems 1 inch or more thick will form roots.

NAMES OF PLANTS: *A. D.* 1, *Gesnera zebrina*; 2, send when in flower; 3, *Salvia splendens*; 4, *Saxifraga sarmentosa*; 5, *Begonia multiflora*; 6, *Hæmanthus Katherinæ*; 7, *Curculigo recurvata*.—*Q. S. A. L.* *Maranta Makoyana* and *Chlorophytum elatum variegatum*.—*Anxious.* 1, A natural hybrid between *Odontoglossum Wallisii* and *O. odoratum*; 2, *Oncidium macranthum*.—*H. W.* *Hæmanthus multiflorus*.—*O. R.* 1, *Odontoglossum Lindleyanum*; 2, *Oncidium pubes*; 3, *Catasetum cristatum*; 4, *Stelis micrantha*; 5, *Pleurothallis scapha*; 6, *Octomeria diaphana*.—*C. W.* *Wolverhampton.* 1, *Codiaeum Queen Victoria*; 2, *C. Evansianum*; 3, *C. Weissmannii*; 4, *Gesnera tubiflora*.—*F. M.* 1, *Silene inflata*; 2, *Saxifraga cordifolia*; 3, *Tradescantia virginica*; 4, *Funkia ovata*; 5, *Lamium longiflorum*; 6, *Senecio Doria*; 7, *Polemonium coeruleum album*; 8, *Chrysanthemum maximum*; 9, *Cephalaria tartarica*; 10, *Lythrum salicaria*; 11, *Lysimachia vulgaris*; 12, *Campanula glomerata*; 13, *Eriogonum aurantiaca*.—*W. R.* The Rose was insufficiently fresh for identification.—*C. W.* *Elæagnus multiflora*.—*J. Eyre, Weasenham.* 1, *Cercis Siliquastrum* (Judas Tree); 2, *Vitis* sp.; 3, *Catalpa* sp.; 4 and 6, *Rubus Lambertianus*; 5, *R. ichangensis*; 7 and 8, *Vitis* sp.; 9, *V. sinensis*; 10, *V. repens*; 11, *Kalmia augustifolia*; 12 and 13, forms of *Veronica speciosa*; 14, *Vitis* species. Some of the specimens are new Chinese shrubs, their identity being as yet somewhat uncertain. On another occasion do not send more than six specimens at one time.—*A. S.* 1, a garden variety of *Phyllocactus*; 2, *Gasteria verrucosa*; 3, *Kerria japonica*; 4, *Lippia citriodora*; 5, *Bougainvillea Sanderiana*; 6, *Swainsonia coronillifolia*; 7, *Ardisia crenulata*; 8, *Ruellia maculata*; 9, *Hibiscus rosa-sinensis* var. *Cooperi*; 10, *Liriope spicata variegata*; 11, a garden variety of *Codiaeum variegatum*.—*Fernie.* 1, *Polystichum angulare* (practically normal); 2, resembles *Lastrea æmula*, but the specimen being shrivelled and barren, this name must not be accepted with certainty; it might possibly be a seedling of *L. dilatata*; 3, *L. filix-mas*; 4, *L. f.-m.* (may be named *distans*); 5, *L. f.-m.* foliose, but the form is not worth naming.—*R. L., Highbury.* We do not undertake to name varieties of *Pelargoniums* (*Geraniums*). Send them to some nurseryman who makes a speciality of the plants.—*H. A.* 1, *Hypericum Moserianum*; 2, *Dianthus fragrans*; 3, *Hesperis matronalis*; 4, *Campanula carpatica*; 5, Rose (too far faded to identify); 6, *Sedum oppositifolium*; 7, *S. rupestre*; 8, *Vitis* sp.; 9, *Cephalaria alpina*.—*A. B. H.* *Vitis rupestris* and *Asperula odorata*.—*E. G. H.* *Escallonia Philippiana*, a native of Chili.—*M. A.* *Catasetum cristatum*.—*Hortus.* 1, *Lapeyrousia cruenta*; 2, *Maranta bicolor*; 3, *Abutilon megapotamicum*; 4, *Graptophyllum hortense*; 5, *Polygala oppositifolia*; 6, *Cyrtanthus lutescens*.—*J. C. P.* *Hæmanthus coccineus*.

PEAR LEAVES EATEN: *J. K.* The Pear leaves are attacked by the larvæ of the Pear-leaf sawfly, *Eriocampa limacina*. They are generally spoken of as the slugworm or sneg. This slugworm is a very common and often harmful

insect to Pear trees, especially when attacked early in the season, as in your case. Spray the trees with arsenate of lead, which may be obtained in paste form from the horticultural sundriesmen. Apply the specific as a fine spray.

PLUM LEAVES WITH SILVER BLIGHT: *A. S.* The trees are affected with "silver leaf." The issue for November 12, 1910, contains an illustrated summary on the latest investigations in the disease.

ROSE: *Barnclith.* The Rose you send is *Mme. Plantier*. This variety was introduced to commerce in 1835, which will probably account for your friends not recognising it. There are few more reliable white Roses than this variety.—*K. & B.* The flowers you send are those of the old green Rose, *viridiflora*. It belongs to the China class, and was introduced in 1856.—*L., Hants.* The sport from *Crimson Rambler* is scarcely worth keeping; there are many varieties of the same colour which possess superior qualities.

ROSES DAMAGED BY INSECT: *Regular Reader.* The damage to the Roses has been caused by the larvæ of two species of sawfly. The skeletonised leaves are due to the Rose slugworm, *Eriocampa rosæ*; the curled leaves are infested by the larvæ of the leaf-rolling sawfly, *Blennocampa pusilla*. The former pest may be killed by spraying with nicotine wash, arsenate of lead, or paraffin emulsion.

SEEDLING BRIARS: *W. B. M.* Rose hips seldom germinate evenly. A period of from three to twelve months sometimes elapses before they show signs of growth. It may be that your seeds were kept too dry, or mice may have damaged them.

SLUGS AND SNAILS IN A TOWN GARDEN: *Mrs. M. M. F.* Your best plan to destroy the slugs and snails under the special circumstances you describe is to dig into and sprinkle on the soil the preparation known as "Vaporite." Snails may, to some extent, be destroyed by nicotine wash. When the leaves are much curled nothing but hand picking is effectual, as the creature is so concealed as to not be reached by any system of spraying.

SPRING ONIONS DISEASED: *E. T., Welwyn.* The plants are affected with the Onion-bulb rot, and no cure can be effected at this late stage. It will be well to add lime to the soil when the crop is removed.

SWEET PEAS UNHEALTHY: *A. V. B.* Water the roots four times at intervals of three days with a solution of sulphate of potash—one ounce to one gallon of water.

TOMATOS DISEASED: *Toms.* The plants are affected by a bacterial disease, infection being brought about by insects when the plants are in bloom. Endeavour to keep down insects as much as possible.

TOMATOS WITH HARD PATCHES: *H. C., Woolton.* No disease is present. The spotted appearance and unequal ripening of the fruits are due to a lack of sulphide of potassium in the rooting medium. Water the roots at intervals of three days with a solution of one ounce of this substance in one gallon of water.

TULIPS PLANTED WITH ROSES: *A. B.* We do not suspect that the Tulips are responsible for the failure of the Roses, unless the roots of the latter were unduly disturbed when planting the bulbs. It is probable that the soil is at fault. Apply a mulching of cow manure at this season, and fork it into the ground in the autumn.

VINE LEAVES: *Subscriber.* No disease is present, but the foliage is very badly infested with aphids. Nicotine compounds are the best specifics to employ in the case of this pest.

XANTHOCERAS SORBIFOLIA: *P. L. H.* This species does not often fruit in this country. The fruit is not edible, neither does it appear to possess any economic value. The tree belongs to the Order Sapindaceæ, and is allied to the Horse Chestnut.

POTATOS FOR AUSTRALIA.

FOR the last year or two it has been almost impossible for British seedsmen to export Potatos to any part of Australia. A Quarantine Act was passed in 1908 prohibiting the importation of plants or parts of plants, and under that Act several proclamations have been made. In the *Australian Gazette*, of October 1, 1910, the importation into Australia of Potatos from any country in which the disease *Chrysophlyctis endobiotica* (*Synchytrium endobioticum*, Percival) is known to exist was prohibited, and from any other country, unless certain conditions were complied with. Further, by a Proclamation published in the *Gazette* of December 31, 1910, the importation into Australia of Potatos from any country was prohibited, unless certain conditions were complied with in respect of the disease caused by *Phytophthora infestans*.

In the *Gazette* of March 25, 1911, a further Proclamation by the Governor-General appeared as follows:—

"Now therefore I, William Humble, Earl of Dudley, Governor-General, acting with the advice of the Federal Executive Council, do hereby repeal the Proclamation of 1st October, 1910, so far as it relates to the importation of Potatos into Australia, and I hereby repeal the Proclamation of 31st December, 1910, and I do hereby prohibit the importation of Potatos from any country unless—

1. They are accompanied by an official certificate, dated and signed by a responsible officer of a Government Depart-

ment of the country of origin, identifying the Potatoes, specifying the quantity, and certifying—

(a) That at the date of the issue of the certificate they were free from the disease caused by *Phytophthora infestans* (known as Irish Blight), and from the disease *Chrysophlyctis endobiotica* (known as potato canker, black scab, warty disease, and cauliflower disease in potatos);

(b) That they were grown in the country named;

(c) That they were grown at least twenty miles from any place known, after due investigation, to be or to have been within five years infected with either of the said diseases;

(d) That they were packed in the country of origin in clean, new packages.

2. The bags, crates, or other packages containing the Potatos are marked on the outside with the name of the country of origin and with other distinguishing mark or marks.

3. The Potatos, after being landed, are planted in quarantine in an approved place, and, after having matured, are, with the product of their cultivation, found, on inspection, to be free from disease.

4. The importer enters into a bond in the sum of £50, conditioned that he will pay the cost of inspection of the Potatos and of supervision, and that the Potatos and any parts thereof, and any crop produced therefrom, shall not be dug or removed from the approved place without the written permission of the Chief Quarantine Officer, and that he will give written notice of not less than one week to the Chief Quarantine Officer of his desire to dig the Potatos

"Provided that the Minister may permit Potatos which are certified by a Quarantine Officer to be free from disease to be imported under and subject to such conditions as the Minister may think fit to impose, for use as food."

This is a matter of very great importance to the large seed merchants and others who are interested in the Australian trade. It is of equal importance, of course, to those in Australia who are interested in obtaining the best varieties of Potatos from Britain. The new rules do not improve the situation. It will be next to impossible to find a district in this country in which Potatos have been grown for five years and have never been infected with *Phytophthora infestans*, and quite impossible to find one where this disease has not occurred within a radius of twenty miles.

The treatment which is to be meted out to the Potatos after arrival is interesting. They are to be grown in quarantine, and will not be allowed to be distributed until they have proved themselves free from the diseases mentioned to the satisfaction of the Chief Quarantine Officer. This restriction clearly indicates that the Authorities have only in view importations of comparatively small lots for seed purposes.

In the circumstances it would be a good policy on the part of the Australian Agri-

cultural and Horticultural Authorities to endeavour to raise races of Potatos for themselves. They could obtain seed grown in this country from the best varieties, and in a few years time they would be in possession of good stocks. In the presence of restrictions such as are now promulgated it is impossible for British firms to do business in the ordinary way of exporting Potato tubers. W.

NEW OR NOTEWORTHY PLANTS.

MELIANTHUS INTERMEDIUS, HYB. NOV.†

MELIANTHUS COMOSUS has been growing at La Mortola since 1872, when the late Mr. Daniel Hanbury received seeds of it from the late Prof. MacOwan. In *Bot. Mag.*, tab. 301, this plant is figured under the name of *M. minor*. We further grow *M. major*, an old garden plant, of which the introduction is unknown to me, and also *M. pectinatus*, figured in *Bot. Mag.*, tab. 6557, as *M. Trimenianus*. *M. Trimenianus* was brought from Kew by Mr. Daniel Hanbury in November, 1874, and flowered here in 1879 for the first time. From this specimen the plate in *Bot. Mag.* was drawn.

Several years ago a fourth plant made its appearance at La Mortola by the side of a bush of *M. comosus*, so that the branches of the two plants are quite intermixed with each other.

This new-comer proved to be a hybrid between *M. comosus* and *M. major*. It shows exactly intermediate characters. So far, the plant has failed to ripen seeds, but it has been grown again from seeds of *M. comosus*, and it may therefore be possible that it occurs in other gardens which have had seeds of *M. comosus* (or *M. minor*) from us.

M. intermedius is much more vigorous and taller than either parent. It has leaves the size of *M. major*, but less glaucous, the stipules are smaller, the petioles less broadly winged, again almost quite glabrous at the back and not tomentose, as in *M. comosus*. The inflorescences again are not quite so long, but exceeding the leaves in length, as in *M. major*, less curved at the top and almost as dull-coloured, but again longer than in *M. comosus*, where they are shorter than the leaves and also brighter-coloured. The bracts, pedicels, and flowers are exactly intermediate between the two species.

The plant is probably the first hybrid observed in this genus. A. B., La Mortola.

IMPATIENS KEWENSIS.

This is a hybrid which has been raised at Kew from *I. platypetala*, an old garden plant, and *I. Herzogii*, a new introduction from New Guinea, having the general characters of *I. Hawkeri* and flowers of the brightest orange-scarlet colour. The genus is a very large one, and many of the species are difficult to define. If *I. Sultani* and *I. Holtzii* are forms of one species, as some believe, then *I. Hawkeri* and *I. Herzogii* may be looked upon as forms of another, with *I. platypetala* close up to them. Be that as it may, by crossing *I. platypetala* with *I. Herzogii* we have obtained a hybrid which is a happy combination of its parents, the habit of the plant being good and the flowers large, showy and bright in colour. It is remarkable that by mixing a rosy-lilac with a bright orange the result is a hybrid with bright crimson flowers. There is a little variety of shade in the several seedlings, but they are all reds. The cross was effected by Mr. C. P. Raffill, who sowed the seeds in March, the first flowers opening in June. W. W.

† *MELIANTHUS INTERMEDIUS* BERGER NOV. HYBR. ex *M. comosus* × *major*, characteribus exacte intermediis, robusta, subglabra, folia fere forma eorum *M. majoris*, sed vix glauca et rhachide minus alata sultus secus nervos minute puberulis, stipulisque minoribus. Inflorescentiae foliis superantes erectae, floribus numerosioribus et majoribus quam in *M. comoso*, brunneis fere ut in *M. majore*; bracteis viridulis. In Horto Mortolensi ex seminibus *M. comosi* enata.

DENDROBIUM SCHUETZELI, ROLFE.

ANOTHER striking *Dendrobium* of the *D. Dearei* group has been introduced by Messrs. Sander & Sons, St. Albans, and will be described under the above name. It has very large white flowers, with obovate-orbicular petals, and a strongly three-lobed lip, the side lobes of which are broadly rounded, and the front lobe broadly obovate or nearly orbicular, with a distinct apicula. The petals and lip are much broader than in *D. Dearei* and very different in shape. It should prove a great acquisition to the ranks of cultivated *Dendrobiums*. *R. A. R.*

PHENIX ROEBELINII.

In the *Gardeners' Chronicle* for 1889, vol. vi., p. 475, there is a note from Mr. James O'Brien, together with a figure of a dwarf Phoenix, which had been sent to England by Mr. C. Roebelin, Orchid collector, of Manila, and sold by auction in Messrs. Protheroe & Morris's sale room. This identical plant is now in the Palm house at Kew. In the same volume, p. 758, there is also a note from Mr. Roebelin, stating that this Palm grew in great abundance along the rocky banks of the River Mekong in Siam, as far north as 22° latitude, where the temperature was sometimes as low as 41° Fahr., and that the stems never grew more than about 2 feet in height. He found thousands of young plants, but could get no seeds, owing, the native informed him, to the fondness of monkeys, &c., for the fruits. This Palm is now largely grown by nurserymen, who obtain their stock from imported seeds, and it has become a favourite table plant, a purpose for which the elegance of its leaves and comparative hardiness peculiarly fit it. Under cultivation, however, it grows taller than Mr. Roebelin saw it. The oldest specimen at Kew has six stems, and it is 6 feet high, the tallest and strongest stem being quite clear for 4½ feet and measuring 2 inches in diameter. The persistent basis of the old leaves have hardened and become blunt pointed, and they give the stem a "bossed" appearance. The largest leaves are 4 feet long, and there are about 100 pinnae on each leaf, those at the base being spinous, the others 10 inches long and ¼ inch wide, the keel rough with scaly hairs, narrowing to a long, elegantly-curved apex, giving the whole leaf the character of an ostrich feather. The pinnae are arranged about equidistant and in the same plane on the midrib, a character which is found in *P. rupicola* also. There is some variety in the width and curve of the pinnae, as shown by the several plants at Kew; still, there is no mistaking this for any other Phoenix; it is by far the most elegant species. The Kew plant is a male, and it has flowered several times. The plant, of which a portion bearing a male inflorescence is shown in the illustration, is in the collection of Mr. E. D. Preston, Beckenham. *W. W.*

AGRICULTURAL RESEARCH AND EDUCATION.

THE first report of the proceedings of the Development Commissioners for the period from May 12, 1910, to March 31, 1911, was issued on the 17th inst. We extract the following particulars respecting the manner in which applications had been met on March 31 last.

The Treasury forwarded to the Development Commissioners on September 2, 1910, an application by the Board of Agriculture and Fisheries for an advance of £50,000 per annum for the organization of a system to aid and develop agriculture by the provision of technical advice for farmers and by promoting scientific research and experiments in the science, methods and practice of agriculture. At a later date the Board estimated that an expenditure of £25,000 would be necessary for the financial year 1911-12. The Commissioners decided to recommend that the following grants, or such proportion as might be required for the financial year, should be paid to the Board for the purposes indicated:—

Cambridge University.—Research work	£4,000
Bristol University.—(1) Bio-chemical investigations on cheese; (2) investigations of teart land	500
Yorkshire Council for Agricultural Education (Leeds University).—Investigations of atmospheric impurities	210
University College, Reading.—General work on (1) Microflora of cheese; (2) cereal selection	250
South-Eastern Agricultural College, Wye.—(1) Investigations on Tobacco; (2) Mycological Department; (3) Entomological Department; (4) investigations on Hop resins	350
University College of Wales, Aberystwith.—Botanical survey of Aberystwith, and subsidiary inquiries	155

[Photograph by Rev. W. T. Gray.]
FIG. 19.—PHENIX ROEBELINII SHOWING MALE INFLORESCENCE.

Harper Adams Agricultural College.—Research on wart disease and finger and toe	190
Royal Veterinary College.—Investigations in respect of vaccination	1,390
The Incorporated Society for Extending the Rothamsted Experiments	2,000
The British Dairy Institute, Reading	60
Woburn Experimental Station	600

The Commissioners further intimated that they would be prepared to recommend additional interim grants not exceeding £3,000 to other institutions not at that time dealt with by the Board; also grants of £1,000 each for scholarships and expenses of administration when estimates, &c., were supplied to them. The Com-

missioners have stated to the Board that they are willing to contemplate an expenditure of £40,000 per annum for research alone. On March 2 the Commissioners intimated to the Board that they were prepared to recommend the Treasury to allocate £65,000 per annum for agricultural education in England and Wales.

SCOTLAND.

The Scotch Education Department forwarded to the Commissioners on January 12 an application for a sum not exceeding £140,000. The Commissioners informed the Department that they would be prepared to recommend the Treasury to grant a capital sum not exceeding £60,000 on the following conditions:—

- (1) That only one-half of the expenditure ultimately approved is defrayed from the Development Fund; the other half being met by fresh contributions of local authorities and persons interested, and by a contribution from the Education (Scotland) Fund (one quarter from each source).
- (2) That a revised scheme and estimates of expenditure relating to each individual college should be placed before the Commissioners for consideration, before they report to the Treasury.

They also informed the Department that they would be prepared to recommend an annual grant of one-half of the excess of the expenditure of the colleges on what may be called "extension" work (i.e., instruction to agriculturists in the colleges' provinces by such means as lectures, visits, etc., and similar work) over the corresponding expenditure of the year 1908-9, such grant not in any case to exceed £5,000.

IRELAND.

The Commissioners received on July 18, 1910, an application by the Department of Agriculture and Technical Instruction for Ireland for a grant of £15,000 a year for five years, for the establishment and maintenance of an agricultural station for a system of general investigation and scientific research in Ireland. It was proposed that the station should be established in the vicinity of Dublin, the capital expenditure being estimated at £20,000 and maintenance at £15,000 a year. The Commissioners considered the application, and determined to intimate that they would be prepared to consider schemes based on an expenditure of—

- (a) £4,000 per annum for a central institution for investigations and technical advice of a local character;
- (b) £5,000 per annum for scientific research in animal breeding or some other subject undertaken in Ireland as part of a general scheme of scientific research for the United Kingdom.

At the end of the year the Commissioners were awaiting an amended application on the terms thus indicated.

ORGANISATION OF CO-OPERATION AMONG AGRICULTURISTS.

The Commissioners received on September 3, 1910, an application from the Board of Agriculture and Fisheries for an advance of £20,000 per annum for the organisation of co-operation among agriculturists in England and Wales.

The Scottish Agricultural Organisation Society also applied for a grant not exceeding £1,500 per annum, and the Agricultural Organisation Society for England and Wales made a request for an annual grant of £13,704 (together with a capital sum of £250) to meet the cost of a scheme of complete reorganisation of its work. The Commissioners ultimately decided to propose a scheme for the constitution of a representative association, possibly based upon a reorganisation of the existing society, to which might be entrusted the expenditure of the sums required for the energetic promotion of co-operation; and meanwhile to make to the society an interim grant of perhaps £3,000 to enable it to carry on its work, of which the Commissioners desire to express a high opinion. The Commissioners have not yet definitely considered a recommendation in regard to Scotland, and an application expected from the Irish Agricultural Organisation Society had not reached the Commissioners at the end of the year.

THE FLOWERS OF CHAUCER.

(Continued from page 25.)

BEAN.

1. This Absolon ne roughte nat a bene
Of al his pleye. *Miller's Tale*, I. 213.
2. But natheles I recche nat a bene.
Man of Lawes Tale, II. 8.
3. "Noon other lif," sayd he, "is worth a
bene." *Marchaundes Tale*, II. 163.
4. Sche praysith nought his pleying worth a
bene. *Marchaundes Tale*, II. 182.
5. If he wil serve the, rek not a bene.
Nonne Prest's Prologe, III. 215.
6. Lippes thin, not fat, but ever lene,
They serve of naught, they be not worth
a bene. *Court of Love*, IV. 159.
7. Suche argumentis ben not worthe a bene.
Troilus and Cryseyde, V. 156.
8. God helpe me so, I counte hem nought a
bene. *Ib.*, V. 249.
9. I yeve not of her harme a bene.
Romaunt of the Rose, VII. 218.
10. Syn I am fre, I counte him not a bene.
Minor Poems, VIII. 150.

The Bean was in Chaucer's time the proverbial example of worthlessness.

BEECH.

1. Mapul, thorn, beech, hasil.
Knights Tale, I. 182.
 2. Bycause oure fuyr was nought y-maad of
beech.
Prologue of the Chanounes Yeman, III. 36.
 3. This false chanoun
Out of his bosom took a bechen cole.
Chanounes Yemannes Tale, III. 45.
 4. And whan that the chanounes bechene cole
Was brent. *Ib.*, III. 46.
- Chaucer's Beech requires no comment.

BIRCH.

- Look, fyr, birch, asp.
Knights Tale, I. 182.

BITTER SWEET.

For unto hem it is a bitter swete.
Prologue of the Chanounes Yeman, III. 35.

The bitter-sweet was an Apple, sweet at first, but leaving a bitter taste. It is often named by mediæval writers as an emblem of the after bitterness of forbidden pleasures, and there is little doubt it was founded on Solomon's description: "Her lips drop as an honey-comb and her mouth is smoother than oil, but her end is bitter as wormwood."

BLACKBERRY.

Though that here soules gon a blakeberyed.
Prologue of the Pardoner, III. 71.

"Blackberries — wandering astray." — Skeat.

BOX.

1. The box-tree, or the asschen deed and colde.
Knights Tale, I. 130.
2. Elm, plane, assch, box. *Ib.*, 182.
3. Of bras thay broughten hornes and of box.
Nonne Prest his Tale, III. 233.
4. The boxe pipe tree.
Assembly of Foules, IV. 195.
5. And pale as boxe she wax.
Legende of Goode Women, VIII. 72.

It is curious that though the Box is a native tree, and was always a favourite, it never has had a British name. Box is merely the Anglicised form of the Latin *Buxus*. How Chaucer can have called it "pale" can only be explained by supposing that he closely copied Ovid—*Oraque buxo pallidiora gerens*. *Metam.* II. 134.

BRAMBLE.

And sweet as is the brembre flour
That bereth the reede heepe.
Tale of Sir Thopas, III. 119.

Brembre is an archaic form of Bramble.

BRIAR.

1. Now in the croppe, now down in the breres.
Knights Tale, I. 137.

2. Lik to the skyn of houndfisch, sharp as
brere. *Marchaundes Tale*, II. 181.
3. That leten her schep wityngely go renne to
the wolf, that is in the breres.
Persones Tale, IV. 68.
4.
hir flesh so tendre,
That with a brere smale and slendre
Men myght it cleve.
Romaunt of the Rose, VII. 41.
5. Netles, thornes, and hokede breres.
Ib. 69.
6. Ther were also thisteles thikke,
And breres brymme for to prikke.
Ib. 72.
7. It is not worth a croked brere. *Ib.* 209.

In the oldest English briar was the name of the Rose bush, and so it remained for many years, but in all these passages Chaucer means any wild thorny bush.

BROOM.

Ther lakkide no flour to my dome,
Ne nought so mych as flour of brome.
Romaunt of the Rose, VII. 43.

This is the beautiful flower of our wild Broom.

BULLACE.

Notes, aleys and bolas.
Romaunt of the Rose, VII. 59.

The bullace is the fruit of the Wild Sloe, but the name is often given to the better cultivated Plums.

CATAPACE.

Of catapus, or of gaytre beriis.
Nonne Prest his Tale, III. 220.

Catapace is the old name for the lesser Spurge. It is obsolete in England, but still exists in French and Italian.

CEDAR.

1. A nyghtyngale upon a cedre grene
* * * * *
Ful lowde song agen the mone shene.
Troilus and Cryseyde, V. 88.
2. Pyn trees, cedres, and oliveris.
Romaunt of the Rose, VII. 57.
3. The cedres high, upryght as a lyne.
Complaynte of a Lovers Lyfe, VIII. 8.

I should think it certain that Chaucer never saw a living Cedar, but it had its place in English literature long before his time, chiefly in translations from the Bible.

CENTAURY.

Ye take your laxatives,
Of lauriol, century, and fumytore.
Nonne Prest his Tale, III. 220.

Centaur is the translation of *Erythraea Centaurium* and other plants of the Gentian family. It had a high character in mediæval medicine, and was named after the Centaur Chiron, the reputed discoverer of the plant and its virtues.

CETIVALL.

1. He himself as swete as is the roote
Of lokorys, or eny cetewale.
Miller's Tale, I. 192.
2. Ther springen herbes greet and smale,
The licorys and the cetewale.
Tale of Sir Thopas, III. 119.
3. Canelle, and setewale of prys.
Romaunt of the Rose, VII. 58.

Setwall, spelt in many different ways, is the Valerian. It is still a popular medicine among country herbalists.

CHERRY.

Cherys, of which many oon fayne is.
Romaunt of the Rose, VII. 59.

CHESTNUT.

1. Medlers, plowmes, perys, chesteyns.
Romaunt of the Rose, VII. 59.
2. Box, chesteyn, lynde, laurer.
Knights Tale, I. 182.

Chaucer's Chestnut was what we now call the Spanish Chestnut (*Castanea Sativa*).

CINNAMON.

1. My fayre bryd, my swete cynamome.
Miller's Tale, I. 211.

2. Canelle, and setewale of prys.
Romaunt of the Rose, VII. 58.

Canel or Cannelle is the French name of Cinnamon. Chaucer could only have known of it from the imported Spice, but as he names it in a list of trees I cannot omit it.

CLOTE.

A cloote-leef he had under his hood
For swoot, and for to kepe his heed from
hete.

Prologe of the Chanounes Yeman, III. 25.

The clote or clote-bur is the leaf of the great Burdock.

CLOVE. See Gilliflower.

COCKLE.

He wolden sowen som difficultee,
Or springen cockle in our clene corne.
Schipmannes Prologe, III. 91.

Cockle in the old writers stands for almost any noxious weed in cornfields, and the opposition between Corn and Cockle as emblematic of the opposition between good and bad is a favourite illustration. Of course the origin of the proverb is in the Gospel parable of the Tares and Wheat.

COLUMBINE.

Come forth now with thin eyghen columbine.
Marchaundes Tale, II. 190.

I quote this because it is the name of a flower, and some have supposed the flower is meant, but I have no doubt it only means dovelike.

CORN. See Wheat.

COYNES. See Quinces.

CYPRESS.

1. His spere was of fine cipres.
Tale of Sir Thopas, III. 125.
2. The cipres dethe to plaine.
Assembly of Foules, IV. 195.
3. With cipres, and with olyvers.
Romaunt of the Rose, VII. 59.

Cypress was early introduced into English literature, and was probably grown in English gardens in Chaucer's time.

DAISY.

1. Whit was his berde, as the dayesye.
The Prologue, I. 92.
2. With many a thousand daisies, rede as rose,
And white also, this saw I verily.
Court of Love, IV. 133.
3. The ground was green, ypoudred with daisie.
Cuckow and the Nightingale, IV. 221.
4. Go looke upon the fresh daisie,
And, though thou be for wo in point to die,
That shal ful greatly lessen thee of thy pine.
Ibid., IV. 228.
5. A lady for to singe right womanly
A bargaret in praising the daisie.
The Flower and the Leaf, IV. 250.
6. Of al the floures in the mede,
Thanne love I most these floures white and
rede,
Suche as men callen daysyes in our toune.
Legende of Goode Women, VIII. 45.

(For fifty lines following this, Chaucer tells of his love for the Daisy.)

7. The longe day I shoope me for tabide
For nothing elles, and I shal nat lye,
But for to loke upon the daysie;
That men by reson wel it calle may
The daisie, or elles the ye of day,
The emprise, and floure of floures alle.
Ib., VIII. 50.
 8. The gret goodnesse of the quene Alceste,
That turned was into a dayesye.
Etc., etc. *Ib.*, VIII. 61.
 9. In a Goodly Ballade of Chaucer the daisy
is frequently mentioned, but only as an
emblem of the Duchess Margaret of Pem-
broke and a translation of her name.
- Chaucer's admiration of the Daisy entitles him to be called the poet of the flower. Among the many references to it I have only quoted those which may, to some extent, be called descriptive. *H. N. Ellacombe, Bitton Vicarage, Bristol.*
(To be continued.)

INJURIOUS INSECTS AND PLANT DISEASES. LEGISLATION IN CANADA.

(Concluded from p. 22.)

REGULATIONS

Issued under the Destructive Insect and Pest Act,
(By Order in Council of February 27, 1911.)

1. "Inspector" means a person appointed for carrying out the provisions of the Destructive Insect and Pest Act and the regulations made thereunder.

2. No tree, plant or other vegetation or vegetable matter infested with any of the insects,

Windsor, Ont., and St. John's, P.Q., from March 15 to May 15, and from September 26 to December 7.

At these points of entry the importations shall be fumigated in the fumigation houses provided for that purpose, and a certificate of fumigation will be issued, without which no stock may be taken out of bond.

Importations by mail shall be subject to the same regulations.

All nursery stock originating in Japan or in any one of the States of Vermont, New Hampshire, Maine, Massachusetts, Connecticut and Rhode Island, six of the United States of

(b) Herbaceous perennials (the stems of which die down in winter), such as perennial Phlox, Pæonies, Sunflowers, &c.

(c) Herbaceous bedding plants (such as Geraniums, Verbenas, Pansies, &c.).

(d) Bulbs and tubers (such as Hyacinths, Lilies, Narcissi, and other true bulbs, and also the tubers of Dahlias, Irises, &c.).

(e) Cottonwood or Necklace Poplar (*Populus deltoides*) when shipped from and grown in Dakota or Minnesota, two of the United States of America.

4. The port by which it is intended that the nursery stock shall enter shall be clearly stated on each package and all shipments made in accordance with these Regulations will be entirely at the risk of the shippers or consignees, the Government assuming no responsibility whatever.

5. All persons importing nursery stock, except such as is exempt from fumigation or inspection under Section 3 of these Regulations, shall give notice to the Dominion Entomologist, Experimental Farm, Ottawa, within five days of despatching the order for the same, and they shall again notify the Dominion Entomologist on the arrival of the shipment in Canada.

Notice shall also be given to the Dominion Entomologist by all transportation companies, Custom House brokers, or other persons importing or bringing into Canada nursery stock that is subject to inspection as hereinafter provided, immediately such a consignment is received by them. Such notice shall include the name of the consignor and the consignee, the points of origin and destination, the name of the company carrying the nursery stock, as well as the nature, quantity and origin of the same.

6. Nursery stock, not including such stock as is exempt under Section 3 of these Regulations, originating in Europe, shall be imported only through the ports and during the periods specified under Section 3 for stock requiring fumigation, with the addition of the ports of Halifax, N.S., Sherbrooke, P.Q., and Montreal, P.Q., through which ports such European stock may enter from September 15 to May 15. Such European nursery stock, and such other imported vegetation, as the Minister may determine, entering Canada, shall be exempt from fumigation, but shall be inspected either at the port of entry or at its destination to which it may be allowed to proceed, but in the latter case it must not be unpacked except in the presence of an inspector.

7. If, on inspection, nursery stock or other vegetation or vegetable matter is found to be infested with any of the insects, pests or diseases hereinafter specified, it shall be destroyed to the extent deemed necessary by the inspector and in his presence. All cases, packages and packing in which such stock has been contained shall also be destroyed in the same manner.

8. Any inspector entering any lands, nursery or other premises where there is reason to believe that any of the insects, pests or diseases hereinafter specified are or may be present, shall give instructions for the treatment or destruction of any tree, bush, crop or other vegetation or vegetable matter or the containers thereof, which may be found or suspected to be infested with any of the insects, pests or diseases hereinafter specified, and such instructions shall be carried out by the owner or the lessee of the infected or suspected vegetation, vegetable matter or containers thereof, and such remedial treatment shall be carried out and continued until the insect, pest or disease shall be deemed by the inspector to have been exterminated.

9. Compensation not exceeding two-thirds of the value as assessed by the Inspector, of the vegetation or vegetable matter or containers thereof destroyed by the instructions of an Inspector, shall be granted by the Governor in Council upon the recommendation of the Minister.

10. It shall be illegal to sell, offer for sale or in any way dispose of or receive any trees,

FIG. 20.—PELARGONIUM LORD BUTE: FLOWERS MAROON EDGED WITH ROSE.

Awarded R.H.S. Award of Merit at the Olympia Show when exhibited by Mr. W. Treseder, Cardiff (see p. 17).

pests or diseases to which this Act applies, shall be imported into Canada except as hereinafter provided.

3. Nursery stock, including all trees, shrubs, plants, vines, grafts, scions, cuttings or buds which are not hereinafter exempted, entering Canada shall be imported only through the ports and during the periods respectively hereinafter mentioned, that is to say:—

Vancouver, B.C., from October 1 to May 1.
Niagara Falls, Ont., from October 1 to May 15.
Winnipeg, Man., and St. John, N.B., from March 15 to May 15 and from October 7 to December 7.

America, shall, after fumigation, be subject to inspection as provided by Section 6 of these Regulations.

Provided, however, that the following vegetation and florist's stock shall be exempt from fumigation and may be imported at any season of the year and through any port without inspection.

(a) Greenhouse-grown plants, including Roses in foliage which have been grown in pots up to 3 inches in diameter but not larger. A certificate that the plants have been grown under glass must accompany the invoice and shall be signed by the consignor.

shrubs, or other plants, vegetable matter or portions of the same, if the same are infested with any of the insects, pests or diseases hereinafter specified.

11. The owner, occupier or lessee of any premises or place where any of the insects, pests or diseases specified herein shall be found, shall immediately notify the Minister and shall also send to him specimens of such insects, pests or diseases.

12. The destructive insects, pests and diseases to which the said Act shall apply shall include the following:—

The San José scale (*Aspidiotus perniciosus*).
The Brown-tail moth (*Euproctis chrysorrhæa*).
The woolly aphis (*Schizoneura lanigera*).
The West Indian Peach scale (*Aulacaspis pentagona*).
The Gypsy moth (*Porthetria dispar*).
Potato canker (*Chrysophlyctis endobiotica*).
Parasitic diseases affecting Potatoes externally or internally.
Branch or stem canker (*Nectria ditissima*).
Gooseberry-mildew (*Sphaerotheca mors-uvæ*).
White Pine blister rust (*Peridermium strobi*).

13. The importation of Potatoes into Canada from Newfoundland or the Islands of St. Pierre or Miquelon is prohibited.

14. The Minister may, upon special request to that effect, authorise the importation into Canada of any insect, pest or disease hereinafter specified, but for scientific purposes only.

15. The Regulations made under the San Jose Scale Act are repealed. C. Gordon Hewitt, D.Sc., Dominion Entomologist, Ottawa.

THE PRIMULAS OF THE EUROPEAN ALPS

(Continued from p. 24.)

SUBSECTION 7.—*Chamæcallis*.—This subsection needs no descriptive note, as it contains but one species, and that the unmistakable *P. minima*. *P. minima* is a tiny plant; the leaves are some half an inch to an inch long, glossy dark-green, almost glabrous, firm, hard and leathery, without membranaceous margin; they are wedge-shaped (either broad or narrow), abruptly truncated, and sharply serrate. The scape is short or minute, shorter than the leaves, as a rule, and producing one or two flowers. These are of a bright rose-pink, white-throated, their lobes more or less deeply cloven, and of such size as to hide the rosette upon which each seems to lie (in one rare variety, *P. m. fimbriata*, the corolla lobes are gashed and ragged). *P. minima* is a species of the highest Alpine moorlands, whether on limestone or granite; its range begins in Thrace, and it reaches westward through Servia and Bulgaria to the Alps of Central and Southern Austria. (Heiligenblut!). It forms wide lawns, on which so thickly lie scattered the great stemless rosy flowers that one hardly likes to tread.

In cultivation it is too small and choice to be always found easy. My own personal theory is that all these lawn-forming high-Alpines greatly dislike careful cultivation in some isolated corner of the rockwork. I believe them to be very largely symbiotic, and their health to depend greatly on company. Accordingly, in prepared ground, of a sanded, peaty loam, cool but perfectly drained, I should plant such things as *P. minima* and its hybrids, with *Gentiana verna*, *brachyphylla*, *Favrati*, *Frœlichii*, *pumila*, *Rostani*, &c., all in a dense association, only an inch or two apart, to form a close matting, in which each plant's roots should assist its neighbours.

With *P. minima* ends, then, the list of European species belonging to the Alpine section *Auricula*. Now that the species have been dealt with, it only remains for us to cope with the hybrids, whose multiplicity has long bred confusion in catalogues and a costly curiosity among collectors. Reginald Farrer.

(To be continued.)

ROCK-GARDEN AT WISLEY.

AMONGST the latest additions to the gardens of the Royal Horticultural Society, at Wisley, is a large rockery, which is now nearing completion. This rock-garden (see figs. 21 and 22) is being built by Messrs. Pulham & Son on a natural bank, with a north-west aspect, rising

bridge in the "wild" garden, looking up a ravine, through which flows a stream, with waterfalls, and crossed at various points by paths or stepping-stones. The stream issues from a fissure in the rock, tumbling down a cliff 15 feet high, and leading, by a series of waterfalls, to a large pool, and from thence gradually, by more falls, to the Lily-ponds below. The supply of water is

FIG. 21.—ROCK-GARDEN AT WISLEY: SHOWING THE ARRANGEMENT OF THE STONES NEAR THE SUMMIT.

from the "wild" garden to a height of 50 feet. The work has entailed much excavating of the hillside (see fig. 21) in order to procure a suitable undulating surface in which to arrange the stones in a natural manner. The rocks are composed of Sussex sandstone, some of the blocks weighing as much as 2 tons each. The finest view will be obtained from the old rustic, Wistaria-covered

obtained from a well in the lower grounds, and is pumped by a petrol engine to a reservoir at the highest point of the rockery. The top of the rockery may be reached by the main Rose walk, and the descent may be made by several winding pathways through the rockery. A large moraine forms one of the chief points of interest, and below this is a bog-garden, watered from the

FIG. 22.—ROCK-GARDEN AT WISLEY: SHOWING THE SITE OF THE WATER-COURSE AND ONE OF THE CASCADES.

same source which supplies the moraine. A cave, with water, dripping into a small pool, from a natural spring, discovered during the excavations, is another pretty feature. Moisture and shade-loving Ferns are already planted in the cave, and all the completed parts of the rockery are being furnished with plants as quickly as possible. The area covered by the rockery is about 2 acres. The view from the top of the rockery includes a panorama of the gardens, with the Pine woods of Wisley Common in the background. It is only necessary to remove a few trees in order to open up another fine landscape to the left of that already mentioned.

NOTICES OF BOOKS.

THE LIBYAN FLORA.*

THE work, of which the full title and description are given below, is an important and valuable contribution to geographical botany, due to the enthusiasm of the late Dr. Ernest Durand and several other botanists whose names appear in this work. It fills a gap between the countries included in Cosson's *Compendium Floræ Atlantice* and Boissier's *Flora Orientalis*, and is a most interesting connecting link, covering the country between Tunis on the west and the Egyptian Marmarica to the east. Neither the primary nor the secondary title is quite descriptive, but the geographical divisions adopted in the work give a better idea of the area under consideration. These are:—Tripoli, Fezzan, Kufra, Aujila, Cyrenaica (Barca), and Turkish Marmarica, extending through about 15° of longitude and 8° of latitude, from the sea nearly to the tropic. Sir R. Lambert Playfair's map to the *Bibliography of the Barbary States* is the only one given, and it is not satisfactory, as the divisions are not indicated, and there is no explanation. A suitable one would probably have been compiled had Dr. E. Durand, the principal editor, lived.†

The whole area is nominally under Turkish rule, but the natives of certain parts are practically independent, and they are hostile to foreigners. Partly on this account, and partly from the absence of roads, many districts are still imperfectly known, more especially the remote groups of oases. Many botanists and travellers have contributed materials and data elaborated in the present work, including such well-known persons as Ascherson, Schweinfurth, Rohlfs, Taubert, and Nachtigal. British contributors include Beechey, Denham and Clapperton, Dickson, Oudney, Richardson, Ritchie, Scott Elliot, and Wilkinson. Dr. Ascherson's brief summary of the labours of the various explorers is full of interesting facts, many little known, and some new.

From the chapter on the physical geography we learn that the greatest altitudes are from 1,000 to about 3,000 feet, while some districts in the interior are considerably below the level of the Mediterranean Sea. Immense areas are absolutely bare of vegetation. The rainfall is very small, or none, and shade temperatures of 100° to 110° are not uncommon.

The total number of species of flowering plants and Ferns recorded for the whole region is about 1,025, of which 64 are endemic, and these are, almost without exception, herbaceous plants.

* *Flora Libyæ Prodromus ou Catalogue Raisonné des Plantes de Tripolitaine*, par E. Durand et G. Barratte avec la collaboration de Paul Ascherson, William Barbey et Reinhold Muschler, et avec un Aperçu Géologique sur la Tripolitaine par Stanislas Meunier. One volume, 4to, pp. cxxvii. + 830, with a map, 20 lithographed plates, very elaborate tables illustrating the general geographical distribution of the plants composing the flora, and a copious bibliography, with notes by Dr. Ascherson on the publications of the principal travellers who have investigated the flora. (Geneva: Imprimerie Romet, Frères Successeurs.) 1910.

† In this connection it may be mentioned that Dr. Durand was a grandson of Cosson, whose valuable herbarium and botanical library he inherited and finally bequeathed to the Paris Museum. We understand the work under notice was published mainly at his expense and it has been distributed gratuitously by his sister—Madame Jeanne Gallice, of Juan les Pins, Alpes Maritimes.

Specially interesting among the endemic plants are *Reseda odorata*, *Viola scorpiurioides*, *Hypericum Decaisneanum*, *Athamanta Della Cella*, *Perralderia Garamantum*, *Cyclamen Rohlfsianum*, *Phelypæa compacta*, *Orobanchè cyrenaica*, several species of *Teucrium*, *Orchis cyrenaicus*, and *Ornithogalum Barba Capræ*. Not the least interesting is *Reseda odorata*, *Mignonette*, the native country of which was unknown until Dr. Taubert discovered it in Cyrenaica in 1887. The authors state that it is closely allied to *R. arabica* of Boissier, differing in the lateral lobes of the two large petals being divided almost to the base, in the deciduous filaments, and in the ovary being constricted at the base into a short stalk. The flora of the remotely-isolated groups of oases Kufra and Aujila is exceedingly poor, only 14 species being known from the former, and 20 from the latter, and there are no peculiar species. But it is not supposed that they have been exhaustively botanised. The population of Kufra is estimated at 700 and the number of its Date Palms at about a million. Aujila, in proportion to its area, is much more thickly populated, numbering some 12,000 inhabitants, and the number of Date Palms cultivated is given as 200,000. The Dates of these oases and of Fezzan are reckoned the best, and the varieties are very numerous. It is estimated that in Fezzan alone 300 varieties are cultivated. The Doum Palm (*Hyphæne*) was reported as growing in the oasis of Tedjerri, South Fezzan, by Lyon and by Denham, but recent travellers make no allusion to its presence, and the nearest known station for it is in the oasis of Yat, in about 20° 30' N. lat. *Chamærops humilis* was recorded as growing in Tripoli by Della Cella, 1817, but it has not been observed by subsequent travellers. The plates mostly represent endemic species, and they are excellent specimens of lithography by the well-known artist d'Apreval. W. B. H.

APPLES AND PEARS.*

THIS work is a valuable addition to the "Present-Day Gardening" series, and it is beautifully illustrated with eight coloured plates of notable varieties of Apples and Pears. The author, well known as a fruit nurseryman and one of the most successful exhibitors of fruit in this country, commences his book with an interesting history of Apples and Pears as grown in Great Britain, showing, amongst other things, how modern is our present system of market growing. The rest of the work is full of such practical instructions as only a grower of wide experience is capable of giving from his own knowledge. Some relate to the choice of positions for planting and the varieties which succeed best in different aspects; advice which is very useful for private gardens and orchards, in reference to which such points can be considered. But in any extent of planting the advice as to avoiding situations exposed to the north or east is applicable, except that early Pears on walls, the author says, should face the east, as they ripen too fast when the aspect is south or west. The chief recommendation as to soils is that of avoiding a stiff clay and a drier soil over chalk. The directions as to the preparation of the land for planting are of the usual description, while those relating to planting are more elaborate than most growers on a large scale are disposed to adopt. Mr. Bunyard is a strong advocate of the plan of leaving Apple and Pear trees for a year after planting before cutting them back, and, although he allows that dwarf trees planted before Christmas may be pruned in the following April, he insists on the advantage of leaving them alone for a year. "Trees pruned on planting," he says, "form little growth but plenty of fruit spurs, and these prevent a good sound foundation being laid for a vigorous tree." It is curious to notice

* By George Bunyard, V.M.H.; edited by R. Hooper Pearson. (London and Edinburgh: T. C. and E. C. Jack.) Price 1s. 6d.

that advocates of cutting back in the fruit season give precisely the same reason for objecting to the postponement of the operation, declaring that the premature formation of fruit-buds results from leaving the young branches uncut until the second year. Other remarks on pruning are not likely to occasion controversy. While root pruning is recommended for bush and pyramid trees which make wood growth in excess, to the delay of fruiting, warning is given against the similar treatment of standard trees, as this would diminish their grip of the soil, and render them liable to be blown down by gales. The selected lists for Apples and Pears for large and small orchards respectively will be found valuable, and all the more so in consequence of the inclusion of a description of each variety and its time of ripening. There are separate lists of late keepers, of Apples suitable for northern districts, of Apples and Pears for orchard houses and pot culture, and for cordons. The sections relating to insect and fungous pests and their prevention and destruction by spraying and otherwise are the least complete and satisfactory of any in the book, but that subject is so elaborate that its proper treatment requires a large work to itself. The thinning, gathering, grading, packing, and marketing of Apples and Pears, and the storing of keeping varieties receive careful attention, also grafting and budding. The calendar of orchard work will be found useful as a reminder when special operations have to be carried out, and housekeepers will be pleased with a remarkably full list of recipes for Apple cookery, many of which are not at all commonly known. This notice of the principal divisions of the book gives no adequate idea of the multitude of valuable suggestions which it contains. It should command a large circulation, not only among amateur gardeners, but also among professional fruit growers. *A Southern Grower.*

EUROPEAN NURSERY CONDITIONS.

THE following critical account of European nursery conditions appears in *Farmers' Bulletin*, No. 453, issued by the U.S. Department of Agriculture, and dealing with "The Danger of Spread of the Gipsy and Brown-tail Moth through Imported Nursery Stock."

During the summer of 1909, and also again in 1910, Dr. Howard, who was in Europe principally to supervise the introduction of parasites for the gipsy and brown-tail moths into Massachusetts, made a careful inspection of the nursery regions of Holland, Belgium, and northern France, and also Germany.

The writer was in Europe, on a personal trip, in the summer of 1909, and made an examination of similar conditions in Holland, Belgium, and parts of Germany.

Holland probably presents the cleanest bill of health in the matter of insect pests, and particularly of the gipsy moth and brown-tail moth. This country enjoys a good inspection service, and all Dutch nurseries are carefully inspected twice each year, so there is probably less danger now from shipments from Holland than from any other country.

Belgium, in 1909, was in very bad condition, and the writer found the brown-tail moth more abundant there than he had ever seen it, hedge rows often being plastered with the winter nests. One such row, the writer noted, was only a few miles from the border of Holland, and within easy flight of the moths to large Dutch nurseries. Belgium has, however, since September, 1909, established an inspection service, applying only to nurseries exporting to America, and limited to field examination, twice yearly, of growing stock. While a distinct improvement, the inspection as indicated is still inadequate, as shown by much infested stock still coming to this country under official certificate.

In France, in 1909, Dr. Howard found no governmental inspection system of nurseries.

The certificates attached to shipments of nursery stock received in this country from France were signed, as a rule, by men connected with agricultural schools, and probably, in the case of most of the certificates, the stock had never been seen by the expert. The general infestation of the stock coming from France to this country during the last two years made it abundantly plain that these certificates were absolutely valueless.

Dr. Howard found that nursery stock for export was, in many cases, grown in the vicinity of hedges and trees infested with the brown-tail moth and gipsy moth and other injurious insects not yet introduced into the United States, and no special precautions were being taken by the nurserymen to prevent the infestation of export stock by injurious insects. The brown-tail moth nests are so characteristic and noticeable that it is only by absolute indifference on the part of French exporters that they are packed for shipment without removal.

As a result of the agitation of 1909, the French exporters promised to take all possible precautions, and the French Ministry of Agriculture promised to found a governmental inspection service. The Chamber of Deputies, however, failed to pass the inspection law proposed by the Ministry of Agriculture, and, as already noted, the condition of the "inspected material" of 1910 was no better than in the previous year.

The director of agriculture of France, however, continued to urge the need of a plant-inspection service for export nursery stock, and early in November of 1910 this Department was advised, through the Department of State and the Ambassador of France to the United States, of the final establishment of such service. Later, the details of the law were communicated to Dr. Howard by Dr. Paul Marchal, who is charged with its execution.

Dr. Marchal's high reputation gives a guarantee of thoroughness, and a great improvement has actually taken place in the condition of the nursery stock coming from France. The severe infestation of 1909-10 has given place to moderate infestation of 1911, but there is still decided room for betterment.

In England, Dr. Howard found that, as in France, there was no governmental nursery inspection. The nursery conditions there are somewhat better than in France, but the brown-tail moth and other injurious insects, which might easily be imported on nursery stock, occur in England. The officials of the Government had the establishment of a governmental inspection service under consideration, and were willing to establish such a service, but stated that the demand for it must come from British nurserymen. An attempt was, therefore, made by Dr. Howard to get the nurserymen to ask for such service, and, while no action has yet been taken, it seems probable that the English Government will move in this direction.

ADENIUM OBESUM.

THE plant of *Adenium obesum* (syn. *Nerium obesum*), reproduced in fig. 23, is growing in the Empress Botanical Gardens, Poona, India. Mr. P. G. Kanetkar, to whom we are indebted for the photograph, states that the plant flowers and fruits every year in the gardens at Poona. The species, which is very rare in gardens, has a thick, gouty stem, rapidly diminishing to short, stout branches, which, during the hot season (March to May in the Bombay Presidency), are gay with numerous rosy-coloured Oleander-like flowers. The individual blossoms measure 2 inches across, and have very short stalks. During the rainy season, oblong, shining, leathery leaves appear crowded at the ends of the branches. *Adenium obesum* is a native of the sunburnt rocks of Aden.

THE ROSARY.

CULTURAL NOTES FOR JULY.

CONSTANT attention in tying and staking must still be given to "maiden" plants. Continue to thin out the side buds of all but the cluster types of Roses. Roses trained on walls and arches should be given copious waterings, and thorough syringings at night with clear water. Climbing Roses are more effective when the shoots are spread out, so that the trusses of bloom show to advantage, and this applies particularly to varieties of the *Wichuraiana* and climbing *Polyantha* types.

BUDDING ROSES.

July is the best month for budding Roses, although the work may be continued until the end of August. The operation is a very simple one. Both stock and bud should be in a suitable condition, and the operation done cleanly and quickly. In the case of standards, buds are inserted in from two to four side shoots, and it is well to select branches that are opposite, or that form a triangle with each other. If the directions in my previous advice have been followed,

black, another should be inserted as near to it as possible. Avoid cutting away any growth from the stock just previous to inserting the buds, as this will check the flow of sap for a few days, with the result that the bark will not lift easily. If mildew puts in an appearance, use a weak solution of Cyllin soft soap freely.

ROSES UNDER GLASS.

The main batch of Roses in pots should be afforded all the air possible, half plunging them in the open, placing a layer of soot at the bottom of the hole to deter worms from entering the drainage holes. If they are plunged in soil, on concrete or cement bottom, this will not be necessary; but in other cases worms are certain to gain access if precautions are not taken. Afford the plants a sunny position, and see that they are not over-watered when the wood begins to mature. The present time is equivalent to autumn as regards pot Roses that are intended to be forced early, and they need a period of rest. This applies to all Roses with the exception of *Wichuraiana* varieties and extra strong standards which must not be checked, but encouraged to make growths of considerable length. These may be helped by a free use of liquid manures. A little judi-

FIG. 23.—ADENIUM OBESUM FLOWERING IN THE EMPRESS BOTANICAL GARDENS, POONA: FLOWERS ROSE-COLOURED.

and only the most favourably-placed growths allowed to develop, they should be in a good condition for budding during the present month. As a rule, the bark of dwarf stocks may be lifted easily for a much longer time than in the case of standards, unless the shoots of the latter have been stopped when about 2 feet long. If the prickles may be snapped off easily it is a fairly good guide for the time to commence budding. Much damage is often done by inserting the point of the budding knife too deeply, thus harming the wood beneath. As far as possible, the bud should be in the same condition of growth as the stock, and the small portion of wood at the back of the bud should always lift easily. Readers will be well acquainted with the operation as a whole, but much depends on getting it done quickly, and seeing that no part is dried or bruised. Many buds fail to grow through careless tying. It is especially necessary to secure the bud firmly and well down upon the wood of the stock. The tie may be loosened later when the bud and stock have united. Should the bark not lift easily, water the plants well, and try again in a week's time. Choose the buds from healthy plants that have produced the best flowers; also, when budding climbers, select those from the more vigorous shoots. If the bud in course of time appears

cious pruning should be practised to encourage the plants to make a number of long growths rather than a quantity of bushy wood, cutting away most of the shoots that have already flowered. Cuttings rooted under glass may now be potted on, but great care is needed not to break or bruise the roots. A compost consisting of leaf-soil and loam, with a very little coarse sand added, will be suitable. After potting, they may be given the same treatment afforded established plants; but shade and syringe them for a time until they have recovered from the disturbance. Roses in pots that were budded in the spring may have the stocks cut back to the bud to encourage the latter to develop. By this treatment they will make wood that will be of more service than a dormant bud when growing them on next spring. Practice.

GARDEN PARTY AT PRESTED HALL.—Mr. N. N. SHERWOOD, of Messrs. HURST & SON, entertained a large party on Saturday last at his beautiful place near Kelvedon. The primary object was to give Messrs. HURST's staff an opportunity for their annual cricket match and sports, but Mr. SHERWOOD extended the invitation to a large number of friends. The party numbered nearly 300, and, favoured with fine weather, everything passed off most successfully.

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

GLOBE ARTICHOKEs which have finished their crop should have the old stems removed, and, if the weather continues dry, a good watering at the roots should be given. Plantations made this spring should also receive liberal waterings.

LATE PEAS.—The latest-sown Peas will be ready for the sticks to be placed in position, and this should be done without delay. The ground between the rows may be mulched with a layer of farmyard manure, and afterwards receive a thorough drenching of clear water, which will keep the ground cool and moist, thus lessening the danger of mildew attacking the plants. If the weather continues dry, the crops of Peas generally will benefit by this treatment.

SCARLET RUNNERS.—Scarlet Runners should receive the same treatment as recommended for Peas. If farmyard manure is available, a thorough mulching and subsequent watering should be given as soon as possible. Stop the growths frequently when the plants have reached the top of the sticks, in order to promote the growth of side shoots and flowers.

SPINACH.—A good sowing of winter Spinach should be made now, and another at 10 days later. Ground from which an early crop of Peas has been cleared should be selected for these sowings. Fork the soil lightly, and make it as fine as possible before the drills are drawn at 18 inches apart. If the ground is dry, water should be poured into the drills the night previous to sowing the seed. When the young plants are large enough, they should be thinned to 3 inches apart. Later, stir the surface soil frequently with the Dutch hoe to promote a loose layer of dry earth on the top, which is the next best thing to mulchings for retaining the moisture in the soil during dry weather.

AUTUMN-SOWN ONIONS.—The crop of autumn-sown Onions will now be ready for harvesting. Allow the bulbs to remain exposed to the air as late in the season as possible, but as they need to be protected from rain, an open shed should be selected. If they are placed on hurdles or an open staging which allows the air to pass freely amongst them, Onions may be kept in a good condition late in the autumn.

LEEKs.—Further plantations of Leeks may be made now to furnish a supply of stems for use during the spring months. The land for this crop should be well manured, and the plants put out in rows formed at 18 inches apart. If drills are drawn a few inches deep, and the Leeks planted with an ordinary dibber, the soil may be worked into the drills as hoeing proceeds later in the season. Give liberal supplies of manure water to Leeks planted early in the season, and afterwards hoe the ground freely between the rows to keep the surface soil loose.

ENDIVE.—Endive sown a month ago is now ready for transplanting. A border facing east should be selected, allowing a distance of 15 inches apart either way between the plants, to permit of space for hoeing, which should be carried out frequently. Another sowing of Batavian Endive should be made now to furnish leaves for use during the winter months.

LETTUCE.—A sowing of Lettuce to furnish a supply of plants for early winter use should be made about the end of July. The seedlings should be transplanted, as soon as they are large enough, to some sheltered border, where protection may be afforded during November. Hardy White Cos, Brown Cos, All the Year Round, and Maximum are reliable varieties for this sowing. If the same varieties are sown a week later, and the seedlings planted, when large enough, in cold pits or frames, they will furnish a supply of Lettuce through the greater part of the winter. At Frogmore, we make several sowings of these varieties in July and August for use during September, and again in September to furnish plants early in the spring.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

STRAWBERRIES.—Fresh plantations of Strawberries may now be made with every prospect of success. Early-layered runners should, if possible, be planted, but they should be severed from the parent plant for a few days previously in order that they may not experience too great a check. Should dry weather, or other unfavourable conditions prevent planting, the layers should be stood in groups or placed in a cold frame until such time as the work can be carried out. It will be an easier matter to water and otherwise care for the plants under these conditions than when they are spread over a large area, besides decreasing the risk of losses caused by excessive heat or drought. Established beds of Strawberries from which the fruit has been gathered should be cleared of all weeds and runners, but do not remove any of the green foliage—except such as may have been damaged whilst the fruit was being gathered—however old it may be. Denuding the plants of foliage is the surest way to check the maturing of the crowns upon which the next season's crop depends. During dry weather the beds should be kept thoroughly moistened by frequent applications of water.

GENERAL REMARKS.—Stop, thin, and regulate the summer shoots of all wall trees. Apricots, Peaches, and Nectarines should be examined carefully, and all superfluous shoots removed. During hot, dry weather the roots should receive a thorough soaking of water, and, if not done already as advised in a former calendar, a suitable mulching should be applied, as heavy waterings must soon be withheld, especially if the soil is of a heavy, retentive nature. Continue the summer pruning of Apples, Pears, Plums and Cherries; the fore-right shoots which have been shortened already may soon be cut close to the spur, as there will now be little danger of the buds breaking into growth, and the pruning will allow more light and air to reach the remaining buds and spurs. Continue to give the trees an occasional syringing, for it is an important detail and must not be neglected as the trees must be maintained in a clean and healthy condition. The summer pruning of standard, espalier, pyramid, and bush trees must still be practised regularly, removing carefully all superfluous wood. With a light crop of fruit most kinds of trees are making a vigorous growth, hence it is more than ever desirable that all unnecessary shoots should be promptly removed, thereby admitting the necessary light and air to those that remain. Wherever the American blight is present, either on the stems or main branches of the trees, immediate steps should be taken to check or destroy the pest. An excellent and safe remedy to employ at this season is a mixture of soft soap and linseed oil, made into a thick paste and applied with a stiff brush. This pest is often overlooked, or its destruction neglected at this time of the year, but if a careful watch is kept now and remedial measures employed, the pest may be prevented from spreading. Outdoor Grapes should be finally thinned, if necessary, and the laterals of the vines shortened to one joint. The old canes of summer-fruited Raspberries that have ripened their crops may be removed entirely; if allowed to remain they will deprive the plant of considerable nourishment, besides preventing much light and air reaching the young shoots; unripened canes seldom fruit satisfactorily, and are more subject to damage by severe frosts.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

TROPICAL NYMPHÆAS.—We have now a beautiful display of *Nymphaea pulcherrima* growing in an outside tank, in which the water is always maintained, approximately, at a temperature of 70° Fahr. It is a small tank, but there are frequently 12 or more flowers expanded at the same time. I mention this to induce others to adopt our method of culture. In making a start, the first thing to do is to select a warm site, a position facing either to the south or west should be chosen. As the water must be warmed, the tank will need to be

furnished with pipes connected with the hot-water service, and this is most easily done by building it close to one of the glasshouses. We do not, even in winter, place a cover over the tank, as the water is warmed sufficiently by the pipes to ward off frost. Nine inch brickwork, cemented on both faces, and over the bottom, affording a depth of 2 feet at the most, is all that is needed. In another tank we have planted *Nymphaea stellata*, Berlin variety, and the growths are just coming up; this tank also is not covered, but we have others which are covered with a span-roofed frame, in which *N. stellata* Berlin variety and the Gunnersbury form of *N. gigantea* are cultivated. In these the plants are flowering freely, the flowers being of unusual vigour. Black Aphis is sometimes troublesome on the plants, and the pest needs to be destroyed at an early stage. So far this season we have scarcely seen the Black Fly, although last year it was very prevalent on the *Nymphaeas*.

STANDARD DECORATIVE PLANTS.—It is well to select a few promising young plants of such kinds as *Codiaeums* (Crotons) with single stems, and train them as standard plants, although not necessarily with bushy heads. In the case of such as *C. Warrenii* and *C. Johannis* all that is needed is a tall, single stem to allow the long, pendulous leaves to display themselves to advantage, but such sorts as *C. angustifolius* and *C. Chelsoni* do best when trained to three or four shoots. Varieties with broad, massive foliage, such as *C. Reidii* (the finest of all *Codiaeums* when well coloured), and *C. Baronne James de Rothschild* (the most enduring decorative variety known to me) also do well trained to single stems. See that such single-stemmed plants as *Thyracanthus rutilans* have care bestowed upon them. These will now thrive well in a light, airy house, such as the intermediate stove. Where the greenhouse proper is not now overcrowded or even filled at this season, it may be used as an intermediate house for the time being. In this way it is possible to secure a harder and more enduring growth in the plants that will stand them in good stead when the flowering period arrives. Standard stove plants are most useful in special decorative groupings later, and careful attention at this season of the year will be amply repaid by fine specimens.

APHELANDRA AURANTIACA ROEHLII.—If raised from seed, as previously advised, plants of this species should now be growing into nice specimens. It is surprising how well this plant will flourish in dwelling-rooms in the winter, forming an attractive object.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

MELONS.—Where the fruits on Melons growing in frames are showing signs of ripening, a free circulation of air should be permitted and the supply of water at the roots diminished gradually. The fruits need to be well exposed to the light, and syringing should be discontinued. It is an advantage to circulate a little warmth in the hot-water pipes at night time, as this will allow the ventilators to be opened a trifle, thus benefiting the plants, besides improving the flavour of the fruits. Melon plants intended for late cropping in houses will need to be kept growing sturdily. Should the house be not yet available, the plants should be re-potted into 6-inch pots, using a rich rooting-medium. Afford water at the roots carefully after the re-potting. Keep the foliage in a healthy condition, syringing as often as is beneficial. Expose the plants fully to the sunlight, excepting for 2 day or two after potting, at which period the plants should be shaded with a thin sheet of paper during the hottest part of the day.

PINEAPPLES.—Newly-potted suckers of Queen Pines will need very careful watering, as an excess of moisture may cause the soil to become sour. If the compost is in a proper condition at the time of potting, and the pots are plunged in a bed of leaves or tan having a bottom-heat of about 85° to 90°, the plants will not need much root-watering, provided the necessary attention is paid to damping down and syringing overhead. Pots of about 6 inches in diameter will be found a convenient size, and the compost may consist

almost wholly of loam, but it needs to be of fibrous character. The pots should be well drained, and the suckers potted firmly well down in the receptacles. The disuse of fire-heat entirely is not to be recommended, as it is necessary to have a free circulation of air at night-time.

STRAWBERRIES.—The perpetual-fruited Strawberries now being grown in 6-inch or 7-inch pots to provide a succession of berries in the autumn will need manurial assistance, and strict attention to watering. Keep the surface of the soil free from weeds, periodically remove the runners and flower spikes, and either syringe the plants each morning and night, or damp with a rose-can the layer of ashes on which they are stood to keep the surroundings moist and cool. The plants need a position that is partially shaded from sunshine. St. Joseph and St. Antoine de Padoue are two excellent varieties of perpetual-fruited Strawberries. The potting of newly-layered runners of the ordinary type intended for early forcing into their fruiting pots should be carried out as soon as possible, and the plants either stood on battens or sifted cinder-ashes to prevent worms from entering the pots. Continue to layer further runners if these are required.

CUCUMBERS.—The present is an ideal season for Cucumbers; because very little artificial heat is required. Plants in full bearing will need frequent attention in thinning, stopping and tying the shoots, and in removing all fruits of an unsatisfactory shape. The roots will need an abundance of moisture and rich surface-dressings frequently. If the plants are growing in houses, the paths should be damped down early each evening with strong manure water. Sow another batch of seeds in a gentle heat, placing them singly in small pots. These plants will furnish an autumn supply.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

THE SEASON.—In this district we are passing through a second period of drought accompanied with great heat. The effect can be seen in the autumnal flowers and shrubs commencing to bloom before their usual season. Dahlias, for instance, are now carrying more flowers (July 15) than was the case three weeks later last year, and some perennial plants that were raised in spring from seeds for the purpose of flowering late in autumn, appear likely to expend their energy long before that time. In all cases where it is possible the reserve plants should be prevented from blooming by pinching off the more forward buds. A greater number of reserve plants will be required this season than usual for the filling of blanks. *Aconitum Napellus* very soon loses its attractiveness after its flowers are past, and if the plants are in conspicuous positions the stems should be cut to a few inches from the ground and reserve plants of some other kind placed amongst them, such, for instance, as China Asters or early flowering Chrysanthemums like *Horace Martin*. Self sown plants of annual *Calceolarias* are also useful for making up blanks. They have a somewhat weedy appearance, but this is not noticeable when they are arranged with other plants.

HOLLYHOCKS.—The disease has already appeared upon these plants, and the worst leaves should be picked off and burnt before the fungus matures. So long as the stems are not seriously attacked the plants will not suffer greatly from the loss of the lower leaves, and it is not a difficult matter to hide the bare stems with other vegetation. The positions the plants occupy appear to have a considerable effect on their liability to disease, for instance, in some parts of the garden here Hollyhocks are almost free from the disease, whilst in others they are attacked badly every year.

POPPIES.—A collection of these fugacious flowers may very well be selected for the garden borders. At the present time a considerable number of Poppies are in flower, and they are all attractive. *Papaver alpinum* possesses an extensive range of flowers both in single and double varieties. The plants flower for months together provided the seed capsules are removed

as soon as the petals fall. A double variety of *P. somniferum*, known as cardinal, is perfectly brilliant, whilst the salmon-rose form of the same species is equally desirable on account of its soft colouring. There are three species, all with Orange-coloured flowers, which provide very uncommon shades. These are respectively *P. pilosum*, *P. rupifragum* and *P. aculeatum*. The exhausted stems of these should be cut down from time to time in order to allow new growths to appear and furnish a succession of flowers. All these Poppies can be raised with ease from seed. In addition there is the large flowered *P. bracteatum* and *P. orientale*, which after the first resplendent display in early summer produces a few blooms throughout the following months, provided always that the old stems and seed vessels are removed from time to time. These two plants are propagated by means of pieces of roots. The species of *Meconopsis* are less easy to grow than the true Poppies, unless it is that they prefer a damper and stronger soil. *M. Wallichiana* really does need this, and probably *M. integrifolia* also. Both species are increased from seeds. Some seeds of *M. integrifolia* sown last autumn grew at once, but some lay dormant until June, thus furnishing another instance of the desirability of keeping pans or pots that have been sown with seeds of perennial plants for a longer time than inexperienced cultivators might think desirable.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

THE SEASON.—The weather is still of a tropical character, and much extra time has to be spent in damping and watering. Cattleyas, *Laelias*, *Dendrobiums*, and all warm-growing, sun-loving Orchids are showing by their healthy-looking growths how much they enjoy the warm air and bright sunshine. But the great heat renders it very difficult to keep the cooler-growing species cool enough, ventilation only making matters worse by causing a dry atmosphere. Up to the present, the nights here have been somewhat cool and refreshing, however, and, with the ventilators left open, the plants get the full benefit of what little dew there is, and the cool night air in which to recuperate any loss sustained by reason of the excessive heat during the day. The maintenance of a suitable atmosphere in Orchid houses during this tropical weather is very important. No matter how well the plants are treated in other ways, they will not continue in a satisfactory condition unless a proper atmosphere is maintained. To say that a house must be damped at a given time, and ventilated at another, is a method of teaching that would never make anyone a good cultivator of plants. Personal experience in and about the houses, strict observation of the plants, and learning the lessons that only the plants themselves can teach are the surest helps to success. I will not venture to say that an atmosphere that is pleasant to the senses is always the best for the plants, but, at the same time, one can usually tell on entering the house whether it has that buoyant feeling that is necessary, or whether it is too hot and too moist, or, on the other hand, dry and draughty from too much air. The proper atmosphere is that in which the air is continually changing, the air currents being kept in accordance with the conditions out-of-doors; but a suitable temperature, according to the condition and state of growth of the plants; and duly charged with moisture. During bright, hot weather a very early start should be made in the morning, damping down the houses and syringing the plants, whilst the final damping for the day should be deferred for an hour or so later than usual. It is yet too soon to diminish the shading on any of the houses, but any plants needing more sunlight may be moved to a position where this can be admitted without injuring other plants. Should a change take place to cooler and damper weather a little more fire-heat would again be necessary, as it is very important to ventilate even the warmest houses at night as well as by day.

WATERING.—There is no more important operation connected with Orchid culture than watering, and even the most experienced grower needs to be very careful when carrying out this work. With a clear air and bright sunshine, care must be taken that the moisture applied to

the roots, as well as the atmosphere, is adequate for the needs of the plants. During the season of growth the terrestrial Orchids require proportionately more water at the roots than the epiphytal kinds. It is by attaining the habit of close observation that a correct knowledge can be acquired of what quantity of water is needed by any Orchid, and especially during its season of growth. Orchids may not appear to suffer from careless watering, differing in this respect from many other plants, but a time of reckoning will come, and this probably when it is too late to arrest the backward tendency. Plants that are now actively growing must not be allowed to suffer from want of moisture, either atmospherically or at the roots, yet if the latter are treated to excess they will be found in a decayed state at potting time, and the effects of this will be seen in the weak growths the following season.

THE FRENCH GARDEN

By PAUL AQUATIAS.

OLD MANURE BEDS.—The materials of the old manure beds are not greatly retentive of moisture, and unless a plentiful supply of water is available, good results cannot be obtained in a dry season. Celery, Carrots and Cauliflowers must be watered daily till the plants are well established and their roots have come into direct contact with the manure.

MELONS.—The hot weather has suited Melons splendidly. Ventilation is afforded the plants both day and night, and the glass may even be removed entirely from the earliest batch. The lights must, however, be stacked close at hand as it is necessary to replace them in dull and windy weather. Water is given regularly at least three times weekly, and always in the early mornings. The pruning will now consist of removing the unnecessary shoots and decayed leaves. A second batch of fruits may be obtained from healthy plants, and, with a little extra care, a good set may be obtained late in August or early in September. The fruits are examined two or three times daily with a view to cutting those which are ripe as they need to be disposed of quickly, being bad keepers. The fruits are stood in a cold place for a few hours before they are packed; they are then wrapped in paper and placed in flats or apple boxes, stalk upwards, some woodwool or short hay being placed between each fruit to prevent bruising.

CUCUMBERS.—Like Melons, Cucumbers have done well this season, and a good supply of fruits is still obtainable. The pruning is carried out carefully and regularly, every side shoot being cut back to the first leaf. This crop, in most cases, is more remunerative and reliable than the Melon crop, for there is nearly always a good demand for Cucumbers.

TOMATOS.—Tomatos planted in frames late in April are now ripening their fruits, and the leaves have been thinned to allow the sunshine to reach the fruits. The lights have been removed, and water is given freely. Tomatos growing in the open should now be stopped at one leaf beyond the last truss of fruits. There are as many as seven trusses on each plant. A deficiency of moisture in the soil at this stage will render the fruits liable to cracking.

CELERY.—The first batch of Celery may now be bleached by spreading mats over the plants for a period of eight or ten days, when they are large enough for marketing. The last batch of Celery is now being planted in its final quarters to furnish a supply of stems after Christmas.

STRAWBERRIES.—Two-year-old Strawberry plants intended for forcing, should now be potted in 6-in. pots employing the compost previously prepared for the purpose. They should be placed closely together in frames where they will be wintered. The roots must be kept moist to prevent an attack of mildew.

MANURE.—The stock of manure to be used next spring is now being collected as fast as it can be obtained. If it is stacked in a dry state and kept dry, little fermentation will take place, and the best qualities of the manure will be preserved intact.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 22—Paisley Florist Soc. Sh.

TUESDAY, JULY 25—
Nat. Carnation and Picotee Soc. Exh. at R.H.S. Hall.

WEDNESDAY, JULY 26—
Cardiff and County Hort. Soc. Sh. at Sophia Gardens (2 days). Bishop's Waltham Fl. Sh. Irish Gard. Assoc. meet. Chesterfield Fl. Sh. Leamington Fl. Sh. (2 days). Haywards Heath Fl. Sh.

THURSDAY, JULY 27—
St. Ives Fl. Sh. Yorkshire Agric. and Hort. Sh. at Rotherham (3 days).

FRIDAY, JULY 28—
Southampton Carnation and Sweet Pea Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.5°.

ACTUAL TEMPERATURES.—
LONDON.—Wednesday, July 19 (6 P.M.): Max. 76°; Min. 54°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 20 (10 A.M.): Bar. 30.3°; Temp. 76°; Weather—Sunshine.

PROVINCES.—Wednesday, July 19: Max 74° Cambridge; Min. 59° Ireland N.W.

SALES FOR THE ENSUING WEEK.

FRIDAY—
Choice Imported and Established Orchids in variety. Dwarf Japanese Trees, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Soils and Crops.*

The report on the *Agriculture and Soils of Kent, Surrey and Sussex* by Messrs. Hall and Russell is a remarkable book, and will, as we believe, mark an epoch in British agriculture. Though Mr. Hall, in his prefatory remarks, modestly disclaims for this work the title of a finished survey, and prefers to regard it as a sketch, yet, so great is the quantity of information that it contains and so serviceable is that information to the farmer living within the three counties, that the book well deserves the more ambitious title.

The point of view adopted in the report is briefly as follows:—A given area of agricultural land—that of the three counties already named—is marked out for investigation. The geological char-

acters of this area are known. If it is found that mechanical and other analyses of soils from a large number of typical fields over this area show common characteristics, and if it is found that these analyses distinguish the soils of one geological formation from those of any of the others, then it may prove possible to arrive at a rational explanation of the general geographical distribution of the various agricultural industries to which the several districts of that region are devoted.

The practical applications which may follow from such conclusions, which we may add the authors have demonstrated to be sound, are numerous. In the first place, they enable the authors to make recommendations as to the nature of the manures to be applied to the soils which overlie the several geological formations. Throughout such and such an area, overlying such and such a geological formation, a definite system of manuring may be prescribed with confidence; in another area the use of other manures may be recommended. Hence the farmer has only to determine the geological position of his land by reference to the large scale map of the Geological Survey and then to turn to the pages in the report which deal with the manuring of a crop commonly taken on the land of that region to ascertain whether his system of manuring conforms with that recommended by Messrs. Hall and Russell.

This is but one of the practical services which the survey serves. Again, a grower who contemplates taking up some special branch of agriculture, fruit growing for example, has, through the medium of this report, a summary of the experience of fruit growers in general throughout the region. He can turn to the map illustrating the present geographical distribution of this industry. He can trace thereon the relation which this distribution bears to soil, aspect and rainfall, and can then form a pretty sound judgment as to whether the land which he contemplates putting under fruit is physically adapted for that purpose.

In making the foregoing rapid survey of what we conceive to be the guiding idea of the work, we have, for reasons of brevity, omitted reference to many other factors which come in in determining the kind of farming which is practised in a given region. These factors have, of course, not been lost sight of by the authors, who discuss not only the geological formations met with in the area, but also the general physical characteristics of the region, which characteristics—altitude, aspect, water supply—are of no less importance to the farmer than the geological origin of his soil.

Perhaps the most fascinating, as well as the most generally instructive feature of the report is the series of maps depicting what we may call the density of distribution of the agricultural industries of the area and including arable land, grass land, cattle, dairy cows, sheep in summer, woodland, as well

as special crops, namely, fruit, Potatoes, Hops, Lucerne, Barley, Wheat, Mangolds and Turnips.

We can best illustrate the thorough-going way in which Messrs. Hall and Russell have performed their work and the usefulness of the results which the report presents by giving in brief outline their main conclusions with respect to one crop, for example, fruit.

Of the three counties, Kent stands prominently foremost as a fruit-producing region. Its Cherries have earned almost world-wide fame, and its Strawberries are nearly as well known. Yet a glance at the map shows that the fruit-growing industry is by no means generally distributed over the county. Comparison of this map of density of production with the geological map shows that the cultivation of fruit is only carried on to any large extent on certain soils. These soils run from S.E. of London on the Thanet sands and the chalk as far as the Medway Valley. West of Maidstone, the lower green sand on either side of the Medway Valley bears also numerous orchards which are driving out the Hops. Following that valley, fruit may be traced as a considerable crop, along the alluvial soils and even the sands and clays of the High Weald, but where the greensand stops there the large breadths of orchards stop likewise. Eastward of the Medway Valley is the rich area of fruit land—formed of the deep loams of the Thanet sand, chalk and brick earth—from Rochester to Canterbury. Beyond Canterbury it follows the outcrop of the Thanet sands. Broadly speaking, fruit and Hops run together, fruit preferring, however, the lighter soils. Strawberries, in particular, follow the lighter soils and occupy large regions of the Thanet sands of North Kent. In East Kent the Nuts, common in the west—especially on the tops of the hills where the ragstone (lower greensand) lies near the surface—are replaced almost entirely by Cherries, which thrive on a substratum of chalk.

The distribution of orchards having been traced, methods of cultivation are considered, the compositions of the characteristic fruit soils, brick earth and Thanet beds are given, and the manurial requirements of the soils are detailed.

As we have indicated, we regard this report of Messrs. Hall and Russell of the highest importance. It brings together for their common service the isolated experience of farmers and growers. It adds to that experience the requisite scientific knowledge gained from comparative analyses of soils to provide a test of its validity and to enable any individual to improve his practice if need be. In conclusion, it remains to be stated that the report is issued by the Board of Agriculture. We congratulate the Board on its public-spirited enterprise in persuading the Treasury to find the money, without which this copiously-illustrated volume could not have been produced except at a cost prohibitive to many of those—the practical growers—for whom it is intended.

* *Agriculture and Soils of Kent, Surrey, and Sussex*, by A. D. Hall, F.R.S., and Dr. E. J. Russell. (Board of Agriculture; London.) 2s. 6d.

MECONOPSIS DELAVAYI.—There is little doubt that the limit of the genus *Meconopsis* has not yet been reached by botanical explorers, and that, as exploration is carried further into the mountainous regions of N.-W. Yunnan and S.-E. Tibet, we may expect many new species to be discovered. Two new species have been found there during the past few years, *Meconopsis speciosa* Prain, and *Meconopsis Forrestii* Prain, both valuable plants, especially the former

species, for cultivation in the rock-garden. Seed has also been secured of a few of the best-known species. Concerning *Meconopsis Delavayi*, Franchet (see fig. 24), Mr. GEORGE FORREST writes as follows:—"This beautiful little plant was first discovered by Père DELAVAY, in 1884, on the eastern flank of the Lichiang Range, N.-W. Yunnan, at about 12,500 feet altitude. In height, it varies from 5 to 9 inches, reaching the latter only in the most favourable situations. The

roots are long, thick, and fleshy. Leaves all radical, glaucous; petioles long, 8 to 10 cent., limb lanceolate, 2 to 3 cent. long by $1\frac{1}{2}$ to 2 cent. broad; obtuse, either attenuated towards the base or cordate, glabrous on upper surface, with the under surface bearing a few ruddy hairs. Peduncles stout, sparingly hirsute towards the apex; flowers solitary, semi-pendulous, $1\frac{1}{2}$ to 2 inches in diameter, colour deep, satiny, purple-blue. Sepals glabrous; petals four, occasionally five,

[Photograph by George Forrest.]

FIG. 24.—*MECONOPSIS DELAVAYI* GROWING WILD IN CHINA: FLOWERS PURPLISH-BLUE.

ovate, obovate, or oblong; filaments filiform, of the same shade as the petals; anthers deep orange. Mature capsule, erect, 2 to 3 inches in length by $\frac{1}{4}$ inch diameter. This charming species flowers in June and July, and there is little doubt of its proving perfectly hardy in this climate. The flowers, with their shining, deep-coloured petals and orange-coloured anthers, form a delightful contrast to the glaucous green of the foliage and scapes. The species is gregarious, and delights in open, sheltered situations. The first specimens found by me formed small, scattered colonies along the base of a series of ragged limestone cliffs, at about 11,000 to 12,000 feet. These were growing on poor, patchy pasture, in the shelter of dwarf bushes, and under the lee of rocks; the soil was composed of limestone, gravel, and chips of varying size. The roots of the species are thick and fleshy, and, in this exceedingly free formation, penetrated to quite a considerable depth, in many instances as much as 12 to 18 inches. Later in the season, the species was met with in greater abundance at a higher altitude (13,000 to 14,000 feet), growing amongst heavy, Alpine pasture, in conjunction with *Meconopsis integrifolia* and *M. Forrestii*. One peculiar feature of *Meconopsis Delavayi* is the remarkable elongation of the scape during the maturation of the capsule; some seen were as high as 2 feet, or nearly four times the normal height of the scape during the flowering period."

NATIONAL CARNATION AND PICOTÉE SOCIETY.

—The annual exhibition of the National Carnation and Picotee Society will be held in the Royal Horticultural Society's Hall, Vincent Square, Westminster, on Tuesday, July 25. Particulars may be obtained from Mr. T. E. HENWOOD, the hon. secretary and treasurer, 16, Hamilton Road, Reading.

ROYAL GARDENERS' ORPHAN FUND.—The secretary of this fund, Mr. BRIAN WYNNE, informs us that on and after Monday, July 24, the office will be at 19, Bedford Chambers, Covent Garden, London, W.C., instead of Milton House, Surrey Street, Strand.

BRITISH PTERIDOLOGICAL SOCIETY.—The annual meeting of this society will be held this year at Barnstaple, on Monday, August 7. Members will proceed to Barnstaple on the previous Friday, meeting in the evening at the "Golden Lion" Hotel, which will form the headquarters of the society. Arrangements will then be made for the Fern-hunting excursions. The Hon. Secretary is Mr. CHAS. T. DRUERY, 11, Shaa Road, Acton, London, W.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—This association held its annual exhibition on the 15th inst. in the Alexandra Palace, occupying the conservatory and the hall adjoining. The president's gold medal was won by Mr. J. G. HARDY, of Upper Clapton, for a group of cut blooms from zonal *Pelargoniums*.

A BATTLE OF FLOWERS.—A Battle of Flowers was held on the 15th inst. on the spacious Pageant Ground of the Festival of Empire at the Crystal Palace. The battle was opened by Lady JANE KENNY-HERBERT, and MURIEL Lady HELMSLEY presented to the winners hand-painted banners bearing designs taken from the Pageant episodes and worked by the pupils of the Royal School of Art Needlework. The first prize was shared by a Queen Elizabeth litter of pure white, with green festoons, for which inhabitants of Westminster were responsible, and an ox-wagon organised by residents of Sydenham, the third prize being awarded to a Canadian car from Putney.

THE BOARD OF AGRICULTURE AND FISHERIES desire to draw attention to the reduction in price of the sectional volumes of leaflets useful to gardeners, farmers, teachers, &c. The reduced price of a full set of the 12 volumes is 9d., post free. Large quantities of any particular volumes, for distribution to allotment holders or schools, may also be obtained at the reduced rate of 9d. per dozen copies, carriage paid. Remittances should be in the form of cheques, money or postal orders made payable to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., and crossed "Bank of England." Letters so addressed need not be stamped.

THE CO-OPERATIVE FESTIVAL.—The Co-operative Festival, which has always been held at the Crystal Palace, will this year take place at the Hampstead Garden Suburb on Saturday, August 26. It is organised by Co-partnership Tenants (Limited), in conjunction with the National Co-operative Festival Society. A flower show will also be held, for which prizes are offered. A feature of the festival will be the competitions of co-operative choirs from all parts of the country for the Earl GREY and other shields.

HORTICULTURAL COLLEGE, STUDLEY CASTLE.

—The Countess of WARWICK has issued invitations to the British Medical Association to an "At Home" at the Horticultural College, Studley Castle, on the 27th inst. The students will give a pastoral play on the occasion, and the departments of the college will be open for inspection.

NEW PARK AT HULL.—A new public park at Hull, the gift of Mr. CHRISTOPHER PICKERING, J.P., was opened by Mrs. PICKERING on the 15th inst. The site occupies some 50 acres, and is situated in a part of the city occupied largely by those engaged in the fishing industry.

NORTHERN FRUIT CONGRESS AND SHOW.

A fruit conference, similar to the Congress which proved so successful last year at Hexham, has been arranged for November 15 and 16, and will be held in the Town Hall and Corn Exchange, Newcastle-on-Tyne, in conjunction with the show of the Newcastle Chrysanthemum Society. The proceedings will be held under the auspices of the North of England Horticultural Society, the Four Northern Counties' Scientific Committee in Horticulture, the Hexham Committee of the Northern Fruit Congress and Show, and the Newcastle Chrysanthemum Society. Medals are offered by the North of England Horticultural Society, which will also grant certificates to new plants, flowers, and vegetables. Cups, medals, and money prizes will also be awarded (as distinct from the Newcastle Chrysanthemum Society's scheduled cups and prizes). The proposed syllabus is as follows:—Wednesday, November 15: Afternoon: "Fruit Culture in the North," by Messrs. J. S. CHISHOLM, Horticultural Instructor for Northumberland; and W. B. LITTLE, Lecturer at Armstrong College and Horticultural Instructor for Cumberland and Westmorland. Evening: "Horticultural Education." Thursday, November 16: Afternoon: Lectures on fruit bottling and pruning, with demonstrations; lecture on "Soils and Food Supplies." Evening: Lecture on "Diseases of Fruit Trees." All correspondence relating to the congress programme should be addressed to R. A. H. GRAY, Esq., M.A., M.Sc., Secretary Four Northern Counties' Scientific Committee in Horticulture, Armstrong College, Newcastle-on-Tyne. Exhibits of horticultural sundries,

and all matters relating to the scheduled exhibits of the Newcastle Chrysanthemum Society are under the supervision of Mr. W. MARRISON, Secretary, Newcastle Chrysanthemum Society, 7, Hutt Street, Gateshead, to whom all correspondence on such subjects must be addressed. A sum of £50 is needed to publish the verbatim official report of the Hexham Fruit Congress, 1910. Correspondence relating to this matter should be addressed to the Rev J. BERNARD HALL, Rawdon, Leeds. It is hoped to continue the Northern Fruit Congress, in September, 1912, at Carlisle, and then return to Hexham, in 1913.

REMEDIES FOR APPLE SUCKER.—It is stated in a recent issue of the *Journal of the Board of Agriculture* that, in addition to the methods recommended in Leaflet 16 to be employed against Apple Sucker (*Psylla mali*), one of the Board's inspectors has found two remedies very useful during the last few years. These are respectively a nicotine wash of strength about 0.075 per cent., and a lime and salt wash containing 20 per cent. of lime and 2 per cent. of salt. The nicotine wash has proved superior to paraffin emulsion, and is absolutely innocuous to leaves and flowers. It should be used after the young begin to hatch out. A solution of this strength was found very successful at Woburn in 1908, 99 per cent. of the *Psylla* being killed in the case of 10 dwarf Apple trees sprayed on May 17, when the blossom buds were just open. The wash does not appear to be injurious to bees. The lime and salt wash should be applied in the middle of March or even later. Theobald recommends its application between the time of the opening of the buds and about two weeks beforehand. The action of the wash is described as forming a coating over the egg, and so preventing the breaking of the shell and the escape of the young insect. Trees that have not borne fruit for several years have yielded after the use of this wash.

STRAWBERRIES ON LIGHT SOILS.—A note with the above title, published in the *Journal* of the Royal Horticultural Society (May, 1911), records the results of planting over 40 varieties of Strawberries six or seven years ago. It was found that after three years many of the best varieties had failed. In spite of special care in cultivation—layering in pots in good soil and potting out the rooted plants in well-manured and prepared beds—only some half-dozen varieties continue at Wisley to fruit for two years and to make really good rows in the sandy soil there. Mulching in spring and digging in the mulch at once is found to be good practice. The varieties which have proved themselves best at Wisley are:—Aprikose, Climax, Cropper, Fill-basket, Royal Sovereign and Scarlet Queen. The two last-named serve for dessert fruit and force well, and for cooking and preserving purposes Climax, Cropper, and Fill-basket suffice.

PLANT INSPECTION IN FRANCE (see p. 47).—The Minister of Agriculture of France has instituted a sub-department for the inspection of nursery and other horticultural stock and for the issuing of certificates that such stock is free from insect and fungus pests. The details of the scheme are published in *Le Jardin* (June 20, 1911). A feature of interest in connection with this new departure is that all growers who wish to take advantage of the service of inspection will pay a tax of 25 francs (£1) and that any surplus left after expenses have been met will be returned to the contributing nurserymen. A weak point in the scheme, though it is difficult to see how it is to be remedied, consists in the refusal of the State to incur any liability in the event of the certificates which it issues being refused recognition by the authorities of foreign States.

A GERMAN HORTICULTURAL COLLEGE.—The German Horticultural College of Kostritz, Thuringen, was founded in 1887, and is about to remove into new and enlarged quarters. Upwards of 2,000 gardeners have passed through this institution since its foundation, and its increasing usefulness seems indicated by the fact that the number of students in attendance (191) during the last half-year was greater than in any previous corresponding period.

INTERNATIONAL CONFERENCE OF GENETICS.—The organising committee of the fourth International Conference of Genetics met at Paris on June 14, under the presidency of Dr. VIGER. Mons. PHILIPPE DE VILMORIN, the secretary of the committee, informed the members of the arrangements up to the time of the meeting. He stated that he had received the names of 130 supporters, including three honorary members. The sum received in subscriptions amounted to 2,300 francs. In addition to French biologists, who are members of the committee, many scientists have subscribed, including Messrs. BAUR, GIESENHAGEN, GOLDSCHMIDT, FEITZER and POLL (Germany); AGAR, BATESON, DARBISHIRE, GREGORY, HARTOG, LAXTON, LYNCH, NETTLESHIP, PATON, PUNNETT, STAPLES-BROWNE, SUTTON, and Misses SAUNDERS, WHELDAL and DURHAM (Great Britain); BRADLEY (Australia); FRUWIRTH, STRAKOSH and TCHERMAK (Austria); W. ET C. SAUNDERS (Canada); JOHANSEN (Denmark); BALLS (Egypt); DAVENPORT, HAYS, HOWARD, SWINGLE and TOWER (United States of America); HAGEDOORN, HOUWINK, LOTSY and NORDUIJN (Holland); LEAKE (India); STRAMPELI (Italy); NILSSON-EHLE (Sweden); CHODAT (Switzerland); BORIS DE FEDTSCHEN-KO (Russia); and ARECHAVALETA (Uruguay). A large number of universities and scientific institutions will be officially represented. Numerous communications have been promised. Short references to these communications will be printed before the meeting of the conference, and they will be published in *extenso* in the *Proceedings*, a copy of which will be sent to each subscriber. The programme of the conference will depend on the number of the communications, but it seems probable that five sittings will be sufficient. The remaining time will be occupied by visits to the Museum of Natural History, to the Pasteur Institute at Garches, to Verrieres, to the Laboratories of the Sorbonne, &c. There will probably be a reception by the French National Society of Horticulture on September 18 and one at the Hotel de Ville on September 23.

THE EXPORTATION OF AUSTRALIAN APPLES.—That the export trade in Apples from Australia (including Tasmania) increases year by year is shown by the following statistics:—

Cases exported in				
Port.	1909.	1910.	1911.	
Melbourne ...	120,000	168,000	149,000	
Hobart , ...	172,000	228,000	295,000	
Adelaide ...	49,000	56,000	31,000	
Sydney ...	—	1,000	1,700	
Fremantle ...	—	—	4,000	
Totals ...	341,000	453,000	480,700	

A single boat shipped recently no fewer than 112,000 cases, and it was estimated that in a single week as many as 246,000 cases were put on board at Hobart.

PUBLICATIONS RECEIVED.—*Ways and Means in Photography.* (London: Burroughs, Wellcome & Co.)—*Weather Wisdom in Agriculture,* by W. R. Dunlop. (London: Vinton & Co., Ltd.) Price 1s. net.

SCOTLAND.

THE ROYAL VISIT TO EDINBURGH.

In connection with the recent visit of the King and Queen to Edinburgh, Mr. J. W. M'Hattie, the superintendent of the Edinburgh Parks and Gardens, was called upon to provide a large number of plants for street decorations, and most of these were obtained from the houses in Inverleith Park. In regard to the Princes Street Gardens, every care was taken to have the flower beds in the very best condition possible. Great credit is due to Mr. M'Hattie and his staff for the manner in which the work was carried out.

THE KING AND THE SCOTTISH HORTICULTURAL ASSOCIATION.

A DUTIFUL address was drawn up by the Scottish Horticultural Association to be presented to his Majesty the King. The society expressed the hope that King George might receive a favourable impression of Scottish horticulture. The address was signed on behalf of the association by Mr. W. H. Massie, president, and Mr. A. D. Richardson, secretary.

MR. ROBERT SCOTT.

MR. ROBERT SCOTT, gardener at Harvieston, Gorebridge, N.B., is leaving to take up an important appointment in Massachusetts, U.S.A. Mr. Scott is a son of Mr. William Scott, gardener at Drumpark, Dumfries, for a long period, and a successful exhibitor at leading Scottish shows.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PROPOSED REVIVAL OF THE ROYAL HORTICULTURAL SOCIETY'S "TRANSACTIONS."—At the last annual meeting of the Royal Horticultural Society in February I raised the question of the Publications. If I can judge from the manner in which my suggestion was received by the Fellows present, and from the letters I have since received from others who were not present, I have little doubt that an improvement both of the manner and the matter of publication is desired by the majority of those Fellows who wish to raise the general standard of knowledge in horticulture. I proposed a revival of the quarto *Transactions*, illustrated in colour when necessary, for the publication of papers of permanent value and interest, leaving the business matter, proceedings of Committees, and short notes and abstract to the *Journal*; and I suggested that if only such a small proportion as 10 or even 5 per cent. of the Fellows were willing to pay extra for such a publication (not to exceed £1 ls. per annum), it would not cost much, if anything, whilst it would vastly improve the status and influence of the Society. It seems to me that there is room for such an annual volume, which might serve to illustrate properly the very numerous and beautiful new plants which at present are more or less known from the horticultural Press, the *Botanical Magazine*, or trade catalogues, and would attract valuable contributions from members of the Society and others, who at present have no suitable means for recording and illustrating their work; lastly, that the first volume of these *Transactions* might come out most appropriately in the year of the International Exhibition, and would serve as a permanent record of many of the new plants and shrubs which will be shown on that occasion. I have just received (June 19) a circular dated May, and sent out with Part 3 of the *Journal*, also dated May, in which I am asked to subscribe one guinea a year "if and when the suggested publication by the society of *Scientific Transactions* is realised;" but, as there is nothing in this circular to explain the object of the publication or to inform Fellows of its probable value or style of

illustration, it seems to me that they cannot answer the question without further information and discussion. H. J. Elwes, *Colesborne*.

WASPS.—There appears to be an unusual number of wasps in this district, and we have already destroyed 20 nests in these gardens this season. Many queens were killed in the spring, whilst a gardener friend killed 150 queens during a period extending from January to the end of May. This appears rather remarkable, as so few nests were detected last autumn; we found only six nests, but the previous season we destroyed 40. How can the presence of so many queen wasps this season be explained? F. B., *Sparkeswood Gardens, Rolvenden, Kent*.

A FINE CHERRY TREE.—Though by no means a Cherry district, there is a remarkably fine specimen of a Cherry tree a short distance from here growing in the ornamental grounds of C. Cope, Esq., Darnhills, Radlett. I saw this tree just as it was coming into flower, and it was truly a remarkable sight. The height is 76 feet, circumference of the branches 231 feet, and girth at 3 feet from the ground, 13 feet 2 inches: a wonderfully well-grown tree, symmetrical and healthy. I believe the variety to be "Corone" or Hertfordshire Black, and I was informed that no fewer than 40 bushels of fruit have been picked from the tree at one time. E. Beckett, *Elstree*.

AMERICAN GOOSEBERRY-MILDEW.—After a long interval, on the 13th inst. I came across a bad outbreak of American Gooseberry-mildew. This will necessitate a systematic examination of gardens and nurseries in the district. The pulling of green Gooseberries is over for the season, but we have a lot of "pipes," and mildew would settle on them if left. Stephen Castle, *Walpole St. Andrew's, Wisbech*.

BUDDLEIA VARIABILIS AS A STANDARD.—In the winter or early spring of 1909 I set two small plants of this handsome shrub in my garden. One of them died; whether from frost or from exposure when transplanted is uncertain. The other lost the ends of the shoots, but it grew vigorously in the spring, perhaps 7 or 8 feet high, and it flowered profusely. I pruned it hard in the autumn, and again in 1910 it flowered very freely, some of the inflorescences being quite 18 inches long. The plant then consisted of a main stem and two or three smaller ones springing from near its base. Last autumn I cut away the secondary stems, and the branches of the main stem to a height of about 4 feet, leaving the head of numerous branches untouched. Now the main stem is between 7 and 8 inches in girth at a foot from the ground, and the whole plant about 13 feet high, in the form of a small tree. Until about a fortnight or three weeks ago, I thought it was not going to flower this season, as all the shoots had the appearance of having finished their growth without any trace of inflorescence. The lower leaves were changing to yellow, and some falling off, so about 10 days ago I gave the plant a copious watering and now every branch bears a terminal panicle of half-developed flowers. From an early stage the shoots are strongly heliotropic, from east to west following the sun. W. Botting Hemsley, *Strawberry Hill. July 15*.

TROPEOLUM SPECIOSUM.—In the gardens at Basing Park, Hampshire, this plant thrives most luxuriantly. It is planted on a north aspect against Rhododendrons and other evergreens, rambles over these shrubs and presents a picture when in flower throughout the summer months, equalled by few other creepers. It was planted by the present gardener, Mr. T. Down, 10 years ago. I have grown the species in these gardens the last few years with fair success. W. H. Y., *Rotherfield Park Gardens, Alton, Hants*.

—No one has yet mentioned two very important points in the successful cultivation of this plant. The shoots should all be pinched off as soon as they appear above ground except the one which is to climb. This shoot should again be pinched off when 6 feet from the ground, and the resultant shoots when they are a little higher. In this way alone can that dense column of shoots, and later on of blossom, be obtained.

The plant itself is quite easy to grow if planted 1 foot deep, and with another good foot of light loam and leaf-mould to root into. The best situation is a wall having a south or west aspect, where the passing shade of trees can be had, and to judge by the behaviour of the plants here this season they do not mind drought. *Basil Levett, Wychnor Park, Burton-on-Trent.*

—That *Tropæolum speciosum* may be successfully grown in various conditions, would seem to be evident from the correspondence on the subject in these pages. The two most luxuriant growths that I have seen in this county confirm this opinion. Thus at Killerton, the seat of Sir C. T. D. Acland, Bart., which is situated on the north side of Exeter, about midway between that city and Tiverton, I saw, a few years

below it to a width of a mile. The nursery faces east but is on rising ground; in the lower part, however, amidst bog and moisture-loving plants, the *Tropæolum* is allowed to grow as it pleases with the most satisfactory results. Both these conditions may be covered by Mr. A. C. Bartlett's statement, that the climate of Devonshire is not "hot in the general acceptance of the term," but that the excess of atmospheric moisture when the temperature rises above normal produces a close, muggy atmosphere, which induces the luxuriant vegetation for which both Devon and Cornwall are noted. *John R. Jackson, Claremont, Lympstone, E. Devon.*

—Four years ago last spring I was tempted to try some plants of this species to train up young Larch trees, which are grown partly for shade and partly for supporting

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 18.—The meeting held on this date was only very moderately attended, although the exhibition was a good one. The weather was hot, and many of the flowers, and especially Roses, had a withered appearance in the afternoon. Orchids were not so numerous as usual. The ORCHID COMMITTEE recommended a First-class Certificate to *Dendrobium Victoria Regina*.

The principal exhibits before the FLORAL COMMITTEE were Roses, Carnations, Caladiums, Pelargoniums, Gloxinias, Phloxes, Ferns and hardy flowers. This Committee recommended 11 Awards of Merit.

Some splendid Pineapples were shown by Lord

FIG. 25.—MESSRS. DOBBIE AND CO.'S EXHIBIT OF SWEET PEAS AT THE OLYMPIA SHOW.

(See p. 15)

since, a remarkably fine growth of the plant which had made itself a home trailing over bushes—if I remember rightly—of lavender, which were planted at regular intervals in a long narrow bed stretching in a westerly direction, but facing south, and thus exposed to full sunlight. The plant mingled with the bushes, and hung in festoons between them, producing a very brilliant effect. Under very different conditions, but equally luxurious in its habit of growth, the plant flourishes in the Exminster nursery grounds of Messrs. R. Veitch & Son, which are situated on the south-east side of Exeter, about 10 miles distant from the city and almost contiguous to the marshes bordering the canal and the River Exe, which opens out a little

climbers, such as Roses, Clematises, Actinidias, &c. I dug a good hole and added a little fresh soil, then took up a good spadeful of roots from the base of another plant, and planted the roots about 18 inches deep. In due course the young growths appeared, and were trained to string the first year. The second year they reached 12 feet and were a fine show; this season they look like growing 25-30 feet, and are now a blaze of colour. *T. speciosum* likes plenty of water and partial shade, and is extremely beautiful when allowed to ramble over branches. I would suggest that if deep planting were generally practised we should not hear of so many failures. *W. A. Cook, Leonardslee Gardens, Sussex.*

LLANGATTOCK in the fruit and vegetable section, and another noteworthy exhibit of fruit was a collection of Gooseberries staged by Messrs. JAS. VEITCH & SONS. The FRUIT AND VEGETABLE COMMITTEE granted seven Awards of Merit to varieties of Peas after trial at Wisley, and a similar Award was made to a new Bramble-fruit named King's Acre Berry.

At the 3 o'clock meeting in the lecture room an address on Irises was delivered by Mr. W. Rickatson Dykes, M.A.

Floral Committee.

Present: Messrs. W. Marshall and H. B. May (Chairmen); and Messrs. C. T. Drury, E. A. Bowles, T. W. Turner, Jno. Green, W. J. Bean,

G. Reuthe, J. F. McLeod, J. T. Bennett-Poë, R. C. Reginald Nevill, Charles Dixon, Herbert J. Cutbush, Arthur Turner, H. J. Jones, Chas. E. Shea, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, W. J. James, George Paul, W. B. Cranfield, W. Cuthbertson, R. Hooper Pearson, Jas. Douglas, John Jennings, A. Kingsmill, and C. Blick.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Edwin Beckett), filled a large table with plants of scented-leaved *Pelargoniums*, the exhibit being remarkable not only for the comprehensive collection, but also for the fine quality of the plants. The species were very remarkable. *P. tetragonum* has growths like a *Rhipsalis*; *P. betulinum*, the Beech-leaved *Pelargonium*, is well named. Two good scarlet-flowered varieties were observed in Moore's Victor and Ardens Major. *P. tomentosum* possesses a scent resembling Peppermint. Others of special merit were Pretty Polly, Blandfordianum, Radula and Artemesiodes. (Silver-gilt Flora Medal.)

Mr. L. R. RUSSELL, Richmond, contributed a

showed their choice strain of *Gloxinias* in batches of colours, set off by a row of standard *Plumbago capensis* and clumps of finely-flowered *Exacum macranthum*, *Hibiscus subviolaceus*, *Solanum Wendlandii* and *Cannas*, the group making a pretty colour scheme. This firm also showed Carnations and Roses. (Silver-gilt Banksian Medal.)

Mr. W. DEAL, Kelvedon, Essex, exhibited new varieties of Sweet Peas of his raising. The more notable were Juliet (soft blush pink, with extra-large standard), Kathleen (deep glowing cerise), Scarlet Monarch (red), and Bouquet (a small but pretty flower, veined with red on a buff ground, the wings being rose-tinted).

Mr. A. F. DUTTON, Iver, Buckinghamshire, showed 95 varieties of border Carnations. The most striking were the purple varieties, Iver Purple being of the shade known as royal purple. Bendigo is also of this shade. Several new sorts were included in the collection, of which Grahame White (white), Lord Kitchener (buff-coloured fancy), and Maud Allan (yellow-ground picotee)

and the bright-yellow *Cecilia* was also conspicuous. The variety Mrs. Fortescue is a bright shade of cerise; the mauve-coloured tree *Carnation Edna* is delightfully scented. (Silver Flora Medal.)

Messrs. PHILLIPS & TAYLOR, Bracknell, Berkshire, showed border Carnations, with vases of *Gypsophila* and *Coreopsis verticillata* for relief. The best of the Carnations were Miss Willmott (rose-pink), Daffodil (yellow), Hildegard (white), and Ellen Gottwartz (buff).

The Misses LE LACHEUR & SHERRIS, Henfield, Sussex, showed a collection of Carnations.

Mr. W. A. WATTS, St. Asaph, North Wales, showed a new pink border *Carnation* named W. A. Watts.

Amongst several fine seedling Carnations shown by Mr. CHARLES BLICK, Hayes, Kent, was a magnificent yellow-ground fancy named Leslie. The flower was of splendid form, the petals having rosy-crimson flakings on a buff ground.

Messrs. FRANK CANT & Co., Colchester, showed bunches of garden Roses. A selection of their

FIG. 26.—MESSRS. J. CARTER AND CO.'S EXHIBIT AT THE OLYMPIA SHOW.

(See p. 15.)

large bank of showy *Caladiums*, the group presenting a fine display of leaf-colouring. The paler varieties, such as Queen Alexandra (pale green and silver, with faint rose in the centre), Candidum (white, with tracery of green), Rose Laing (silver and rose), and Thomas Tomlinson (a broad border of green, the centre splashed with rose), were remarkably pretty. Amongst the larger plants were handsome specimens of John R. Box and Marquis of Campden. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed a batch of *Acalypha hispida* and varieties of Ferns. *Adiantum*s were well represented, such handsome sorts as *A. cardiolobum*, *A. Farleyense gloriosum*, *A. Veitchii*, with rose-tinted fronds, and *A. velutinum* being represented by well-grown specimens. A curious Fern is *Pellaea ternifolia*, the fronds having a dark bluish rachis, with pinnæ at intervals suggesting a *Galium*. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea,

were the more meritorious. Roy Morris (dark red), Daffodil (yellow), and Hayes' Scarlet were especially good amongst older sorts. (Silver-gilt Banksian Medal.)

Mr. JAMES DOUGLAS, Edenside Nursery, Great Bookham, Surrey, displayed choice border Carnations, the flowers being of splendid quality. The new yellow self Mrs. Elliot Douglas received an Award of Merit. Mrs. Andrew Brotherstone is a fancy *Carnation* of distinctive colouring; what appears to be a grey ground is heavily splashed with crimson; an added charm is its strong clove scent. Other good varieties were Elizabeth Shiffner (maize-coloured self), Mrs. Griffith Jones (rosy-buff), and Agnes Sorrel (clove). (Silver Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, showed Carnations of all types, including some excellent blooms of the *Souvenir de la Malmaison* Princess of Wales. Sir Chas. Freemantle, another of this section, was also well shown. White Perfection was good amongst the perpetual-blooming sorts,

choicer varieties are W. R. Smith (a pretty Tea Rose, cream, tipped with rosy pink), Duchess of Wellington (a deep yellow H.T.), Hugh Dickson (one of the best dark-coloured varieties and delightfully scented), Lyon Rose (good generally this season), Lady Hillingdon, and A. R. Goodwin H.T. (the petals flushed with coppery red). (Silver Banksian Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, had some of the freshest Roses in the show in a mixed group of flowers and plants. The varieties Harry Kirk, Dean Hole, White Killarney, Duchess of Wellington, Lyon Rose, and Mollie Sharman Crawford were most excellent. Besides the Roses were some choice Carnations and well-bloomed *Celosias*. (Silver Banksian Medal.)

Messrs. PAUL & SON, Cheshunt, exhibited a group of Roses on the floor. At the back were Ramblers, including Lady Gay and Hiawatha, with masses of bloom. Those of the larger-flowered type included fine flowers of Frau Karl

Deuschki, Maman Cochet, Constance Soupert, Reine W. Urban (cream, with a rose-coloured centre), Gustave Regis (a climbing H.T. variety), Nova Zembla (one of the best Rugosa varieties), and George W. Waud. (Bronze Flora Medal.)

Messrs. W. PAUL & SON, Waltham Cross, showed a few boxes of Roses, the flowers being large exhibition blooms of Nerissa H.T., Alice Cory Wright, Frances Charteris Seton, and Bianca.

Mr. PHILIP LE CORNU, Jersey, showed a new Hybrid Tea Rose named Duchess of Normandy, described by the raiser as a salmony-golden Dean Hole.

Roses were also shown by Messrs. BEN R. CANT & Co., Colchester, the blooms being arranged in large bunches. (Silver Flora Medal.)

Messrs. GUNN & SONS, Olton, Birmingham, arranged a large group of Phloxes on the floor.

ham. The flowers were grouped very effectively in a corner, and included General van Hentz (salmon-scarlet, with a white "eye"), Selina (mauve, crimson in the centre), G. A. Strohlein (of an intense shade of salmon), Météore (pink), Antonin Mercie (mauve, shaded white), and Dr. Charcot (Periwinkle-blue). (Silver Banksian Medal.)

Mr. F. LILLEY, Guernsey, showed Gladioli, principally varieties of the nanus or early-flowering section. The exhibit was arranged in a delightful manner, and was one of the prettiest groups in the Hall. We were especially pleased with the following varieties:—Sarnian Gem (salmon-pink, the lower segments blotched with red and carmine), Ardens (orange-red, with similar blotches as in Sarnian Gem), General Scot, Pink Perfection, and Crimson Queen. (Silver Banksian Medal.)

A large Fernery, with a water garden in the centre, planted with showy border flowers, was arranged by Mr. AMOS PERRY, Enfield. (Silver Flora Medal.)

Mr. R. UPTON, Guildford Hardy Plant Nursery, showed hardy flowers. Novelties included Françoia sonchifolia, Nierembergia rivularis (with white, Campanula-like flowers), Delphinium Zalil (with sulphur-yellow blossoms), and Lavendula spicata alba (white Lavender).

Messrs. DOBBIE & Co., Edinburgh, showed their fine, large-flowered African Marigolds Lemon Queen and Prince of Orange, of the colours indicated by the names. They had also a vase of their new salmon-coloured Sweet Pea named Melba, a bold, massive flower, of a rather lighter shade than the well-known Earl Spencer.

Messrs. WHITELEGG & PAGE, Chislehurst, Kent,

FIG. 27.—FLOWERING SHOOT OF *PLAGIANTHUS LYALLII*.
(Received R.H.S. Award of Merit on Tuesday last.)

The finer sorts were Miss Willmott (lavender), King Edward VII. (reddish-scarlet), Elizabeth Campbell (old rose, white in the centre), Violet, Baron van Dedem (orange-scarlet), and Le Madhi (violet-blue). (Silver Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, exhibited varieties of Phlox decussata, including several fine sorts of Continental origin. A few of the choicer varieties are Elizabeth Campbell (old rose, passing to white in the centre), Iris (a fine purple variety), Flora Hornung (pink and white, with a purple "eye"), Météore (pink), General van Hentz (salmon scarlet), and Frau Antonin Buchner (white). (Silver Flora Medal.)

Another exhibit of Phloxes was made by Messrs. H. J. JONES, LTD., Hither Green, Lewis-

Messrs. KELWAY & SON, Langport, Somersetshire, exhibited large numbers of Gladioli, Gaillardias, and Delphiniums. The last two were arranged together, the Gaillardias being splendid flowers. The blue Delphiniums had faded considerably in the intense sunshine, the best being Macaulay, Excelsior, May Morison, Brilliance, and Knight of the Grand Cross. A selection of the Gladioli includes Queen Maud, Mrs. Coddington and Countess of Leicester.

Mr. MAURICE PRICHARD, Christchurch, Hampshire, showed hardy flowers of splendid quality, making a bold mass of blooms. Coriaria japonica, Asclepias tuberosa, Crinum Powellii, and a selection of border Phloxes comprised some of the choicer kinds. (Silver Banksian Medal.)

showed a mixed group of Scabiosa caucasica perfecta and Geum coccineum Mrs. J. Bradshaw, two excellent varieties of their respective kinds.

THE KING'S ACRE NURSERIES, Hereford, exhibited a batch of Eremurus Olgoe, including an albino form, which received an Award of Merit.

Exhibits of hardy flowers were also shown by Mr. G. REUTHE, Keston, Kent (Bronze Flora Medal); Messrs. W. WARE, LTD., Feltham; Messrs. G. & A. CLARK, LTD., Dover; Mr. A. J. HARWOOD, St. Peter's Nursery, Colchester.

A bunch of the blue-flowered Salvia Sclarea was shown by Mrs. MARTINEAU, Hurst Court, Twyford.

AWARDS OF MERIT.

Eremurus Olge alba.—This variety has pure white flowers, but in other respects is very similar to *E. Olge*. Collected at an altitude of 7,000 feet in North Persia, the plant was presented as new under the name of *E. Setonii alba*, but in the glaucous character of its leaves the manner of growth, and time of flowering, it was unanimously thought to be a variety of *E. Olge*. (KING'S ACRE NURSERIES, Hereford.)

Carnation James Quinn.—A fancy Carnation with a buff ground suffused with crimson-red.

C. King George.—A perfectly white flower of spotless purity and high excellence. This is one of the varieties named by her Majesty the Queen at the time of the Coronation.

C. Dora Blick.—This is a remarkable flower in every way and probably unique in shade. It has been described as "terra-cotta," but, in addition to this, there is an unmistakable suffusion of pale orange. The novelties described above were shown by the raiser, Mr. CHARLES BLICK, Hayes Nurseries, Kent.

Canna Frau E. Kracht.—A striking and beautiful novelty of the highest merit and of that salmon-rose shade seen in the border Carnation Lady Hermione. The variety possesses a free branching habit, and the flowers are very large. (Messrs. JAMES VEITCH & SONS, LTD., Chelsea.)

Carnation Herbert Newman.—A white-ground border variety, with the petals striped with scarlet. The flowers are of large size and good form. Judged by its 2½-feet-long stems, the plant would appear to be one of exceptional vigour. (Mr. A. F. DUTTON, Iver, Bucks.)

C. Mrs. Elliott Douglas.—A border variety of rich golden yellow; the flower is handsome and well proportioned. (Mr. JAS. DOUGLAS.)

C. Mrs. Andrew Brotherstone.—This variety may be best described as a crimson "fancy," the ground colour being copiously freckled with white. The flower is of large size, and the petals possess unusual substance. (Mr. JAMES DOUGLAS, Great Bookham.)

Rose Nerissa, H.T.—A Hybrid Tea Rose of a deep shade of cream, with a suffusion of pink. (Messrs. WM. PAUL & SON, Waltham Cross.)

Fokienia Hodginsii (see *Gard. Chron.*, Feb. 4, vol. xlix., p. 66, figs. 32, 33, 34, 35).—Miss WEBBURN, Barnet, exhibited plants of this new genus of Coniferae, varying from 6 inches to about 12 inches high. These particular plants were received a few weeks ago from China.

Plagianthus Lyallii (see fig. 27).—A beautiful New Zealand flowering shrub belonging to the Malvaceae. It has proved to be quite hardy in many diverse parts of Britain. The pure-white flowers have clusters of golden anthers, and the blooms are produced from the axils of the growths made in the previous year. See also *Gard. Chron.*, May 25, 1907, p. 335. (C. J. LUCAS, Esq., Horsham.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, de B. Crawshay, Gurney Wilson, W. Bolton, J. Wilson Potter, R. G. Thwaites, A. A. McBean, W. H. Hatcher, W. Cobb, J. Charlesworth, J. E. Shill, F. J. Hanbury, C. J. Lucas, W. H. White, and Sir Jeremiah Colman, Bart.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed a magnificent plant of the violet-coloured *Dendrobium Victoria Regina*, which secured a First-class Certificate and Cultural Commendation—the only Awards of the day. Sir TREVOR LAWRENCE also showed sprays of the new *Javan Dendrobium Annae*, with large, blush-white flowers, having an orange disc to the lip, allied to *D. mutabile*, which was also shown.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a finely-blotched form of *Odontoglossum waltoniense*; a fine purple-tinted form of *Odontoglossum rosefieldensis*; and *Odontioda Nemesis* (*O. Hallii* × *C. Noezliana*).

F. J. HANBURY, Esq., Brockhurst, East Grinstead, sent *Cattleya Miss Harris* "Brockhurst variety," finely veined and tinged with deep rose.

MESSRS. CHARLESWORTH & CO., Haywards Heath, staged a select group containing a very bright yellow form of the handsome *Anguloa*

Cliftonii, with three very large flowers; the new white-petalled *Cattleya Alcimeda* (Gaskelliana *alba* × *labiata* Gilmoreae), *Laelio-Cattleya Sibyl* (*C. Mendelii* × *L.-C. Dominiana*), a beautiful hybrid, with flowers much resembling those of the favourite *Cattleya Octave Doin*; *Sophro-Laelio-Cattleya Pandora* (*S.-L. heatonensis* × *C. Dowiana Rosita*), with bronzy-yellow sepals and petals; the rare *Cymbidium Huttonii*, two very bright blue forms of *Vanda coerulea*; *Stanhopea oculata*, *Cirrhaea viridissima*, *Satyrium coriifolium*, and a very pretty white *Satyrium*, with crimson lines, *Vanda Agnes Joaquim*, and some good *Odontoglossums*, including the fine white *O. ardentissimum xanthodes*.

MESSRS. SANDER & SONS, St. Albans, showed a very interesting group of *Cattleyas*, *Laelio-Cattleyas*, *Odontoglossums*, &c., specially good being *Stanhopea inodora*, with seven flowers on a spike, *Catasetum maculatum*, *Cycnoches peruvianum*, *Dendrobium Regium*, *Cattleya Rex*, with six flowers, the clear blue-lipped *Zygopetalum Sanderæ*, *Bollea celeste*, *Ancistrochilus Thompsonianus*, *Bulbophyllum barbigerrum*, and many other interesting species, including a very remarkable new *Gongora*, not yet determined. Hybrid Orchids included *Brasso-Cattleya Mrs. J. Leeman*, *B.-C. Thorntonii*, and other *Brasso-Cattleyas*. (Silver Banksian Medal.)

FIG. 28.—DENDROBIUM VICTORIA REGINA: FLOWERS BLUE.

(Awarded R.H.S. First-class Certificate on Tuesday last.)

MESSRS. STUART LOW & CO., Bush Hill Park, staged an interesting group, at the back of which were several species of *Oncidium*. The centre was of red *Renanthera Imschootiana* and *Epidendrum vitellinum*, arranged with scarlet *Disa grandiflora*. Among others noted were the showy *Stanhopea tigrina*, *Physosiphon Loddigesii*, with many sprays of orange-coloured flowers, *Odontoglossum Sanderianum*, with several spikes, several fine *Cattleya Warscewiczii*, *Masdevallia Veitchii grandiflora*, *M. calura*, and *M. Peristeria*, *Miltonia Warscewiczii*, *Epidendrum patens*, and *E. Brassavolae*. (Silver Banksian Medal.)

MESSRS. J. & A. A. McBEAN, Cooksbridge, staged an effective group, in which were several very fine forms of *Odontoglossum crispum*, including the clear white *O. c. xanthodes* Peeter's variety. Several plants of *Cattleya Warscewiczii*, including a very fine form of the variety *imperialis*, a very beautiful milk-white *Miltonia Hyeana*, with violet lines in front of the yellow base of the lip, *Cochlioda St. Fuscien*, and *C. Charlesworthii*, with several bright scarlet forms of their parent *Cochlioda Noezliana*, were also included.

Baron BRUNO SCHRÖDER, The Dell, Englefield Green (Orchid grower, Mr. J. E. Shill), showed the handsome *Laelio-Cattleya elegans* Broomeana, one of the finest forms of the favourite natural hybrid. The flowers were large, rose-purple, with broad, purplish-crimson front to the lip.

The plant flowered originally in the collection of the late Joseph Broome, and was described in the *Gardeners' Chronicle*, September 11, 1897, p. 174.

AWARDS.

FIRST CLASS CERTIFICATE

Dendrobium Victoria Regina, from Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White).—This is the blue *Dendrobium* of Manila described in the *Gardeners' Chronicle*, June 19, 1897, p. 399, and figured August 21, 1897, when it had received an Award of Merit at the Royal Horticultural Society. The plant now shown was much superior, and hence the higher Award.

CULTURAL COMMENDATION.

To Mr. W. H. White, Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O., for a grand specimen of *Dendrobium Victoria Regina*, with over 30 spikes of violet-blue flowers, with white centres. The plant was grown in the *Odontoglossum* house.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (Chairman); and Messrs. J. Cheal, C. G. A. Nix, W. Bates, F. Perkins, A. Dean, E. Beckett, T. Coomber, G. Reynolds, G. Wythes, J. Harrison, O. Thomas,

J. Davis, W. Poupart, J. Jaques, and H. Markham.

MESSRS. GEORGE BUNYARD & CO., LTD., Maidstone, showed *Cherries Cleveland Bigarreau* and *Monstrueuse de Mezel*, the former being a new variety. It was decided that members of the Committee should inspect the tree of *Cleveland Bigarreau* and furnish a report at the next meeting.

Fruits of the "Lowberry," from plants in the open, were shown by Messrs. STUART LOW & CO., Bush Hill Park, Enfield. The Phenomenal Berry was declared by the Committee to be the same as the Loganberry. A black Raspberry, shown as Cumberland Black Cap, was also exhibited by Messrs. STUART LOW & CO.

LORD LLANGATTOCK, The Hendre, Monmouth (gr. Mr. T. Coomber), exhibited 23 handsome fruits of *Queen Pines*. (Silver-gilt Knightian Medal.)

THE SWANLEY HORTICULTURAL COLLEGE displayed 24 round, well-netted Melons under the name of College Seedling. The plants had been grown in small boxes, but they produced a large crop. (Silver Knightian Medal.)

MESSRS. JAMES VEITCH & SONS showed from their Langley Nurseries a collection of 50 baskets of Gooseberries backed by numerous trellis-cordons and heavily-fruited bushes in pots. The finest plants were of the varieties *Lancashire Lad*, *Whinham's Industry*, and *Keen's Seedling*, all

red sorts, and of yellow kinds Golden Queen, Peru, Langley Beauty, and Gunner. Of the gathered fruits, Clayton, Alderman, Lord Audley, Highlander, and Forester (red), and Gipsy Queen, Early Sulphur, Gunner, Langley Beauty, Keepsake, Criterion and Whitesmith (yellow) are a selection. (Silver-gilt Knightian Medal.)

AWARDS OF MERIT.

King's Acre Berry.—Fruits were exhibited at a previous meeting, and a deputation of the Committee having inspected the plants and reported favourably, an Award of Merit was recommended. (KING'S ACRE NURSERIES, Hereford.)

The following varieties of Peas received Awards of Merit, after trial at Wisley, where they were inspected by a sub-committee on the 17th inst.: The Caithness and America (these two from Mr. HOLMES); Eureka, King Edward and Matchless Marrowfat (these three from Messrs. SUTTON & SONS); Bell's Premier (BELL & BIERSTEDT); The Cottager (Mr. YATES).

NATIONAL SWEET PEA.

INSPECTION OF THE TRIALS.

JULY 13.—There was considerable discussion last winter among the members of the National Sweet Pea Society as to the composition of their Floral Committee, whose duty it is to visit the trials at the *Times* Experimental Station, Sutton Green, Guildford. Ultimately, it was decided that the committee should consist of nine members elected by ballot by the general committee. The nine chosen were Mr. Robert Bolton, Mr. S. B. Dicks, Mr. George Herbert, Commandant Humphery, R.N., Mr. Andrew Ireland, Mr. Thomas Jones, Mr. A. Malcolm, Mr. Herbert Smith, and Mr. Thomas Stevenson. Mr. Malcolm was elected chairman, and two visits were paid to the trials, a week intervening between them.

On Thursday, the 13th inst., the Society made its annual inspection. About 100 members travelled from London, and soon after arrival were engrossed in the trials. These have been carried out by Mr. Harry Foster, son of the late Mr. Charles Foster. A new and better method of planting has been adopted this year by which the colours are classified, and follow one another in long lines. Considering the recent dry weather the plants were in very good condition; 4 to 6 feet tall with abundance of medium-sized flowers.

The first object of the trials is to discover novelties; the second, but almost equally important, being to report which stocks are pure. The latter object can be attained, even though the flowers are small, but before giving awards to novelties they ought to be seen at their best. We believe the Floral Committee on the occasion of its two visits saw the flowers in better condition than they presented to the members of the general outing. Very many of the 268 stocks on trial are impure. This is, of course, explained by so many of them being novelties, which the owners send in the hope that they will come true and gain one of the much coveted certificates or awards. At the head of each section is grown the variety considered by the committee last year as the best in the section. These, we were pleased to see, were mostly quite true, showing that seedsmen are taking more pains with their general stocks. For the first time the Floral Committee has acknowledged by an Award stocks giving one rogue in a row.

It will give readers interested in Sweet Peas an idea of what is coming along if I give a few notes of distinct varieties made on the spot. The numbers are those of the trial in the official list:—

Nos. 3 and 4.—Lavender-coloured flowers from R. Bolton, evidently Afterglow or selections of same. Distinct and much waved.

No. 12.—Lavender colour from Dobbie & Co., the variety they have been showing under the name of Mrs. Heslington. True.

No. 27.—A shade of lilac from R. Bolton; a very fine flower.

No. 28.—Heliotrope-pink, from W. Deal; true, like Winsome.

No. 33.—F. Seymour Davis, white-flushed palest violet. A distinct and fine flower. Award of Merit. From F. Seymour Davis.

No. 43.—Mauve, from Dobbie & Co. Granted an Award of Merit and named "Mauve Queen."

No. 72.—Doris Usher Improved, from Sutton & Sons; an excellent stock of this fine Pea.

No. 73.—Cream Rose, from R. Holmes. A remarkably fine, pale rose-coloured flower.

No. 76.—Lady Betty, from C. W. Broommore. In the way of Charles Foster; a fine stock.

No. 92.—Isabel, from Mr. Aitkens. A new colour, but not very vigorous.

No. 98.—Orange Pink, from Dobbie & Co. A fine strain of H. Lewis with cream-coloured base.

No. 109.—Earl Spencer, from Dobbie & Co.; a very excellent stock.

No. 111.—Salmon, from R. Holmes, was awarded the distinction of a First-class Certificate and named "Barbara." It is fixed and true to type, and a first-rate flower.

No. 116.—Orange, from A. Malcolm. This is a large, rather pale Earl Spencer, and may be Melba as shown by Dobbie & Co.

No. 119.—Orange-scarlet, from Dobbie & Co. Awarded First-class Certificate, and reserved for Silver Medal next year if it keeps true. Almost identical with Thomas Stevenson, hence it was named Dobbie's Thomas Stevenson. It must have been the finest Pea when the Floral Committee paid its visits.

No. 130.—A. A. Fabius, from Mr. Agate. Fine colour, similar to Edith Taylor, though not quite fixed, well worth growing.

No. 137.—Vermilion brilliant, from Alex. Dickson & Sons. A very bright scarlet; true.

No. 133.—Red Sar, from A. Malcolm. Received the Award of Merit as the best scarlet on the occasion of the Committee's visit.

No. 140.—Scarlet, from R. Holmes; a very good flower.

Nos. 141 and 142.—Scarlet Monarch, from William Deal; good stocks of this well-known scarlet.

No. 148.—Paradise Red Coral, from Miss Hemus. A magenta Marjory Willis. Some very large and fine flowers in this selection.

No. 150.—Crimson, from R. Bolton. This is the deepest crimson yet seen.

No. 161.—Improved John Ingman, from Dobbie & Co.; a first-class flower.

No. 174.—Purple Prince Spencer, from Sutton & Sons; true and good stock.

No. 178.—Red Chief, from R. Bolton. Does not seem the same as last year's stock. Only a good crimson this year; last year it was a mahogany colour.

No. 182.—Ivy Herbert, from C. W. Broommore, is a darker Merrie Christie; true.

No. 196.—Blue Jacket, from Stark & Son; though entered as a Lord Nelson Spencer is an excellent Navy Blue Spencer.

No. 211.—Marbled, from Dobbie & Co., received an Award of Merit and named "May Campbell"; is cream marbled with carmine.

No. 212.—"Mrs. B. Gilbert," from Gilbert & Son (not Dobbie & Co., as stated on p. 38), received an Award of Merit. It is a white ground marbled with purplish-mauve.

No. 214.—Loyalty, from Stark & Son, is a dark marbled Blue Spencer. Several stocks were grown, but this was the best.

No. 227.—Cream and Rose, from E. W. King & Co., is a grand grower, but not yet fixed.

No. 234.—Paradise Peach Blossom, from Miss Hemus, is a large flower of pale but warm lavender.

No. 250.—A bicolor, from Dobbie & Co., seemed distinct and a strong grower.

No. 251.—Colleen, from W. Deal, was most showy and quite true.

A large number of Helen Pierce variations, some of them of the Spencer type, were on trial. Mr. Deal seems to specialise in these, but they must be increased in size before they can hope to receive the attention of exhibitors.

The party was entertained to lunch and tea by Lady Northcliffe, who is this year President of the Society. Her ladyship received the members at the entrance to the luncheon tent and presided at the lunch. In a graceful speech she welcomed the Society to Sutton Green, and expressed the pleasure that under her presidency the membership was increasing. The other speakers were Mr. Alfred Watkins, Mr. W. Atlee Burpee, and Mr. W. Cuthbertson, who paid a tribute to the late Mr. Charles Foster.

EALING HORTICULTURAL.

JULY 5.—Through the kindness of Leopold de Rothschild, Esq., the 47th annual exhibition of the Ealing Horticultural Society was held at Gunnersbury Park. The privilege of inspecting these beautiful grounds on such a fine day induced a large number of visitors to attend the show. Immediately inside the chief tent Mr. REYNOLDS arranged a fine group of stove and greenhouse plants from the Gunnersbury Park glasshouses. This group contained some large, highly-coloured Acalyphas and Crotons, and several well-flowered Ixias. At the other end of the tent, Mr. HUDSON staged from the Gunnersbury House gardens a group of large standard Plums, loaded with luscious-looking fruits; beneath the fruit trees there were bowls of large blue Nymphaeas. Other non-competitive contributions included a collection of variegated Maples, standard Fuchsias, Dracenas, and Aralias from Messrs. W. FROMOW & SONS, Chiswick; a well-coloured group of Mr. RUSSELL's standard Ivies, from Richmond; a huge display of splendid Sweet Peas, by Messrs. TIGWELL, Greenford, Middlesex; and a high-class stand of cut blooms of such Roses as the Lyon Rose, Her Majesty, and Mrs. Roosevelt from Mr. GEO. CANNON, Ealing Nurseries.

The 1st prize for a group of plants filling a semi-circular space of 12 feet by 6 feet, was won by H. W. PEAL, Esq., Ealing (gr. Mr. C. Edwards), with a tasteful arrangement; 2nd, A. W. PERKINS, Esq., Greenford.

The 1st prize for smaller groups was awarded to Mrs. UNDERHILL.

H. W. PEAL, Esq., staged some immense Strep-tocarpus, bearing a quantity of huge flowers of good colour.

The open classes for Roses brought some very fine blooms, such well-known Rose exhibitors as Mr. E. HICKS, Wallingford; Messrs. W. & J. BROWN, Stamford; and Messrs. G. & W. BURCH, Peterborough, staged exceedingly good collections in the principal class, and won in the order named. This seems to be a Lyon year, and that beautiful Rose was in perfection in each stand, while Ben Cant, Mildred Grant, and Earl of Warwick were other outstanding varieties in the best exhibits.

FORMBY HORTICULTURAL.

JULY 12.—The annual show of the above society was held in the grounds of Briar's Hey, the residence of Mrs. F. A. Rockliff, on this date. The number of entries and quality of the exhibits were fully up to the average for these shows, but the hot weather soon caused the cut blooms to wither, Sweet Peas being the least affected.

The best exhibit of 12 Roses of distinct varieties was shown by Mrs. ROCKLIFF, Caroline Testout, Killarney, and Mrs. W. J. Grant being prominent varieties.

The premier collection of 12 Roses in six varieties was shown by Mr. JOS. BOOTH, whilst Mr. THOS CARLISLE led for six varieties, distinct.

Mr. H. HODGKINSON excelled in the class for six light-coloured Roses, and in the similar class for dark varieties Mr. E. HACKING was the winner of the 1st prize.

Other winners of 1st prizes in the Rose classes were Mr. F. W. PASSMORE, Mr. A. E. GUNSON, Mrs. ROCKLIFF, Mrs. STOREY, Mr. B. KENNEDY, Mr. A. W. ARDRAN, Mr. THOS PUGH, Mr. LOO THOMSON, Mr. W. BECKETT, and Mr. JONES.

The 1st prize for six blooms of double-flowered Begonias was won by Mr. F. A. COOK, and Mrs. GAYN excelled for single-flowered varieties. Mr. W. MCCONNAN had the best single Pelargoniums, Mr. W. DODD the finest Pansies, and Mr. JONES the choicest Violas.

Mr. J. GILBOURNE won the 1st prize offered for biennials and annuals, and he also showed the finest hardy perennials.

Sweet Peas proved a strong feature of the show, and the plant classes were well contested.

In the fruit classes many exhibitors were disqualified for not conforming to the conditions of the schedule. Mr. T. NORRIS won in the principal class for vegetables.

Amongst non-competitive exhibits, Messrs. A. DICKSON & SONS, Newtownards, contributed a capital stand of hardy flowers and Roses. Mr. H. MIDDLEHURST showed Sweet Peas, and Messrs. WOODWARD & CUTHBERT hardy herbaceous flowers.

GLOUCESTERSHIRE ROSE AND SWEET PEA.

JULY 4.—The 23rd annual exhibition of the Gloucestershire Rose and Sweet Pea Society was held in the Spa Cricket Field, Gloucester, on this date in fine weather. The exhibits numbered more than 400, and, as Mr. Conway Jones remarked at the opening ceremony, considering the extraordinary season, the Roses were of excellent quality and in greater number than was expected.

Messrs. ALEX. DICKSON & SON, Newtownards, provided quite a Rose exhibition of their own, and in the five classes in which they showed, they secured four 1st prizes. Their collection of 72 varieties was an exceedingly fine exhibit, among the most notable blooms being George Dickson, Mollie Sharman Crawford, Mabel Drew, Lady Helen Vincent, George C. Waud, Mrs. Cornwallis West, and Brilliant.

In the class for 12 blooms of a light Rose, Messrs. DICKSON won the 1st prize with the variety Mrs. Theodore Roosevelt.

The best exhibit of 12 blooms of a dark coloured Rose was shown by Mr. JOHN MATTOCK, Oxford, namely J. B. Clark, whilst Mr. HARRY DREW, Longworth, secured the premier

Sweet Peas were a conspicuous feature of the exhibition, the prizes attracting many well-known competitors. The entries numbered close upon 300, a big advance on previous years. The six vases shown by Mr. JARRETT THORPE, for which the Winfield Challenge Cup was awarded, were filled with splendid flowers. Among the newer varieties Mrs. R. Hallam, Edna Unwin, Marjorie Linzee, Miriam Beaver, and Bertie Usher, appeared to be general favourites among exhibitors, while of the older sorts Elsie Herbert, Helen Lewis, Mrs. Charles Foster, Tennant Spencer, Etta Dyke, Clara Curtis, Evelyn Hemus, and Paradise Ivory compared very favourably with the newer varieties.

Mr. A. STIRLING, Goring-on-Thames, and Sir RANDOLPH BAKER, Ranston, Blandford, won most of the 14 premier honours in the open classes, Mr. STIRLING winning the Cup for 24 distinct varieties. Col. TIMMIS, of Matson House, Gloucester, was awarded the National Sweet Pea Society's medal for 12 distinct varieties in the class restricted to Gloucestershire amateurs. Mr. W. J. UNWIN, Histon, Cambridge, was awarded a gold medal for a magnificent display of Sweet Peas. Messrs. J. C. WHEELER & SON, LTD., Gloucester, were awarded a gold medal for

ELSTREE AND BOREHAM WOOD HORTICULTURAL.

JULY 12.—The third annual summer show of this society, held on the above date, was a considerable improvement upon the two previous exhibitions. The society is fortunate in being granted the use of Aldenham Park for these shows, and the gardens and pleasure grounds are open to the inspection of visitors. This year the show was held in two large marquees, one being reserved for the honorary exhibits and the other for exhibits of cottagers and amateurs.

A class for table decorations, open to ladies, brought several competitors, and made a good display, the 1st prize being won by Miss HART, for an artistic arrangement of Carnations.

The classes for Begonias, Gloxinias, table plants, Ferns, &c., were well filled, as were those in the amateurs' and cottagers' sections.

A silver Rose bowl was offered in competition for a display of Roses, but Messrs. R. HARKNESS & Co., of Hitchin, were the only exhibitors. They staged a remarkably fine exhibit in a pleasing and attractive style. Other Roses were also well shown by trade exhibitors, including Messrs. W. CUTBUSH & SON, Highgate; Messrs. GEO. PAUL & SON, The Old Nurseries, Cheshunt; and

FIG. 29.—A WATER-GARDEN EXHIBITED BY THE HON. VICARY GIBBS AT THE ELSTREE SHOW.

award in the class for 18 varieties in single trusses.

In the open amateur classes Mr. CONWAY JONES, Hucclecote, Gloucester, continued his successes, his prizes including the Silver Challenge Bowl, valued at 30 guineas, offered for 36 varieties. In this collection the judges found the best bloom in the division—Dean Hole—which was awarded a National Rose Society's silver medal. A novelty in the exhibit was a new seedling raised by Mr. CONWAY JONES, and named after Mr. T. A. Washbourn, a former hon. secretary of the society and in earlier years a most successful exhibitor. The new variety is a beautiful crimson Hybrid Perpetual. In the city of Gloucester amateur division Mr. A. V. WRIGHT carried off the Corporation Plate for a display of Roses, and also the Sheriff's Plate for six varieties, and a National Rose Society's silver medal with a fine bloom of White Maman Cochet. Mr. JARRETT THORPE, of Hucclecote, Gloucester, and Mr. DODWELL, Hereford, were also awarded National Rose Society's silver medals for best blooms, with J. B. Clark and Mildred Grant respectively.

a general floral display; Messrs. YOUNG & Co., Cheltenham, received a gold medal for Carnations, and Messrs. WINFIELD, Gloucester, received a medal for a collection of Sweet Peas.

DUTCH BULB GROWERS', HAARLEM.

The following awards were made at the recent meetings of the Floral Committee:—

AWARDS OF MERIT.

Iris hispanica "Amethyst."—A variety with soft blue and violet-coloured flowers, the lip being light blue and spotted with orange and yellow.

Iris anglica "Alexandre Dumas."—A large, azure-blue flower spotted with dark indigo; the lip has a large white spot, and stripings of yellow.

Iris Kämpferi "Wasaka."—A flower of extraordinary size and coloured dark purple.

Anemone single "L'Unique."—The flowers of this novelty are coloured salmon rose, the petals being broad and round.

Messrs. EASON BROS., Barnet. Other trade exhibitors included Messrs. NEWMAN & SON, of Watford, who showed 150 vases of Sweet Peas; Messrs. GLEESON & Co., who staged hardy perennials; Messrs. SANDER & Co., St Albans, who staged their new Marguerite Mrs. F. Sander, and also a most attractive display of Orchids.

The President, the Hon. VICARY GIBBS (gr. Mr. E. Beckett, V.M.H.), showed two honorary exhibits. One consisted of a superb collection of vegetables, staged in Mr. Beckett's well-known style, and including excellent dishes of Peas, Potatoes, Marrows, Artichokes, Beet, Cauliflowers, &c. The other consisted of a water-garden exhibit (see fig. 29). At the back, were large clumps of Typhas, Bamboos, and other large-growing Reeds, interspersed with clumps of Delphiniums, Epilobium, Lythrums, and other tall flower-spikes. Around the sides and front were arranged Astilbes, *Iris Kämpferi*, Saxifragas, and Liliums, whilst choice Nymphæas were planted in the water.

H. T. TATHAM, Esq., Kendall Hall (gr. Mr. Wm. Gaiger), showed a meritorious collection of Sweet Peas of the newer varieties.

E. GREENWOOD, Esq., Frith Knowl (gr. Mr. G. Capell), staged a group of miscellaneous flowering and foliage greenhouse plants.

Mr. THOS. HINE also had an honorary exhibit of Sweet Peas, the flowers being much admired.

The hon. treasurer, the Rev. A. R. T. Yates, the hon. secretary, Mr. W. J. Pritchard, and committee are to be congratulated on the general success of the show.

The society's autumn show, principally of fruits and vegetables, is fixed for September 16.

PURLEY ROSE AND HORTICULTURAL.

JULY 15.—The annual summer show of this society was held in the charming grounds belonging to the President, Mr. William Webb, on this date. In the nurserymen's classes great interest was centred in the competition for the Purley Challenge Cup. This award is presented by Mr. J. Ivall for 36 Roses, distinct. Messrs. B. R. CANT & SONS, Colchester, won the trophy, the 2nd prize being awarded to Messrs. R. HARKNESS & Co., Hitchin.

The National Rose Society's Silver Medal (presented by A. E. Protheroe, Esq.) for the best Rose in the amateurs' section, was won by A. TATE, Esq., Leatherhead, for a grand bloom of Bessie Brown. The same exhibitor was also the winner for the year of the Ladies' Challenge Trophy (presented by the ladies of Purley).

J. IVALL, Esq., Purley (gr. Mr. Russ), won the 1st prize for a group of flowering and foliage plants arranged for effect. 2nd, A. BATES, Esq., High Burrow, who won the 1st prize for six plants suitable for table decoration.

Many trade exhibitors were present, and their exhibits increased the general attractiveness of the show. Messrs. FLETCHER BROS., Chertsey, exhibited Roses and hardy flowers; Messrs. WELLS & Co., Merstham, showed Carnations, Phloxes, and other border flowers; Messrs. GEO. JACKMAN & Co., Woking staged hardy flowers, and Messrs. CARTER PAGE & Co. put up an exhibit of Dahlias and Sweet Peas.

A Silver-gilt Medal was awarded to Mr. BRAZIER, Caterham, for an exhibit of Begonias, Phloxes, Roses, and some specially good Carnations. Mr. H. LAKEMAN, Thornton Heath, exhibited Carnations attractively. Mr. T. BUTCHER, The Nurseries, South Norwood, arranged a group of greenhouse plants. THE GUILDFORD HARDY PLANT CO. and Messrs. GEO. BUNYARD & Co., LTD., Maidstone exhibited some cut hardy flowers. Some excellent Sweet Peas were exhibited by Mr. JAS. BOX, Lindfield, who also staged good varieties of hardy Phloxes. Against a suitable background of Fern-fronds Mr. A. L. GWILLIM, Sidcup, displayed a selection of double, single and crested Begonia blooms.

NORTH HANTS. SWEET PEA.

JULY 15.—The fifth annual show of this society was held, at the invitation of Mr. and Mrs. Alfred Palmer, at Wokefield Park, Mortimer, on the above date. Twenty-four classes were provided, and there were over 250 entries. The premier prize for 15 bunches of distinct varieties was won by Mr. A. L. COOK, and the N.S.P.S. medal, given by Mr. F. Mason Good, went to Mrs. Evelyn Hemus. Altogether the display was well worthy of the society, which, although it is only a small private society, has done much for the cult of the Sweet Pea in this district, and reflects great credit on the founder, the Rev. F. Page Roberts, who still acts as hon. secretary and general organiser.

NATIONAL GLADIOLUS.

JULY 18.—The first exhibition of this newly-established floral society was held in conjunction with the fortnightly meeting of the Royal Horticultural Society in Vincent Square, Westminster, on Tuesday last. The schedule comprised nine classes, seven of these being restricted to nurserymen. The competition was very limited. Three exhibitors entered in the various nurserymen's classes, whilst the open classes were practically neglected. In all but two classes medals constituted the prizes.

The first class was for 12 varieties early-flowering Gladioli, six spikes of each variety to be

shown in 12 vases. Mr. FRANK LILLEY, Guernsey, was the only exhibitor. He showed varieties of *G. nanus*, and was awarded the silver medal offered as the 1st prize.

In a class for the same number of varieties of early or late-flowering varieties, Messrs. KELWAY & SON, Langport, Somerset, won the 1st prize, their finest varieties being Theodora (orange-red), Lady Muriel Digby (cream-lemon and crimson), and Conway Seymour (reddish scarlet); 2nd, Mr. K. VELTHUYS, Hillegon, Holland.

There were three entries in the class for a group of Gladioli, any varieties, arranged with any foliage, in a space not exceeding 5 square feet. The 1st prize was awarded to Messrs. KELWAY & SON, the 2nd to Mr. LILLEY, and the 3rd to Mr. VELTHUYS.

Messrs. KELWAY won the 1st, 2nd and 3rd prizes in the class for three spikes of a new Gladioli with the varieties Cecilia Kelway, Bala, and James William Kelway respectively.

Mr. LILLEY was the only exhibitor of six blooms of any Gladiolus shown in a vase, whilst the secretary, Mrs. ATKINSON, had the Flagstaff, Locksheath, Southampton, won the best basket of Gladioli with the variety America.

AWARDS OF MERIT.

Gladiolus James William Kelway.—Of the gandavensis type, the flowers being a rich velvety-red. A glorious flower in both size and colouring.

G. Cecilia Kelway.—Also a large-flowered variety, the petals being rose, shading to a paler centre; the lower segments lemon, blotched with red. Both shown by Messrs. KELWAY & SON.

ENQUIRIES AND REPLIES.

WHICH IS THE BEST BOILER?—In reply to the query on this subject by J. C. (see vol. xlix., p. 380), I find the Chatsworth boiler the best and most economical boiler for heating in small places, if set on four bricks with flues all around. I have just replaced one that has been in use for 17 years. The length of this boiler is 42 inches by 18 inches by 18 inches, and it has to heat about 1,150 feet of 4-inch piping. The cost for fuel averages £13 to £14 per annum. We use small coke from cinder ovens. Our houses here are stove, greenhouse, early and late vinery, Croton house, intermediate Orchid house, cool Orchid house, and Tomato house, besides one span-roofed frame and pits. All these are heated from the one boiler. The fire will burn almost anything that is put on it. F. G. Skelton, Mount Pleasant Gardens, Bishop Auckland.

ANSWERS TO CORRESPONDENTS.

APPLE SHOOT DISEASED: D. K. The trouble is due to canker. Spray the trees next season with the Bordeaux mixture at half strength when the leaves are expanding, and again when the fruit is set.

BEGONIAS FAILING: F. B. The damage is caused by eelworm at the roots, for which there is no cure.

CARNATION SEEDLING: Seashore. Your Carnation is a seedling form of a fringed, and probably double variety of *Dianthus Caryophyllus*. The varieties of the best florists' type always produce about 10 per cent. to 15 per cent. of single flowered varieties, but the margins of the petals are not fringed. The slender stems rather suggest *Dianthus plumarius*, but this cannot be determined without seeing the growth of the plant. The flowers are as large as those of the single-flowered Carnations, and possess a Carnation scent.

DIANTHUS BARBATUS AND CAMPANULA MEDIUM: Perplexed. The Sweet William has been killed by eelworm. The soil should be treated with quicklime, or, better still, with gaslime, and allowed to lie for a few months before use. There is no trace of disease in the Canterbury Bells.

GRAPES UNSATISFACTORY: W. A. G., R. J. F., and J. D. No disease is present. The unsatisfactory appearance of the berries is due to the cultural treatment.

MELON DISEASE: X. Y. Z. The plant is affected with Melon-leaf blotch. Spray the foliage on alternate days with liver of sulphur, one ounce in two gallons of water.

NAMES OF PLANTS: F. M. W. The fruiting specimen is *Hypericum Androsæmum*; the other is *H. elatum*.—W. Honess. *Daphne Mezereum*.—A Regular Reader. 1, *Thuya plicata*; 2, *Magnolia* (probably *M. obovata*); 3, *Olearia Haastii*; 4, *Abies*; the specimen is too poor for identification; 5, *Aucuba japonica salicifolia*.—Fakam. 1, Rose, send to some grower; 2, *Helichrysum orientale*; 3, *Clematis recta*; 4, *Geranium sanguineum*; 5, *Lythrum salicaria*.—A. P. S. 1, *Campanula carpatica*; 2, *C. linifolia*; 3, *C. rhomboidalis*; 4, *C. pusilla*; 5, *C. alliariaefolia*.—F. B., Boldenden. *Galium verum*; Lady's Bedstraw.—W. T. & Co. *Epimedium pinatum*.—W. Fulford. 1, *Veronica speciosa alba*; 2, *Iris* sp. (too withered for identification); 3, *Achillea alpina*.—A. B. C. 1, *Rheum palmatum*; 2, *Epilobium angustifolium*; 3, *Campanula latifolia*; 4, *Stachys sylvatica*; 5, *Symphytum tuberosum*; 6, *Spiraea tomentosa*; 7, *S. Douglasii* var.; 8, *Campanula rapunculoides*; 9, *Spiraea japonica*; 10, *Epilobium hirsutum*; 11, *Deutzia crenata* fl. pl.—W. R. P. 1, *Lactuca Plumieri*; 2, *Potentilla recta macrantha*; 3, *Cytisus canariensis*.—J. D. 1, *Lotus corniculatus*; 2, *Prunella vulgaris*; 3, *Potentilla Tormentilla*.—R. V. & Son. *Coronilla varia*.—J. D. *Poa nemoralis*, L.—O. R. 1, *Oncidium unicorn*; 2, *O. sphacelatum*; 3, *Odontoglossum Sanderianum*; 4, *Brassia verrucosa*; 5, *Oncidium flexuosum*; 6, *Angraecum arcuatum*.—H. T. 1, *Pteris tremula*; 2, *Adiantum tenerum*; 3, *A. formosum*; 4, *Cheilanthes elegans*.—W. E. B. *Magnolia glauca* var. major figured in the *Botanical Magazine*, t. 2164.—E. S. 1, *Cœlogyne cristata*; 2, *Odontoglossum pulchellum*; 3, *Dendrobium nobile*; 4, *Cypripedium villosum*; 5, *Oncidium species*; 6, *Cymbidium Lowianum*; 7, *Cypripedium barbatum*. The above are the names of the pieces of Orchids sent so far as we can judge without seeing flowers. All the specimens show indications of having suffered for want of sufficient water. Use rain-water if possible.

NECTARINES: Dacus. The fruit has been injured by mildew. Spray the tree next season with liver of sulphur at a strength of one ounce in three gallons of water, commencing when the leaves are unfolding.—H. M. B. The leaves are injured by mildew. Spray the trees with liver of sulphur, one ounce in three gallons of water, and repeat the spraying next season when the leaves are unfolding.

SOIL FOR EXAMINATION: M. C. The sample appears to be of good quality, and contains a considerable amount of fibre, but it is rather light in texture. Try the effect of a mulching of cow manure.

"STREAK" IN SWEET PEAS. Ajax and Kent. Another season, sprinkle the soil with sulphate of potash when the plants are 3 to 4 inches high.

SWEET PEA SPORT: Sweet Pea. The variety shows no improvement on the cream-pink sorts already in commerce. There are many good varieties in this section.

TO DESTROY WIREWORMS. Ajax. The most certain method of destroying wireworms is by injecting carbon bisulphide into the soil. Pour a quarter of an ounce into a small hole about 6 inches deep. This is sufficient for each square yard. Carbon bisulphide is highly inflammable, and care is required when using it.

TOMATO: Pillingers. The leaves are affected with Tomato leaf-rust. If the fruit is present, spray the plants with liver of sulphur: one ounce in a gallon of water.

VIOLAS DISEASED: R. J. The plants are affected with Violet-rust (*Puccinia violæ*). There is no cure at this stage. Do not propagate from diseased plants. Add lime to the soil.

THROUGH LITTLE NAMAQUAL- LAND WITH THE VASCULUM AND THE CAMERA.*

IT is not easy, perhaps it is impossible, to reveal by means of pen and paper the secret of the fascination with which Namaqualand grips those who have lived or travelled there. The difficulties are the greater when one is addressing those who are favoured to abide among the green fields, the trim woods, and the choice gardens of England. In Namaqualand the sun is rarely obscured by cloud, and in the summer the joys of its rising are tempered by the thought of what must be endured before it sets. But, however intense the heat of midday, the exhilarating effect of the crisp dry air never fails. The glories of the night are not to be attempted by an ordinary pen. A rich and hardy vegetation, comprising some of the most remarkable of plant-forms, fails to clothe the nakedness of the land. The most striking feature of Namaqualand scenery is found in the bare granite domes and slopes of its mountains (see fig. 30). In the sandy plains bordering the sea or the flat, stony desert across which the country is entered from the south, it seems to be the aim of each plant to establish itself as far from its neighbours as possible. Animal life, nevertheless, abounds. Many species of antelope, the wild ostrich, the jackal, hares, and, in sandy ground, mice innumerable, are constantly seen or heard. The little Namaqua partridge is found in large coveys at every water hole. Large birds of prey are common, and, except at high elevations, snakes are abundant, though, fortunately, they are of a retiring nature. The leopard is the greatest that remains of the beasts of prey; he rarely appears, though he may be heard in the early morning,

* Being some notes on the Percy Sladen Memorial Expedition to the Orange River, 1910-11. This expedition was assisted by a grant from the Royal Society.

and after nightfall he will sometimes cause a panic among the transport animals. Man has made his mark upon many parts of the country, but the economic value of his mines and his wheatfields hardly compensate for the destruction for which, directly or indirectly, he is responsible. But for those who have a taste for the silent solitude of great, unoccupied spaces in which the harder moods of nature have free course, Namaqualand still offers some attractions.

Namaqualand, as the name is usually understood, has its southern limit somewhat to the north of the mouth of Oliphant's River, and extends northwards to the Swakop River, the old political boundary between the Namaqua tribes in the south and the Damaras or Hereros beyond. It is washed by the Atlantic on the west, and its eastern frontier lies along the edge of that part of the South Central African plateau which is known as the Kalahari on the north and Bushmanland on the south. The Orange River in its lower course traverses it from east to west, and forms the line of separation between Great Namaqualand, part of the German Protectorate on the north, and Little Namaqualand on

In a comparatively short journey we pass from the sub-tropical succulent vegetation of the dry, sandy coast-belt or of the stony desert which bounds the range on the south into the recesses of the mountains in which Heaths, Gladioli, Oxalis, Wahlenbergias, terrestrial Orchids, and brightly-flowered Composites relieve the dull monotony of Leucospermum, Cliffortias, Restiaceae, Phylicas, and other forms characteristic of the Table Mountain and the ranges which lie between it and the Karoo. In the south the rainfall is almost limited to the winter season; as we advance northwards the proportion of summer rain gradually increases. Throughout the region the principal flowering season occurs in the spring months—August to October. But as the proportion of summer rain increases, a secondary season of flowering, from December to February, becomes more and more marked. The spring flora, especially in the Khamiesberg and between this range and the Orange River, is, without doubt, but incompletely known, though it has yielded large collections of plants to Diège, Bolus and others. Few botanists have worked in the country in the

FIG. 30.—NAMAQUALAND.

A northern part of the Khamiesberg showing a granite dome bare of phanerogamic vegetation except where the rock is fissured. In the foreground are fine trees of *Acacia horrida* and *Euphorbia mauritanica*. *Aloe dichotoma* occurs near the summit.

the south. It is to Little Namaqualand that the following remarks will mainly apply.

Little Namaqualand is generally regarded as a desert, and it must be confessed that, economically, the greater part of it deserves its reputation. But away from the maritime plains, the climatic conditions are by no means those of a desert. The land rises abruptly in a series of broken granite hills and mountain ranges, culminating in the Khamiesberg, the highest peaks of which attain to nearly 6,000 feet. From the summits of these the views in all directions are difficult to describe. To the west, beyond the lower hilltops, a golden haze overhangs the sandy coast belt, and in the farther distance, some 50 miles away, the sea sends back a glittering reflection of the setting sun. In the opposite direction the mountains fall some 3,000 feet to the plains of Bushmanland, which stretch almost without a break to the horizon. To the north and south, as far as one can see, the land is thickly beset with steep mountains, whose granite peaks and ridges give little promise of the wealth of vegetation that is actually found upon them.

summer season, and it is, therefore, not surprising that the collections made by the Percy Sladen expedition in December, January and February last appear to contain a considerable proportion of forms hitherto unknown.

In the summer months surface water is scarce, and travelling with a number of animals is not without its anxieties. In the recent journey a stretch of 48 miles separated one water from the next, and distances of 20 or 30 miles frequently occur between these halting places. Given such conditions and the necessity of transporting a load varying from 1,500 to 3,000 lbs. in weight for a distance not far short of 1,000 miles in a country possessing little grass, the traveller is almost compelled to use donkeys as transport animals. A team of 12 of these useful creatures performed the journey with ease. Ordinarily they will travel 15 miles a day, but under stress of circumstances they can do 50 miles in 24 hours. The illustration in fig. 31 shows, in the background, a mountain-mass, about 30 miles to the north of the Khamiesberg, rising to 4,300 feet. A little below the summit is an extensive plateau,

which bears a rich flora. The bare granite surfaces act as water-catchment areas, and where their lower edges meet the soil the greatest density of the vegetation is found. Sometimes two of these rock slopes form the

A mountain mass of this magnitude is an important water reservoir. Fed by the winter rains from the north-west, its springs remain active throughout the dry season; on three sides of it the land is rarely free from the effects of drought.

FIG. 31.—NAMAQUALAND.

The "transport" of the Percy Sladen Memorial Expedition.

steep sides of a narrow ravine; when this is the case, the trough contains great bushes of *Erica Plukenetii* and *Muraltia rigida*, whose yellow pungent branches, frequently interlaced with those of a prickly *Cliffortia*, make travelling slow and painful; with them are found *Passerinas*, *Lachnæas*, one or more shrubby *Rubiaceæ*, a strongly-scented *Diosma*, large bushes of a *Dodonæa*, and two or three tall *Umbelliferæ* with a *Psoralea* and a *Thesium* closely resembling them in habit. These are, perhaps, the most notable elements of the bush, which rises from a groundwork of *Restiaceæ*, *Selagineæ*, *Hydrocotyle*, and a few *Grasses*. But for the absence of *Proteaceæ* and the presence in the rock crevices of many *Crassulas* and *Mesembryanthemums*, it would not be difficult to imagine oneself on the middle slopes of the mountains of the Cape, 200 miles to the south.

Fig. 32 shows the main ridge of the Khamiesberg, as seen from the south-west. One of the higher summits of the range (Sneeuwkop, 5,200 feet) appears in the background. In the middle distance is an old reed-roofed cottage (the middle one of the three buildings), which Drège is said to have visited in 1830. It is the old farmhouse known as Koets, situated about 10 miles east and a little north of Elleboogfontein, where Drège collected in August of that year. In fig. 33 the Sneeuwkop is seen from the west at a distance of about four miles from its base. From this point of view its twin peaks are fairly distinct. A number of fine examples of *Aloë dichotoma* occur on the rough northern slopes of the hill in the foreground, an aspect which is particularly favoured by this remarkable tree in the southern part of its range.

The flora of Sneeuwkop is of exceptional interest. Its upper slopes appear to receive as much, or perhaps more, rain than the higher peaks of the range; this is probably due to its more westerly situation. It is quite possible that a number of the species which occur—or did occur—on Sneeuwkop are not to be found at similar or higher elevations further inland. In December, 1909, some scores of acres on its middle and upper western slopes were devastated by fire, and a year later the vegetation was mostly a melancholy array of blackened stumps.

For this reason alone it is very much to be regretted that a great part of its surface has been allowed to pass into private ownership. Its sides are too steep to be of any value for agriculture, and its owners use it merely as an occasional run for sheep and goats. If it had been strictly protected, its capacity for water-

FIG. 32.—NAMAQUALAND.

storage would be greater than it is, and, incidentally, it would have provided a refuge for the wild fauna and flora in a region where these are unusually interesting, and the flora, at least, greatly in need of protection. H. H. W. P.
(To be continued.)

HYBRID FREESIAS.

IN the issues for April 1 and 15 last, I note that attention is drawn to new *Freesias*—one named *Conquest*, raised by Mr. C. Van Tubergen, Haarlem, from inter-crossing *Tubergenii* *Freesias*, and others, raised by Dr. Ragionieri, from crosses of *F. refracta alba* and *F. Leichtlinii*. In 1908 I raised a beautiful variety from a cross between *F. refracta alba* × *F. Armstrongii*, and it received a First-class Certificate from the Horticultural Association of New South Wales. I named it *Freesia Maidenii*, after Mr. Maiden, the Government botanist. Mr. Maiden had a coloured drawing made, the flower being a pleasing shade of lilac-pink. The flowers are the same size as those of *F. refracta alba*, and are sweetly scented. The cross has slightly altered the season of flowering, which is some three weeks in advance of *F. Armstrongii*, and a little later than *F. refracta alba*. I have seedlings from the original plants, and will inform you later of the results. George W. Kershaw, Nurseryman and Rose Grower, Wahroonga, Milson's Point Line, New South Wales.

THE ROSARY.

ROSE BILLARD ET BARRÉ.

ALTHOUGH this variety has been in cultivation for over 20 years, it is still less popular than it ought to be. There is no better golden-yellow garden Rose, for it blooms profusely, and has a good habit of growth.

Billard et Barré bears its flowers on trusses, which are excellently suited for table decoration, and in the bud form it makes a fine coat flower. It can be well grown in three forms, namely, as a large bush, standard, or half standard; as a standard or half standard it makes a fine, strong head.

This variety must not be pruned severely, for this causes very strong growth and but few flowers; all the pruning that is needed is to cut

out dead and worn-out wood, prune fairly hard the weak and twiggy growths, and the strong shoots only as far as they appear unripened. *Billard et Barré* grows and flowers best when grown on the seedling briar stock. Chester Parker.

FRIAR PARK.

AN account of some of the more-striking features in the remarkable gardens of Sir Frank Crisp, at Friar Park, Henley-on-Thames, was published in the *Gardeners' Chronicle*, October 28, 1893, with views of the residence, the lake, rosary, topiary garden, and rockery. A view of the "snow-clad" peak of the Matterhorn surmounting the mountainous rockery, and an illustration of the Japanese garden were given in the issue for October 29, 1909. Many additions have been made to the gardens in late years, and all classes of plants, and more especially those of singular growth or peculiar construction, are represented by important collections, the whole representing one of the finest collections of trees, shrubs and plants, both hardy and exotic, ever seen in a private garden. Although the gardens are comparatively new, everything appears well-established, and this is especially noticeable in the huge rockeries on which, in the high levels masses of Alpine Pinks, Saxifragas, Antennarias, the different species of Thymus, Linnæa borealis, Veronicas, and other Alpines of the higher ranges thrive excellently. On lower levels are

flowers and herbs that were popular in a past age. Bamboos, Gunneras, and other suitable plants are seen on the margins of a great lake. Another pleasant feature of the Friar Park gardens is found in the varied tints in the Pinetum; the blue shade of *Abies Parryana glauca*, *Cedrus atlantica glauca*, and other grey-tinted varieties being especially effective. The Rosary, in which Roses, showy perennials, and annuals are planted, have the main walks arched over, the arches being covered for the most part with the graceful *Wichuraiana* varieties. It was interesting to observe the original *Rosa Lucie* (*Wichuraiana*) of Japan, from which American and European florists have produced the popular climbing varieties now in great favour. The species was planted in a bed by itself, the plants being fully in flower. Lilies of many species are flowering in profusion; *Gladioli*, including some of the newer kinds which are of a violet colour; Cactus and single Dahlias; innumerable showy herbaceous plants, ornamental shrubs, all give a wealth of variety and beauty in their seasons, thriving as they do under the care of the gardener, Mr. P. O. Knowles, who has designed and superintended the whole of the planting.

FIG. 33.—NAMAQUALAND.

Sneeuwkop (5,200 ft.) seen from the pass above Bowesdorp (3,000 ft.). Many fine trees of *Aloe dichotoma* in the centre.

Acaena microphylla, with heads of red flowers, purple *Aubretias*, blue *Plumbago Larpentae*, and Dwarf *Gentians*, *Epigæa repens*, *Schizocodon soldanelloides*, the Heath-like *Fabiana imbricata*, *Coronilla varia*, various species of *Oenothera*, *Geranium*, and a host of other pretty, close-growing rock plants, most of them presenting large masses, and in many cases covering the stones with their brightly-coloured flowers. In basins below the cascades the Cape pond-weed (*Aponogeton distachyon*) bears its white, fragrant flowers, whilst other aquatics, including varieties of coloured *Nymphaeas*, are in flower, the banks being clad with masses of dwarf *Irises*, which show evidence of having flowered well earlier in the season. Specially effective are the yellow sprays of *Tropæolum polyphyllum*, trailing over the higher rocks, and the feathery-white plumes of *Polygonum Baldschuanicum*, drooping over one of the rustic bridges.

A "grey" garden and its surroundings is planted with subjects of a silvery tint, and there are models of old-time gardens planted with the

Through the kindness of Sir Frank Crisp, visitors are permitted to inspect the gardens on Wednesdays from the beginning of May to the end of September, for a small fee, which, together with the proceeds from the sale of a guide-book of the gardens, are divided between the Mayor of Henley's Convalescent Fund, the Gardeners' Royal Benevolent Institution, and the Royal Gardeners' Orphan Fund. The rockeries, with their wonderful caves, through which visitors pass on the stream in a boat, are especially popular, whilst the instructive and amusing illustrated guide-book furnishes much information in a pleasant manner.

THE GLASS HOUSES.

The greater number of the plant-houses contain plants of curious construction, either in their growth or flowers, those which have a medicinal or economic value, and others which are of scriptural or historical interest. Other houses contain plants for decorative purposes. In one house is a fine collection of succulents, including representatives of most of the genera.

In the Orchid houses plants in bloom included *Pleurothallis macroblepharis*, the dwarf, tufted plant bearing many of its gnat-like flowers; *Oncidium abortivum*, with few complete and many rudimentary flowers (see fig. 141, *Gardeners' Chronicle*, November 13, 1909, p. 322); several *Bulbophyllums*, of which the feather-lipped *B. barbigerrum* and the distinct and finely-coloured *B. claptense* were the most noticeable; species of *Cycnoches*, bearing either male or female flowers, and, in one case, flowers of both sexes; *Houlletia Sanderi*, with erect inflorescence of whitish flowers, like those of the Dove plant (*Peristeria elata*); *Angraecum Kotschyi*, with a fine raceme of long-spurred flowers, which elongate by the unfolding of a spiral portion; *A. arcuatum*; *Masdevallia Davisii*, *M. simula*, *M. trichæte*, *M. nidifica* and other *Masdevallias*; *Catasetum Christyanum*, *C. atratum*, *Stenoglottis fimbriata* and *S. longifolia*, *Trichopilia marginata*, *Megaclinium falcatum*, its flattened rachis bearing single rows of curious flowers; *M. purpureorachis*, *Restrepia antennifer*, *Oncidium Papilio*, well-flowered specimens of *Vanda tricolor*, and various *Cypripediums*.

The showier Orchids were represented by *Cattleyas*, *Lælias*, *Lælio-Cattleyas*, *Miltonia vexillaria*, many *Lycastes*, *Odontoglossum crispum*, *O. citrosum*, and a selection of pretty *Thunias*. Other plants less shown but interesting botanically, included *Bulbophyllum Reinwardtii*, *B. saurocephalum*, *B. Sanderianum*; several forms of *B. Lobbii*, and the singular *B. inflatum*, with its curious moss-like flowers, closely arranged on a swollen rachis. Further variety was furnished by plants of *Ornithocephalus grandiflorus*, the handsome rose-lipped *Eulophia guineensis*, and some other pretty *Eulophias*; the carmine *Broughtonia sanguinea*; two fine specimens of *Dendrobium acuminatum*, with several strong spikes of white and rose-coloured flowers; *Scuticaria Hadwenii*; the white *Anguloa uniflora eburnea*; the yellow *A. Clowesii*, and the red and yellow *A. Ruckeri*; *Trichopilia marginata*, *Aërides Fieldingii*, and other species of *Aërides*; *Cirrhopetalum robustum*; *C. Cumingii* and other species; *Calanthe veratrifolia*, *Bletia Shepherdii* and a number of pretty *Epidendrums*.

In another house several species of *Aristolochia* were in flower, including *A. ridicula* and *A. elegans*, also such interesting plants as *Tacca cristata*, the long drooping filaments giving the inflorescence a singular appearance; a selection of insectivorous plants and many *Dorstenias* and *Tillandsias*.

The large aquatic house was gay with tropical Water Lilies in bloom, including the blue *Nymphaea stellata*, *N. Zanzibarensis*, and the rose-coloured *N. devoniensis*, with smaller-growing subjects arranged at the side of the tank. In this house is a very large plant of *Grammatophyllum speciosum*, which has not yet flowered. Suspended from the roof were many plants of *Nepenthes*, furnished with fine pitchers; several trailing Vines and Aroids, a large specimen of *Monstera deliciosa*, with many fruits ripening. I also observed the Rice plant, *Zizania aquatica*, Sugar Cane, *Saccharum officinarum*, and various tropical fruiting and spice-bearing plants. A fernery, arranged as a rockery, contains a fine collection of Ferns, and there is also a Palm house and ranges of fruit houses.

In other plant houses subjects specially noted were a batch of Cape *Eucomis*, with tall spikes, each plant being furnished with a crown of leaves at the apex, a collection of brilliantly-flowered tuberous-rooted *Begonias*, and a fine show of *Lilium speciosum*. *Testudinaria elephantipes* (Elephant's Foot) and *Bowiea volubilis* furnish remarkable examples of dissimilar growth in the lower and upper parts, the bases being of great size and bulb-like in form, the growths being slender and twining. A house has recently been erected for accommodating Alpine and other plants that are not quite hardy in the open rockeries. J. O'B.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP;
AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLE ON PAGE 70.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication, or referring to the literary department, and all plants to be named, should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR AUGUST.

- TUESDAY, AUGUST 1—
Roy. Hort. Soc. Coms. meet. Scottish Hort. Assoc. meet.
- WEDNESDAY, AUGUST 2—
Bishop's Waltham Fl. Sh.
- THURSDAY, AUGUST 3—
Roy. Lancashire Agric. Soc. Sh. at Bury (4 days).
Weston-super-Mare Fl. Sh. Holyport Cottagers' Hort. and Industrial Soc. Sh.
- SATURDAY, AUGUST 5—
Killarney Sweet Pea Show. Soc. Française d'Hort. de Londres meet.
- MONDAY, AUGUST 7—
Bank Holiday. Swanage Fl. Sh.
- TUESDAY, AUGUST 8—
Leicester Fl. Sh. (2 days). Knaresborough and District Fl. Sh. Clevedon Fl. Sh. (2 days).
- WEDNESDAY, AUGUST 9—
Brecon Fl. Sh.
- THURSDAY, AUGUST 10—
Taunton Deane Fl. Sh. Soc. Nationale d'Hort. de France (Paris) Exh. Prendergast Fl. Sh. at Haverfordwest. Border Sweet Pea Soc. Sh. at Coldstream.
- SATURDAY, AUGUST 12—
Green and District Fl. Sh.
- MONDAY, AUGUST 14—
United Hort. Benefit and Prov. Soc. Com. meet.
- TUESDAY, AUGUST 15—
Roy. Hort. Soc. Coms. meet (no exhibition). Roy. Oxfordshire Fl. Sh. American Gladiolus Soc. Sh. at Baltimore, U.S.A. (4 days).
- WEDNESDAY, AUGUST 16—
Hemel Hempstead Fl. Sh.
- THURSDAY, AUGUST 17—
Roy. Hort. Soc. of Aberdeen Sh. in Duthie Park, Aberdeen (3 days). Deal, Walmer & Dist. Fl. Sh.
- TUESDAY, AUGUST 22—
Roy. Hort. Soc. of Ireland Fl. Sh.
- WEDNESDAY, AUGUST 23—
Shropshire Hort. Soc. Sh. at Shrewsbury (2 days).
- THURSDAY, AUGUST 24—

PROVINCES.—Wednesday, July 26: Max 73° Cambridge; Min. 57° Ireland N.W.

The Fruit Crops.

In the present issue we publish our customary report on the outdoor fruit crops, and we do so with some satisfaction, because the report shows that, as compared with last season, the present prospects are distinctly favourable. This much may be said, although it is only too probable that the drought which still prevails may have serious effects in gardens and plantations where the soil is lacking in moisture-holding qualities.

Taking Apples first, we find that, out of 264 returns, there are only 37 which describe the crop as being less than the average, whilst 139 reporters have average crops and 88 have crops which exceed the average. On glancing at the figures for 1910, it will be seen that these were far less favourable, for the total of 226 returns was composed of 180 below the average and only 46 which were equal to, or above, the average. In 1909 the returns were better than last year, but less good than those of the present season. Thus, the Apple crop is of a gratifying nature, and it is to be hoped that rain will be forthcoming before the drought causes a serious thinning of the fruits. In some cases within our observation the trees are already relieving themselves of part of the crop, but in these particular instances there are, fortunately, more than sufficient fruits left to ripen. It is interesting to note that the returns from England, Wales, Scotland, and Ireland show almost the same proportion of average crops, which is somewhat unusual.

The Pear crop is less satisfactory than that of Apples, and scarcely, if anything, better than last year, while it is much less favourable than the crop of 1909. Out of 257 returns, as many as 192 describe the crops as under the average; there are 60 average crops and only five which are estimated as exceeding the average. Next week we hope to print some of the remarks of our correspondents on the circumstances which they believe to have operated for and against the crops. In respect to Pears, it should be remembered that, if the sunless character of the season 1909 was the cause of the failure last year, the paucity of the present crops may also be largely due to the unfavourable weather which prevailed last summer, for it was certainly as bad as in the previous year. But it is very difficult to apportion the blame with any approach to certainty, and every fruit-grower knows well enough that the weather conditions in the spring of the present year, when Pear trees should have been setting their fruits, was exceptionally unpropitious. The failure of the Pear crop appears to be general, for the returns, as in Apples, show much the same proportion of under-average crops in the various districts. Plums promise to be much more plentiful than last year, when there were 165 reports of under-average crops out of 221 returns. This year there are only 128 crops under the average out of 259 returns. The average crops last year were 50, whilst this season they are 102, and instead of six over-average crops last year there are now 29. Cherries afford another instance

of a satisfactory yield, as compared with last year, the returns being nearly equal to those of 1909. Out of 244 reports, there are 122 which describe the crop as equal to the average, 34 which state over-average crops, and 88 cases in which the yield is deficient. For this crop the returns from the English counties, particularly Kent, are the more valuable, and the figures for this county are 78 average crops, 23 above the average, and 59 less than the average yield.

Peaches, Nectarines and Apricots were all badly affected by unfavourable weather in spring, whilst the trees were in flower, and, in addition, the trees can scarcely have matured as well as usual last season. Out of 179 returns for Peaches and Nectarines, there are 111 cases in which the crops fail to equal the average, and only nine reporters in the whole kingdom are in the satisfactory position of having yields which exceed the average. There are 165 reports upon Apricots, and 122 of these state that the crop is inferior to the average. In the London district Peaches, Nectarines and Apricots are less satisfactory than they have been for several years past, and the reason generally advanced by those directly concerned in the cultivation of the trees is the cold spell which occurred in April.

Under the heading "Small Fruits" are grouped red and white Currants, Gooseberries, Blackberries, Raspberries and Loganberries, and our returns year after year show clearly enough that these fruits crop with a greater certainty than Apples, Pears, Plums and Peaches. This year, out of 264 returns, there are 134 reports of average crops, 117 in which the yield is described as exceeding the average, and only 13 cases in which the average is not reached. This result is more favourable than last year, but scarcely equal to the returns for 1909, when there were only seven reports of under-average crops in the kingdom. Strawberries were not so plentiful this year as last season, but the yield, particularly from the later ripening varieties, was equal to that of 1909. Respecting Nuts, including both Filberts and Walnuts, the returns show that in 96 cases the crops are equal to the average, whilst 40 are deficient.

OUR SUPPLEMENTARY ILLUSTRATION shows two fine specimens of uncommon Ferns growing in Brisbane Botanic Gardens. The plant of *Platynerium grande* has the two types of fronds found in these Ferns exceptionally well developed, the barren ones forming large, erect, fan-shaped laminae, while the fertile fronds are more or less lax and pendulous, of stag-horn or elk-horn-like outline, and with the spores distributed in a dense, even layer over the dorsal surface near the tips. The size of the specimen may be judged from the well-grown *Caladium* foliage below it. The other Fern is a magnificent example of *Ophioglossum pendulum* (Ribbon Fern) growing from a plant of *Platynerium alcinorne*. In this case it is the contrast between the length and abundance of the fronds of this species of Adder's Tongue Fern and those of our little native species, *O. vulgatum*, which excites the admiration of the home botanist. In

fig. 34 is illustrated a fine specimen of *Polypodium irioides* var. *ramosum*, found wild by Mr. MACKAY, in North Queensland, and introduced some years ago by Mr. W. BULL, of Chelsea, under the name of "lobatum," which was altered to "ramosum." Some of the sporophylls from this plant, such as the one now illustrated in fig. 34, shown even more beautiful fronds than the parent. In fig. 35 is represented a very curious species of *Polypodium*, *P. rigidulum* var. *Vidgenii*, which is dimorphic, bearing two distinct types of fronds, the larger ones somewhat resembling those of *P. vulgare*, and the short, dense, stalkless ones those of the Oak-leaf Fern. In a communication to Mr. DRURY, to whom we are indebted for the photographs, Mr. BAILEY refers to a beautiful variety of this species found by his nephew having fronds much more acutely and finely cut. A form similar to this and perhaps identical with it was included in Messrs. H. B. MAY & SONS' exhibit at the Olympia Show. It resembled *P. Knightiae*, but the fronds had a more lucent surface, and were not so much divided.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, August 1. The lecture by Mr. R. IRWIN LYNCH has been postponed to a later meeting.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION.—From the list of successes in the examination in horticulture held on April 5, we notice that 202 candidates entered for the Society's general examination and 68 in the junior division. Of the senior candidates, 33, or 16 per cent., secured places in the first class; 95, or 48 per cent., in the second class; while 69, or 35 per cent., appear in the third class. Only one candidate failed altogether. Of the 68 juniors, four were placed in the first, 18 in the second, 25 in the third, and 19 in the fourth class. G. M. GROVER, Studley College, Warwickshire, heads the list of seniors in Class I., whilst H. C. ELSDEN, Technical School, Chelmsford, occupies the corresponding place in the junior division.

KING GEORGE'S GIFT TO THE VICEREGAL GARDENER.—Prior to the departure of the Court from Dublin Castle, His Majesty sent for Mr. WATT, head gardener at the Viceregal Lodge, under whose supervision the floral decorations at the Castle were carried out, and presented him with a diamond pin, bearing the King's monogram, surmounted by a crown.

SIR JOSEPH HOOKER, who entered upon his 95th year on June 30 last, has a paper on the Balsaminaceæ of the State of Chitral in the *Kew Bulletin* for June, 1911. He enumerates eight species, mostly collected by officers of the Army. Among the contributors named are: General GATACRE, Colonel Sir FRANCIS YOUNG-HUSBAND, Surgeon Lieut.-Colonel HAMILTON, Major WALL, and Lieuts. TOPPIN and STIRLING. In the past much has been done for horticulture and botany by the military, and it is pleasing to know that there are good followers. We know of none more enthusiastic than the late Colonel COLLETT, whose *Flora of Simla* was a great success.

HIGH PRICE FOR GROWING PEAS.—We are informed that at a sale conducted recently by Mr. G. H. BANKS, auctioneer, of Kidderminster, a six-acre field of culinary Pea Senator fetched £44 per acre; and a 19-acre field of the same variety £25 per acre. Both crops were grown in the Stourport district. Senator was raised and introduced into commerce by Messrs. WEBB & SONS, of Wordsley. It was awarded a First-class Certificate by the Royal Horticultural Society on July 11, 1902, after trial in the R.H.S. gardens at Chiswick.

WHAT PIG-WEED TAKES FROM THE SOIL.—Under this somewhat striking title, the *Queensland Agricultural Journal*, quoting *Garden and Field*, points out the largeness of the quantity of plant-food taken from the soil by weeds. Chemical analysis shows that a ton of pig-weed, air-dried, contains five times as much potash, twice as much nitrogen, and just as much phosphorus as a ton of manure.

THE ORCHARDS OF CANADA.—Nothing can escape enumeration in these days, and among the latest objects to be subjected to the calculating eye of the census official are the fruit trees of Canada. According to the last official census, an article on which is contributed by Mr. H. MARTINET to *Le Jardin*, the Apple trees of Canada number upwards of 15 million, Peaches nearly 1½ million, Pears fewer than a million, Plums about 2½ million, and Cherries 1¼ million; altogether, the fruit trees number some 21 million, excluding vines, of which there are nearly 3 million. This was in 1901, since which time the totals have been increased enormously, the growers of British Columbia alone having planted some 4½ million trees. It is estimated that there are now upwards of 30 million fruit trees in the Dominion, and that the

FIG. 34.—*POLYPODIUM IRIOIDES* VAR. *RAMOSUM*.
(See "Our Supplementary Illustration," p. 70.)

capital value which the orchards of Canada represent is about 125 million pounds sterling: this on the basis of the allowance of £5 per tree.

DRYING FRUIT FOR MARKET.—The industry of drying fruit for commercial purposes is the subject of an interesting article by Mr. G. ERIC in *L'Agriculture Nouvelle*. This fruit-drying industry has reached a considerable magnitude both in California and also in the Austrian Tyrol. In the latter region it has developed very rapidly, thanks to the methods of co-operation which have been adopted, methods which concern themselves not only with the development of markets but also with the introduction of the best and most uniform processes of gathering, grading, preserving, and packing the fruit. The chief centres of the industry in the Tyrol are Bozen, Meran, and Wintschgan, near Innsbruck. The art of drying fruit successfully consists in the reduction of the amount of water contained therein to such a point that the fruits do not decay, and no further. Dried to this extent, the fruit remains soft and keeps its flavour; dried more, it loses both in quality and weight. Ripe fruits dry better and quicker than immature fruits, and the larger the fruit the better are the results achieved by drying. Fruits dried in their skins—Plums, Cherries, and Grapes—should be exposed first to

a relatively low temperature, which should be raised as the drying proceeds. Pears and Apples, on the other hand, are submitted at once to a fairly high temperature. They are bleached immediately after having been peeled. This is done best by exposing them to the vapour of sulphurous oxide. The time of drying varies with the nature of the fruit and with its state—whether whole or in pieces—and may be as brief as three or as long as eight hours. The cost of drying is extremely small.

KENT COMMERCIAL FRUIT SHOW.—A fruit show and conference will be held in conjunction with the Fat Cattle Show at Ashford on Monday and Tuesday, December 11 and 12. Lord NORTHBOURNE has been appointed president of the fruit show and conference, and Mr. M. J. R. DUNSTAN, principal of the South-Eastern Agricultural College, Wye, chairman of committee. A committee has been elected by the various agricultural and horticultural associations of the county. The schedule embraces classes for Apples packed in boxes, maiden fruit trees and bottled fruits. The boxes to be used for the Apples must be of one of the two sizes adopted by the National Fruit Growers' Federation. The majority of the classes are open only to Kentish growers, but some are open to all. The exhibits are to be judged from a strictly commercial standpoint as to quality, size, and shape for general utility, and also as to the method of packing, so as to display the fruit in the most attractive form and to ensure safe carriage. The authorities of Wye College have arranged a fruit conference and packing demonstration on the first day of the show. Exhibits from traders are invited. The hon. secretary is Mr. W. B. BURGESS, South-Eastern Agricultural College, Wye.

ROSE CANKER AND A NEW APPLE CANCER.—In the issue for May 13, p. 293, reference was made to the prevalence in this country of Canker in Roses, caused by the fungus, *Coniothyrium Fuckelii*. In the June number of *Phytopathology*, an American periodical devoted to the study of plant diseases, Mr. P. O'GARA records the presence of this disease in the United States and shows also that the same fungus is responsible for a canker of Apple twigs in that country. The spore bodies and spores formed in the cankers of the Apple are identical with those present in the Rose canker, and cross inoculations have clearly established the identity of the two diseases. This canker of the Apple affects the twigs and the stems of nursery stock just above the crown; the same fungus causes a rot of the fruit, circular, discoloured, and somewhat sunken areas being formed at the points of infection. Mr. O'GARA mentions a case in which serious affection of young Apple trees occurred in the immediate vicinity of a clump of wild Roses that were badly attacked by the same disease. Rose canker being frequently found in England, it will be interesting to know whether the fungus causing it is also capable of producing in this country a canker of the Apple such as occurs in the United States.

"THE WILD FLOWERS OF BARMOUTH AND THE NEIGHBOURHOOD."—We have received the fourth edition of a booklet bearing the foregoing title, and published by JAMES KYNOCH, of Brighton. The contents follow no sort of order. First comes a list, arranged systematically, under the Natural Orders, with popular names added, but no localities. This is followed by a list of additions since 1887. Then a list of certain plants, &c., by the late Rev. T. SALWEY, with habitats, and including cryptogams of all classes, except Fungi. It was first published in 1863. Apart from repetitions in separate lists, misprints are numerous.

MIDLAND AGRICULTURAL AND DAIRY COLLEGE.—The annual meeting of the College will be held on Monday, the 31st inst., at 3.15 p.m., when the report on the year's work will be presented.

ROCKERY AT DERWENT HILL GARDENS.—A large rockery has just been completed at Derwent Hill, Keswick, the residence of Mr. ROBERT SLACK. The work of construction has occupied 18 months, and, in order to mark its completion, Mr. SLACK entertained the operators at dinner. The new rock-garden was designed and constructed by Mr. T. R. HAYES, nurseryman, Keswick.

ACCLIMATISATION EXPERIMENTS.—*Bulletin* No. 207 of the U.S. Department of Agriculture contains lists of seeds and plants imported into the United States from January to March, 1910, the purpose of the importations being mainly to secure hardy, or otherwise serviceable, plants for acclimatisation or breeding purposes. The list, which is a testimony to the activity of American plant-collectors, contains, among specially noteworthy importations, the following:—Seeds of fruit trees from Kashmir, namely, *Prunus cerasus*, *Amygdalus persica*, *Prunus armeniaca*, *Pyrus communis*, *Malus sylvestris*, drought-resistant Pears (*Pyrus* spp.) from China, where they are cultivated among the hills of S.W. Manchuria as far north as 43-44°; the fruits are hard, late, and keep all the winter. Tubers of Potatoes (*Solanum* spp.) from Chili, wild Clovers from the mountains of Turkey, and dark-purple seedless Grapes from Wisley. In addition to the plants already named, there is a new form of *Malus baccata* from Siberia, which is in use in Russia (St. Petersburg), for hybridising with *M. prunifolia*, in order to obtain a hardier race of Apples.

NOTICES OF BOOKS.

RHODODENDRONS.*

ONE of the later volumes in the Present-Day Gardening Series is Mr. Watson's book on *Rhododendrons and Azaleas*, which contains an interesting preface by Sir Frederick Moore, M.A. This volume is not only very nicely illustrated, but it is a correct record of what has been done with Rhododendrons in gardens. No one is better situated to write a book on this subject than the Curator of Kew, for these gardens possess a large collection of both species and hybrids. Horticulturists may think that nature has placed no finality on the ability and ingenuity of man to improve plant life by hybridisation and good culture, therefore, while Mr. Watson very pleasantly and correctly tells us what men like Waterer, Veitch, Mangles, and others have done, his book should incite us to still further efforts.

Breeders should aim at a prolongation of the flowering season of Rhododendrons by the hybridisation of the early-flowering Himalayan species, which flower in March and April. The chief difficulty with which we have here to deal is the liability of the blooms to be cut off by frost. But there is this to be said, the undeveloped buds are not injured by slight frosts, and the leaf growth is usually so much later as to escape injury altogether, so that the mischief is almost entirely limited to the trusses of bloom which have actually expanded. Not only so, but it is little short of marvellous to witness how short a time is required by the Rhododendron to come up again, as it were, to the scratch with a fresh set of trusses which have been waiting for a thaw. I do not wish to be tied down to any sort of definition of that much abused word "hardy," it is a term capable of such interpretations and vagaries as make me cordially dislike it. It is so comparative and so open to misinterpretation that it ought never to be ap-

plied without qualification. I have known the Oak, Ash, Bracken Fern, and common Bramble, injured by frost if caught when the sap is up, yet they are amongst the commonest of our so-called hardy native plants. My experience of some Himalayan Rhododendrons is that they are every bit as hardy as the Oak.

It would be interesting if Mr. Watson would tell us more about *R. Wightii*. Some 30 years ago Sir George King, of Calcutta, sent me seeds of it, which in due time gave results of the most disappointing kind. When the plant bloomed with me it had a washy pink or white, small campanulate truss of the size and shape of *R. campylocarpum*, with the characteristic black honey spots in the base of the corolla, but nothing else peculiar in bloom or in foliage. Complaints of the same disappointment reached me from Ireland, Cornwall, Surrey, and other counties. It was evident that my plant was not the *R. Wightii* of Sir Joseph Hooker's *Rhododendrons of the Sikkim Himalayas*, and I am not aware that the true *R. Wightii* has yet been

named *R. Harrisii* by Mr. Watson, and I saw it in splendid condition in April this year in Mr. Graham Vivian's garden at Clyne. It is a really fine thing, of the deepest blood-red colour. About 30 years ago the late Mr. J. H. Mangles and his brother were at Penllergaer, and we amused ourselves by crossing some Rhododendrons, such as *R. Thomsonii*, *R. Fortunei*, *R. Aucklandii* (*Griffithianum*), and *R. ochraceum*, now, I believe, known as *arboreum album*.

I had some of my plants of the hardy sorts from Van Houtte, and among them was one of which I am very fond. It was then catalogued as *R. Massangei*, but was afterwards called *R. campanulatum Fleur du Roi*.

On another important point Mr. Watson's observations, will be very welcome. Whence comes the colour of the golden-coloured Azalea Anthony Koster? It is all very well to say *A. sinensis* and *A. mollis* are synonymous. I have any quantity of *mollis*, and I have crossed it with *pontica* and other species, whereas the plants of *A. sinensis* sent me by Van Houtte

FIG. 35.—POLYPODIUM RIGIDULUM VAR. VIDGENII IN BRISBANE BOTANIC GARDENS.
(See also Supplementary Illustration.)

grown in an English garden. The late J. H. Mangles was staying with me in South Wales some 30 years ago, and he told me he had heard of a plant of it at Vienna. He went to try and secure it, but all in vain, as it was not *R. Wightii*.

Sir Joseph Hooker's figure of this species is not exaggerated, and we may still hope to have some day the true species in our gardens. Possibly it will be found to be a native of a lower elevation in the Himalayas than we had supposed, and in consequence it may not be as hardy as we have been led to expect. Sir Joseph Hooker has told me that *R. arboreum*, the common Rhododendron of India, from Ceylon through the Neilgherries, Simla, Burma, the Himalaya, &c., is represented by white, pink, and red forms, but at lower elevations than we can expect hardness. My pink and white arboreums have been very successful, but it is only now that I am beginning to enjoy the beautiful scarlet arboreums which I have long coveted.

Many years ago that very able and expert gardener, Mr. James Harris, when gardener to the late Lord Swansea, raised a seedling between a red *R. arboreum* and *R. barbatum*, which was

died, not once nor twice, until I placed them under glass, and then I obtained pollen with which I crossed *A. mollis*. From this cross I have got a golden Azalea, a little better than *A. mollis*, but not quite so good as Anthony Koster. The question I wish to ask Mr. Watson is does not a finer form come from a warmer part of China than the ordinary type of *A. mollis*? My experience as related may have been unhappy, but it appears to support the contention of some that two quite distinct plants have been named *mollis* and *sinensis* respectively.

The history of the Rhododendron in gardens is an interesting one. Mr. Watson has given us a great deal of it in his book, but I think much remains to be told, particularly with respect to the magnificent race of hardy plants that we know as Waterer's Rhododendrons. There are, however, other matters beside the breeding of these plants to be dealt with in a small popular book on so large and varied a genus of garden plants, and I doubt if the whole of them could have been more admirably treated upon than in the charming volume under notice. John T. D. Llewelyn, Penllergaer, Swansea.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SELF-POLLINATING APPLES.—If all readers of this paper who have evidence as to the self-fertile qualities of certain varieties of Apples and the non self-pollinative capability of others would give it in these columns, growers of fruit would be placed in possession of valuable information. Fruit-tree nurserymen and growers on a large scale can hardly fail to have such evidence in their plantations, for they usually grow a single variety in a large block. On p. 2 I gave evidence to show that Royal Jubilee is self-pollinative; that Lord Grosvenor is self-pollinative or at the least safe to set fruit if as far as 216 feet from any other variety that blossoms at about the same time; and that Cox's Orange Pippin, declared to be not self-fertile, can safely be planted in blocks of eight rows 12 feet apart. But I can "go one better" than this in reference to Cox's Orange Pippin, as I have a block of 12 rows now in the third year from the planting, and there are no Apples beyond one side of the block. Yet the trees on the outside, 144 feet from any other variety, set

NARCISSUS FLY.—May I point out to your recent correspondents on the Narcissus fly (*Meron equestris*) that this is a notifiable pest under the Destructive Insects and Pests Order of 1910, and that if they fail to report the presence of the pest in their bulbs, they are contravening an Order of the Board of Agriculture, which renders themselves liable to a fine of £10? G. C. G.

FORCING VINES.—I am extremely obliged to those writers who have taken up this matter so keenly on both sides. Writers of the weekly *Calendar*s never ought to be thin-skinned, as it is very easy for anyone so inclined to criticise the directions given. There are so many ways of dealing with the various subjects in horticulture that it is quite possible to obtain good results by entirely different methods of treatment. My remarks have been based entirely on practical experience. Mr. Jefferies is of opinion that 99 per cent. of present-day gardeners syringe their vines at starting time, simply because they were taught to do so in their early days. This does not say much for the intelligence of the head gardener; I have a far better opinion of him than that. If we moved no faster than this, surely as a profession we should be a long way behind in most matters pertaining to our

in a locality where Charlock is a pest on far too many farms." They no doubt fight shy of this annual spraying for the reasons I have already stated. It is 50 years since I first ploughed, harrowed, and reaped with the sickle. I wrote from practical experience. W. P. R., *Fron Haul, Holywell.*

THE "READY BARTLE" POOR CHILDREN'S FUND.—I appeal to members of the various horticultural societies to assist me in my efforts on behalf of the poor and fatherless children of outer London. The objects of this fund are to provide a convalescent home at the seaside for those who have been ill and a holiday home in the country among the wild flowers; to provide also boots for the barefooted and Christmas-tree parties for the slum children. Contributions, however small, may be sent to the undersigned or to my colleague, C. H. Bartle, 29, Turney Road, Dulwich, S.E. R. Ready, *F.R.H.S., 18, Ross Road, Wallington.*

PLAGIANTHUS LYALLII.—The excellent drawing of this plant in last week's issue, although giving a perfect idea of the flower, through being sketched in an upright position and from the under side, does not afford quite a correct picture of how the flowers appear on the plant. The flowers, although produced from the axils of the leaves, appear on the shrub as though growing from the under side of the branches, and in this way many of them are hidden by the foliage. The best way, therefore, to plant this shrub is to have it on an eminence, so that it may be viewed from below. Thus looking up into the shrub, so many more of its beautiful flowers are brought into view. There appear to be at least two forms in cultivation, one having greener and more glabrous leaves. Although the plant may be considered quite hardy, a sunny position should be given it, so as to get a thorough ripening of the growth. It does equally well as a bush, short standard, or as a wall plant, and it is worthy of extended cultivation. T. H. C.

MELONS AT BALLYFIN.

THE Melons shown in fig. 36 were growing in one of the old pine-stoves at Ballyfin, Queen's County, the residence of Sir Algernon Coote, Bart. The varieties were Hero of Lockinge and Triumph, and the fruits were in various stages of ripening. Mr. Thornton, who kindly sent the photograph, informs us that the largest fruit weighed nearly 7 lbs. Other fruits, including Grapes, are also cultivated exceptionally well at Ballyfin. The vine-borders were re-made by the gardener, Mr. McLaren, some 14 years ago, since which time the vines have produced excellent crops.

SCOTLAND.

QUEEN MARY AND THE SCOTTISH HORTICULTURAL ASSOCIATION.

ON the occasion of the recent visit of their Majesties the King and Queen to Edinburgh, Queen Mary was graciously pleased to accept a basket of Roses offered by the president and council of the Scottish Horticultural Association. Her Majesty commanded that a letter of thanks be sent to the president and council of the Association, and the letter forwarded to the secretary, Mr. A. D. Richardson, was as follows:—"July 20, 1911. Dear Sir,—I have handed to the Queen the beautiful basket of Scotch-grown Roses which the president and you brought to the Palace this morning. Her Majesty is greatly pleased with the flowers, and commands me to write at once and ask you to be good enough to convey to the president and council of the Scottish Horticultural Association her deep sense of appreciation of, and grateful thanks for, their kind and charming gift. E. W. Wallington."

The Roses were grown in Messrs. Dicksons' Nurseries, Craigmillar.

FIG. 36.—A CROP OF MELONS AT BALLYFIN HOUSE.

as many Apples as I allowed them to bear—only a few near the trunks—as trees close to Mr. Gladstone on the other side. If this does not prove that Cox's Orange Pippin is self-pollinative, it proves at least that the injunction to plant only two rows of one variety in one place may be safely disregarded. Other varieties which do not show any lack of fruiting through being planted in blocks 60 feet wide (five rows) are Lane's Prince Albert, Domino, Early Julyan, Duchess of Oldenberg, and Stirling Castle. Among Plums I have eight rows each of Rivers's Early Prolific, Victoria, Pond's Seedling, and six of Monarch and Czar, the trees in which have fruited as well in the middles of their respective blocks as on the outsides. A *Southern Grower*.

SALVIA SCLAREA (see page 27).—I first noticed this beautiful plant several years ago in a cottage garden at a small village named Dulcote, just outside the city of Wells in Somersetshire. It is a biennial species and seeds rather freely. W. J. Wise, *Sellwood Mills, Frome, Somerset.* [An illustration of this species, flowering in a bed at the Cambridge Botanic Gardens, was printed in *Gard. Chron.*, October 10, 1908, p. 268.—Eds.]

calling. It is quite true that many of the big forest trees, including Beeches, die from the top, downwards. This, of course, is owing to the fact that there is not sufficient vitality to force up the sap to the extreme top, but the conditions are different both in a young tree and a vine. E. Beckett.

THE DESTRUCTION OF CHARLOCK.—I was pleased to be informed by Mr. Molyneux (see p. 26) that he can get the upper hand of this weed by spraying once or twice in the season. By carrying out my suggestions there would be no need for this annual labour and expense, and by sowing any of the green crops named its destruction would be a source of profit, and the roots left would be of some manurial value in the soil. When I wrote of bare fallowing I had in my mind the worthless grain crops of recent years, and I thought, and think so still, that it would be more economical to miss a crop and get rid of the weed. Mr. Molyneux is surely aware that farm crops are sown in spring, and that fallowing is an excellent preparation for grain and root crops. It appears that Mr. Molyneux's apparent success has not inspired his neighbours to follow his example, for he tells us that "he lives

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

CYPRIPEDIUM.—Though the members of this genus requiring a warm treatment are not so extensively cultivated as the cooler-growing species nevertheless the late spring and early summer-flowering *Cypripediums* include very attractive plants. The species *C. Stonei*, *C. Rothschildianum*, *C. Sanderianum*, *C. Curtisii*, *C. superbians*, also the hybrids *C. Sanderiano-Curtisii*, *C. Mrs. Reginald Young*, *C. Sanderiano-superbians*, *C. Massianum*, *C. callosi-Rothschildianum*, *C. Transvaal*, *C. A. de Lairese*, *C. Shillianum*, and *C. l'Ansonii* all require stove heat and a liberal treatment generally. But *C. Lawrenceanum* and its variety *Hyeanum*, *C. barbatum*, *C. callosum* and its variety *Sanderæ*, with the host of hybrids derived from these, grow better in an intermediate temperature. Many of these Orchids are propagated easily, and may be divided again and again provided care be taken in the operation. The present is the most suitable time to undertake a general overhauling of the plants, and with a view to the providing of new rooting material to specimens that need it. Crocks, arranged perfectly, should occupy about two-thirds of the depth of the pots or pans, as efficient drainage is essential. Employ a porous compost, consisting of fibrous peat one-half, turfy loam one-quarter, and *Sphagnum-moss* one-quarter, with a liberal addition of coarse silver sand. Water may be given directly after the repotting; in fact, it is required in almost as copious supplies at that stage as at the season of active growth, owing to the new compost drying quickly. The plants should occupy a position where they can be shaded from strong sunshine, and there must be no lack of moisture at the root or in the atmosphere. Light sprayings overhead with soft, tepid water when the weather is favourable are very beneficial, especially to those kinds that have tessellated foliage. Insects seldom attack *Cypripediums* when the plants are thriving in plenty of atmospheric moisture, although they soon become troublesome in the case of weakly, half-starved plants having shrivelled leaves and growing in dry, draughty houses.

SUCCULENT CYPRIPEDIUMS.—The little group of this section composed of *C. bellatulum*, *C. Godefroyæ*, *C. leucochilum*, *C. concolor*, *C. niveum*, &c., are the most difficult to cultivate and retain in a healthy condition. In winter, more especially in the neighbourhood of large cities, where fogs are prevalent, they show a disposition to decay in the centre of the growths, and at the base of the leaves. The greatest care must, therefore, be exercised in affording water, which should not be allowed to remain in the growing points, and, whilst a certain amount of root moisture is always required, the plants must be kept somewhat drier in winter than most *Cypripediums*. The plants succeed best when grown close up to the roof-glass, where they are free from drip, and a warm, moist atmosphere is necessary to their well-being. During their growing season the supply of water at the roots should be ample, but watering overhead is not to be recommended, nor should water be allowed to collect about the bases of the plants. This danger is obviated by elevating the plants a little in the pots, keeping the centre of the compost higher than the sides: in the case of newly-imported plants this is always a wise practice. The most suitable time for repotting is soon after the plants have passed out of flowering, but disturbance at the roots should not take place unless the condition of the compost and drainage make this necessary. If the surface material be sour, pick out as much as possible without injury to the roots, and replace it with a compost similar to that advised above, adding some finely-broken brick, crock, or nodules of limestone. Some very fine hybrids have been raised in this section, some of which grow and flower freely, whilst others are most difficult to cultivate and retain in a satisfactory condition.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

HEDGES.—The present is a good time to clip evergreen hedges. They will not make much fresh growth before winter, therefore they will present a trimmed appearance until next spring; thus it is possible to do with but the one clipping in the year. Specimen trees of Yew or of Conifers, whether of pyramidal or other shape, may also be trimmed at the present time. The shears should have thin blades with very sharp edges in order to ensure clean cuts. The trimming of hedges and trees can be carried out most conveniently in dull weather and when the verdure is slightly moist. Any of the commoner shrubs may be examined, and if any pruning is needed this operation can be carried out with the knife or one of the handy pruning instruments available for the purpose. If shrubs are pruned neatly and regularly with care, they will scarcely show that they have been trimmed at all, but this effect cannot be secured unless the pruning is carried out by experienced workmen.

PHLOX.—Plants of herbaceous Phlox have begun to flower much earlier than usual, and in gardens that do not contain the latest flowering sorts the blooming season will be likely to be a short one. The earliest variety to bloom is *Eclairer*, followed by *Soleil*, and then by *Le Mahdi* and others. There are so many beautiful Phloxes that the number is bewildering, and it is difficult to make a selection from the flowers exhibited at the shows. For instance, assuming that *Soleil* and *Sheriff Ivory* and *Le Mahdi* and *Iris* were staged in juxtaposition, *Soleil* and *Le Mahdi* would almost certainly be passed over, and the others chosen, and so with *Eugène Danzanvilliers* and *Jean Best*, but though these varieties resemble each other in some characteristics, there are differences in the time of flowering sufficient to make it worth while to cultivate most or all of them. Some varieties, though they appear fine at exhibitions, do not associate happily with other flowers, and other varieties, again, have so poor a habit of growth, for instance, *Coquilicot*, that they are seldom cultivated with ease or satisfaction. Phloxes soon feel the effect of drought, and unless their roots are watered thoroughly from time to time, the flowers are certain to fall.

ANEMONE JAPONICA.—Varieties of the Japanese *Anemone* have likewise commenced to bloom early. There are far too many varieties of this fine plant, especially those with so-called double flowers. One of the best is the old *Honorine Jobert*, which has small white flowers, and *Whirlwind*, also white and excellent for late blooming. Of the pink forms the finest I have had is "*Profusion*," which is much like the better-known *Queen Charlotte*, but more floriferous, and, altogether, a better border plant. The double flowers as a rule are disappointing, the colours of the more recent varieties being far from attractive.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

ERANTHEMUM PULCHELLUM.—Of all blue-flowering plants blooming during the winter season, this is one of the best, grown either as medium bushes or as quite dwarf specimens. If a stock be raised now from cuttings, dwarf stocky plants will be obtained that may, after one shift, be flowered in 4½-inch pots. Small flowering plants of *Eranthemums* are extremely useful in the winter for floral decorations.

CROSSANDRA UNDULÆFOLIA.—This plant is of the same Order (*Acanthaceæ*) as *Aphelandra*. Seedlings raised in the spring are making good specimens. The plants will flower this autumn and again early next season, when seed may be obtained for another sowing.

FERNS FOR CUTTING.—Where there is any special demand for fronds of such kinds as *Adiantum cuneatum*, the plants should now be encouraged to make a hard, enduring growth. Where room is scarce in the glasshouses a cold frame will answer their requirements well at this season. The greenhouse will suit them better now than a stove or other moist, humid house.

Shade is not, as a rule, necessary, and should not be employed except in excessively hot weather. Any plants of this Fern from which the fronds have been cut freely should receive a partial rest for a time. After the lapse of a few weeks it will be possible, by a variation in the treatment, to secure a fresh growth. Plants in relatively small pots with an abundance of roots will be found better for cutting purposes than larger examples. In larger pots the fronds may be finer, but they are not so enduring after they are cut. The fronds should be immersed in a tank of water for a time before using them for decorations.

WINTER-FLOWERING BEGONIAS.—Give every possible attention to Begonias of the *Gloire de Lorraine* type. There is still time to root cuttings for procuring a batch of plants to flower in 3-inch pots. Those now established in receptacles of that size should be potted into 4½-inch pots, and those already in 4½-inch pots into others a size larger, which are the largest pots needed for plants rooted this season. Old plants, however, may be grown as specimens in 8½-inch pots, but larger pots than these are not needed unless in exceptional cases. Use a light soil, and pot firmly. This Begonia makes an excellent basket-plant, and it is a suitable time to plant in baskets those intended for flowering next winter, bearing in mind that a medium-sized basket not overcrowded is far better than a larger receptacle containing several plants. A rusty appearance of the under-surfaces of the leaves is an indication of the presence of a member of the spider family (*Arachnidæ*), more minute than the red spider. Dipping the foliage in a weak solution of Tobacco juice and rinsing afterwards in clear water will destroy this pest. Begonias of the winter-flowering, tuberous-rooted section should be given every encouragement at this stage, but fire-heat must not be employed whilst hot weather continues. In most respects their culture should be the same as advised for *B. Gloire de Lorraine*. Begonias of the "*semperflorens*" type should soon receive their final shift, and afterwards the stronger shoots should be pinched to induce a bushy growth. These Begonias will succeed in an ordinary greenhouse, or a cool pit, but they must be shaded from excessive sunlight. Begonias like *B. nitida* and *B. odorata* that are often planted out and trained to trellises should have the old, hardened wood removed and the younger shoots trained in its place.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

LATE VINERIES.—Now that the berries are swelling freely, every encouragement should be given the vines to produce large bunches and fine berries. Much can be done in this respect by careful attention to ventilation and damping. In the afternoon, when closing the house, the surfaces of the border and paths should be freely damped, occasionally employing manure water in place of clear water, which will tend to keep the foliage free from the attack of red spider; should this pest be troublesome, the affected leaves must be sponged. Later in the day the top ventilators of the house should be again opened, allowing them to remain open all night; this is preferable at this season to opening them early in the morning, as it decreases the danger of the leaves scalding. If the vines are in a healthy condition and carrying fair crops of fruit, and the borders are not waterlogged, a stimulant may be applied once a fortnight, varying the kind from time to time and washing it well into the soil. Regulate and stop the laterals before these become too hard. If they are removed early it will do much towards providing a better circulation of air near the roof of the house. Where vines have their roots also in outside borders these latter must be watered with the same care as indoor borders. Though in many places it is considered bad practice to cultivate a crop on outdoor vine borders a dwarf growth such as annuals does much towards conserving the moisture in the ground, and certainly improves the appearance of the borders; failing the annuals, a light mulch is necessary.

PLUMS IN POTS.—Trees carrying crops of ripening Plums will need less water than

formerly, and only clear water must be used. As the fruit is taken from them the trees should be removed out-of-doors, and the pots partly plunged. Continue to keep the foliage in a healthy condition by thorough syringings and stop the growths as necessary, pinching those which are not required for extension in order that they may form fruiting buds for next season. Do not neglect the watering of the roots; any trees that have carried good crops may be given occasional applications of manure. With careful attention, Plums may be allowed to hang upon the trees for some time after they become ripe, and their flavour will improve.

PEARS IN POTS.—Many of these will now be swelling their fruits freely, and it will help them if stimulants are afforded the roots. Pear trees are gross feeders, and while growing require plenty of water; the space for supplying water may be increased by placing a ring of turfy loam above the top of the pot. Support the fruits firmly, especially those varieties that are expected to attain a good size. Continue to syringe the trees freely with soft water. If a warm position can be chosen for them, the trees can be removed out-of-doors, as recommended for Apples, when the colouring of the fruits will be encouraged. Plunge the pots up to the rims, as besides minimising the labour attached to watering and making the plants thoroughly secure against wind, the roots will thus be kept cooler.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

MUSHROOMS.—Preparation should be made now for the autumn supply of Mushrooms. Let the house be thoroughly cleansed and the walls washed with hot lime; a little sulphur may also be burned in the house to destroy any insect pests which the brush may fail to reach. Manure should be collected daily and placed in a dry, open shed, where it may be turned frequently preparatory to making the bed, which may be done about the middle of August; but no great quantity of manure should be placed together, or it will become sour and unfit for use. Mushrooms may be expected from this bed about the middle of October. Mushroom-beds in cool sheds should be examined carefully, and a gentle watering afforded if the surface is at all dry. Remove the layer of straw covering the bed before applying the water, and replace it the following morning, to keep the winds from unduly drying the surface.

ASPARAGUS.—Seedling plants of Asparagus should be regulated in the rows, thinning them to a few inches apart. When of sufficient size, they should be afforded support by stretching a wire, to which the young plants may be tied, along each row. The same remark applies to all Asparagus in exposed positions: it is an easy matter to place a wire along each row and to tie the plants before they are injured by wind. If dry weather continues, the beds should be given a dressing of salt, and watered freely with clear water. Keep the soil free from weeds by a frequent use of the Dutch hoe, which, if used carefully, will do no harm at this season.

POTATOS.—The early Potatos should be lifted as soon as the haulm has withered, and the ground will be available for some winter crop. Directly the tubers are dry, they should be stored away in some dark place, as strong light soon spoils their best cooking qualities. If seed tubers are required for next season's planting, the tubers selected for the purpose should be exposed to the light for a short time to harden their skins, before they are placed in the store-room, which should be freely ventilated until the advent of frost.

TURNIPS.—A sowing of Turnips for furnishing a winter supply should be made without delay. Ground recently occupied by early Peas will be suitable: it will only require breaking up 2 or 3 inches deep with the point of a digging fork, and afterwards raked as finely as possible with a wooden rake. Sow the seeds in drills drawn at 15 inches apart. When the seedlings are well above the ground they should be thinned to 9 inches apart, and frequent dressings of fine wood-ashes applied. The Turnip is a moisture-loving plant, and in dry weather copious

applications of water are needed to encourage a quick growth. A sowing of Turnips may be made weekly during the next three weeks, the last to furnish roots for remaining in the ground throughout the winter. Red Globe, Green Top Stone, Golden Ball, and Chirk Castle may be sown to come into use in the order named.

MINT.—Plants of Mint which have become overgrown should be cut close to the ground and a thorough soaking of water applied afterwards to encourage the development of new shoots. By this method a supply of young, green Mint should be available until the plants are cut down by frost, when roots placed in a gentle heat about the middle of October will be furnished with suitable shoots.

BASIL.—Seeds of this herb should be sown in heat about the middle of August to produce a supply of green leaves throughout the winter months. A temperature of 65° is necessary to grow this tender herb successfully.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

WATERING FRUIT TREES.—The watering of fruit tree borders is a matter requiring much discretion. Sometimes, even when the drainage is good, the soil will become overcharged with moisture, whilst, on the other hand, the evil effects resulting from drought are almost or quite as great as from excessive wet. Especially in the case of Peaches, Nectarines, and Apricots must these extremes be carefully guarded against, for, where the border is allowed to become too dry, the buds will begin to fall the following spring upon the first flow of the sap, and this will ruin the crop for the season. Again, a deficiency of water at any time soon brings the fruit to the ground, even in its more advanced state previous to ripening, and, moreover, dry conditions favour the spread of red spider. The opposite conditions—a cold, wet soil—will certainly cause mildew to appear. When water is necessary, it must be applied copiously; merely wetting the surface is worse than useless, for when once the top layer of soil only is wetted, it cannot be determined what quantity of water has been afforded. Water should never be withheld until the trees show signs of distress, for by that time the evil is done. The advantages resulting from a proper and timely attention to these matters will soon be apparent in a general, healthful condition of the trees. The quantity of water to be applied at any one time, whether to trees growing in prepared borders or the natural soil, is such as will sink down to the lower roots of the trees. The amount will, of course, depend on circumstances. If the soil is stiff and cold, or has a cold, wet sub-soil, less water is needed than where the ground is of a lighter, drier character. The periods of watering must be regulated according to the season. If the weather has been wet previous to the opening of the blossom in the spring, no water need be given until there are indications of the soil becoming dry, upon which a thorough and complete soaking should be given. On no account should the soil be allowed to become dry at the flowering stage, or the greater part of the bloom will drop. Trees growing on a south aspect require more water than those in other positions; but the amount must be regulated according to the season and the condition of the soil. Many growers do not water stone fruits, particularly Peaches, Nectarines, and Apricots, during the stoning period, but do so as soon as that stage is passed. In that case care must be taken to ensure the borders being in a moist condition before stoning commences. Applications of manure water promote a healthy growth in fruit trees, and this form of stimulant is preferable to ordinary manure. Espalier trees in the open garden do not require such close attention in watering and feeding as wall trees, because their roots extend on every side, the rain and dew fall more directly upon them, they derive more benefit from the free circulation of air, and the soil about them does not dry so quickly as that of wall borders, where absorption and evaporation of moisture is very great, owing to the absorptive powers of the masonry of the walls, and the reflected heat from the latter.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 18.—*Present*: Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Sir J. T. D. Llewelyn, Dr. A. B. Rendle, Dr. A. Voelcker, Messrs. J. T. Bennett-Poë, J. Fraser, W. Fawcett, E. M. Holmes, G. Wilson, R. H. Pearson, A. W. Sutton, A. W. Hill, and F. J. Chittenden (hon. sec.).

Botanical Certificates.—*Catasetum reflexum*, a new species, from Peru, approaching *Cynoches* in some of its characters, was sent from Glasnevin by Sir FRED. MOORE. On the motion of Mr. O'BRIEN, seconded by Mr. WILSON, a Botanical Certificate was unanimously recommended to this plant. A new *Dendrobium*, from Java, was exhibited by Sir TREVOR LAWRENCE, Bart. It had been described under the name of *D. Annae*, J. J. Smith, and is nearly allied to *D. mutabile*, which was shown to compare with it, but about double the size. On the motion of Mr. O'BRIEN, seconded by Mr. BENNETT-POË, a Botanical Certificate was recommended.

Scale on grass.—Mr. E. M. HOLMES showed a white scale insect attacking grass from Charing. This scale (*Uriopeltis festucae*) appears to be common this season in places, and proves destructive to the grasses it attacks, causing them to become brown.

Sweet Pea roots.—Mr. E. M. HOLMES also showed dying roots of Sweet Pea. These, as is so frequently the case this year, were attacked by the fungus *Thielavia basicola*. The foliage of attacked plants turns yellow in patches, and finally dies, while the stem is often streaked with yellowish-brown. The fungus also attacks the culinary Pea, and produces similar symptoms. In America and Italy it has proved extremely destructive to Tobacco, and nothing short of sterilisation of the soil has proved an effective check to its ravages.

Papaver orientale with cleistogamous flowers.—Mr. J. FRASER showed *Papaver orientale* with cleistogamous flowers. The plants had produced similar flowers last year. The petals were linear oblong, not imbricate, and only as long as the sepals. The pollen was abundant, and both stamens and pistil appeared normal.

Sport in Shirley Poppy.—Mr. FRASER also showed flowers of Shirley Poppy having the usual yellow stamens, but with two of the petals red and the two alternate ones white.

Matricaria suaveolens.—Mr. BOWLES showed specimens of *Matricaria suaveolens* (= *M. discoidea*), an introduced plant which now grows wild in many English counties, and as far north as Aberdeen. The specimens were collected in the neighbourhood of Epping.

Crown-gall.—Mr. H. T. GÜSSOW (Canada) sent specimens of crown-gall—large swellings on the roots or near the collar of trees. It has been shown by Dr. ERWIN SMITH to be due to the attack of *Bacillus tumefaciens*, though others, apparently without recourse to inoculation experiments, have ascribed it to the attack of a myxomycete. Numerous plants of widely distinct families are attacked by the bacillus but it does not yet seem to be clearly established that it is very harmful to the tree attacked.

Fasciated Rose.—Mr. BASHAM, of Bassaleg, sent a fasciated Rose stem over 1 inch in diameter, and bearing at its apex about nine more or less developed buds.

HORTICULTURAL CLUB.

VISIT TO FRIAR PARK.

JULY 21.—The annual outing of the Horticultural Club took place on the above date, when a party of about 75 members and friends, including a number of ladies, visited Friar Park, at the invitation of Sir Frank Crisp, vice-president of the Club. The party travelled in saloon carriages from Paddington to Reading, where a steam launch provided by Sir Frank Crisp was found waiting at Caversham Lock to convey the visitors to Henley. At Henley they were met by Sir Frank and Lady Crisp, and luncheon was taken in Sir Frank's boathouse.

the room and tables being prettily decorated with pink Roses.

After luncheon Sir Frank Crisp conducted the party over the Friar Park Gardens, including the magnificent rockery, planted with such a wonderful collection of Alpine species and presenting Alpine views of great breadth and height, culminating in a distant view of the Matterhorn. In the Rose garden the display of pink Ramblers was extraordinarily good, and amongst other fine features was the collection of clipped trees, many of them exhibiting a rich golden colour. The visitors were then conducted through the underground caves and caverns with their population of gnomes, bats and owls, into the recesses of the ice cave beneath the glaciers of the Matterhorn, and then along the subterranean streams. The new Japanese garden was also inspected, and the conservatories containing many interesting botanical plants. The beautiful dwelling-house itself, with its riddles and puzzles deftly wrought into its sculptured walls also evoked both admiration and amusement.

Following the inspection of the gardens the visitors were conveyed back to the boathouse, where they re-embarked in the launch for a further trip to Marlow. After partaking of tea at the Castle Hotel, Marlow, a move was made to the railway station, where saloon carriages were again waiting to convey the party to Paddington. To mark the occasion of the visit, a rhymed and humorous description of Friar Park had been written by Mr. C. T. Druery and printed by Sir Frank Crisp for distribution.

The outing was a most enjoyable one, and the feelings of the visitors were well voiced by Mr. Harry Veitch, immediately after luncheon, when he proposed a vote of thanks to Sir Frank and Lady Crisp.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 6.—Committee present: Rev. J. Crombleholme (Chairman), R. Ashworth, H. Thorp, P. Weathers, D. McLeod, W. Holmes, Z. A. Ward, C. Parker, and H. Arthur (secretary).

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), exhibited a small collection of Miltonias. The variety of *M. vexillaria* named Magpie received an Award of Merit.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalglish), exhibited a distinct pale form of *Cattleya Mossiae* var. *Bleuana*.

Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), exhibited a fine form of *Odontocda* × *Charlesworthii*, which has been previously certificated, and *Odontoglossum* × *Rossiana*.

Mr. J. STOTT, Radcliffe, was awarded a First-class Certificate for a good variety of *Stanhopea trigina*.

Messrs. SANDER & SONS, St. Albans, staged a small group of plants, principally *Cattleya* and *Laelio-Cattleya* hybrids of good quality.

Mr. J. BIRCHENALL, Alderley Edge, exhibited a fine form of *Cattleya Mendelii* with a richly-coloured lip, also a few interesting botanical specimens. P. W.

WESTERN ROSE.

JULY 22.—The annual exhibition of this Scottish Rose society was held at Gourrock on this date. The show attracted some of the best Rose growers in Great Britain.

In the eight open classes Mr. HUGH DICKSON, Belfast, won five, Messrs. ALEX. DICKSON & SONS, Newtownards, two, and Mr. D. ROBERTSON & Co., Helensburgh, one 1st prize. Messrs. THOMAS SMITH & SON, Stranraer, won seven 3rd prizes in this division.

Mrs. RUSSELL, Rosegarth, Newton Mearns, won the Challenge Cup offered for 18 blooms in the amateurs' classes, and this exhibitor also showed the best three vases of Roses, of distinct varieties, and a vase of Roses.

The "Dr. J. Campbell Hall" Challenge Cup offered for 12 blooms, distinct, was won by Mr. J. E. TURNER, Ardmay, Gourrock, who also excelled in the classes for 12 blooms in not fewer than eight varieties, and for six blooms of Hybrid Tea Roses.

Mr. PETER KENYON, South Bar, Troon, showed best in the classes for 12 blooms of Hybrid Tea varieties, and four distinct varieties, three blooms of each sort.

NORTH LONSDALE ROSE.

JULY 19.—The 28th exhibition of the above society was held on this date in conjunction with the National Rose Society, this being the third occasion the premier society has associated itself with the North Lonsdale show. The exhibition was held in Swarthdale Park, Ulverston, in delightful weather. Some excellent Roses were forthcoming, whilst Sweet Peas were shown splendidly.

In the nurserymen's classes for Roses, a challenge cup and gold medal were offered for the best exhibit of 36 blooms, distinct. Messrs. A. DICKSON & SONS, Newtownards, were the successful exhibitors, their choicest blooms including specimens of Marie Baumann, Horace Vernet, Lyon Rose, Juliet, Ulrich Brunner, Earl of Warwick, Mrs. Miles Kennedy and Ulster; 2nd, KING'S ACRE NURSERY Co., Hereford.

In the class for 72 varieties, distinct, Messrs. ALEX. DICKSON & SONS again won the 1st prize, showing, amongst others, Jewel, Bertha Gaulis, Annie Wood, Bridesmaid, and Fisher Holmes; 2nd, Mr. HUGH DICKSON, Belfast.

Mr. G. PRINCE, Oxford, led in the class for 36 blooms, distinct, Mr. H. DREW, Longworth, and Mr. W. FERGUSON, Dunfermline, being 2nd and 3rd respectively.

In the class for six triplets, the winners were in this order: Mr. G. PRINCE and Mr. W. FERGUSON.

Mr. PRINCE also excelled in the class for 12 Tea or Noisette varieties, distinct; whilst for 12 distinct varieties, shown in five blooms of each sort, Mr. W. FERGUSON won the 1st prize and Messrs. A. DICKSON & SONS, the 2nd prize.

The best basket of Roses of seven exhibits was shown by Mr. J. MATTOCK, Oxford, who showed Lyon Rose beautifully.

A gold medal was awarded to George Dickson, a variety of rich crimson colour, shown by Messrs. A. DICKSON & SONS.

AMATEURS' CLASSES.

The principal class in this section was for 24 blooms, distinct, a challenge cup and gold medal being offered for the premier exhibit. Mr. W. J. CALVERT, Helen's Bay, was placed 1st with a charming collection that included fine blooms of Mildred Grant (awarded the silver medal offered for best H.T. variety), Frau Karl Druschki, Queen of Spain, Wm. Shean, and Mrs. Miles Kennedy. Mr. D. T. PALLET, Earl's Colne, Essex, followed closely, whilst Mr. W. BOYES, Middleton-on-Wolds, was placed 3rd.

The best exhibit of 36 varieties, distinct, was shown by the Rev. J. H. PEMBERTON, Havering-atte-Bower, his bloom of Charles Lefebvre being especially fine in colour. The 2nd and 3rd prizes were awarded to Mr. H. V. MACHIN and Mr. CONWAY JONES respectively.

Dr. PALLET secured the chief award in the class for eight distinct varieties, three blooms of each variety.

In the class for nine blooms of any Rose except a Tea or Noisette variety, Mr. H. V. MACHIN won the 1st prize with Frau Karl Druschki.

Mr. E. SPEIGHT, Market Harborough, was placed 1st for 18 varieties, distinct, his collection including the best H.P. variety in Horace Vernet. This exhibitor also excelled in the classes for six varieties, three blooms of each, and for six blooms of any Rose except a Tea or Noisette variety with richly-coloured blooms of Lyon Rose.

For 12 distinct varieties, Mr. W. HOFFMAN, Yorks., was placed 1st, whilst for nine varieties, Mr. T. B. RUSSELL, Manchester, led, Mr. E. GODFREY, Penrith, occupying a similar position for six distinct varieties.

The 1st prize in the class for six blooms of any Rose except a Tea or Noisette variety was won by Mr. M. WHITTLE with finely-coloured blooms of Lyon Rose.

Mr. CONWAY JONES led in the class for 12 distinct varieties of Tea or Noisette Roses, followed by Mr. W. BOYES. The best exhibit of nine varieties was shown by Dr. T. V. PALLET; the best of six varieties by Mr. W. UPTON; the best of six varieties, three blooms of each, by Mr. CONWAY JONES; the best of 12 varieties of decorative Roses by the Rev. J. H. PEMBERTON.

In the local section, the gold cup offered for 12 blooms, distinct, was won by Mr. R. L. GARNETT; whilst the Ulverston Council Cup was won by Miss G. WHALLEY.

SWEET PEAS.

The classes in this section were well filled, and in many cases the quality of the flowers was superb.

Mr. R. BOLTON, Carnforth, secured the challenge trophy offered for 24 bunches, distinct, with a fine collection, the variety Stirling Stent being especially good; 2nd, Mr. W. WRIGHT, Formby. Mr. J. BRYCE was placed 1st for six varieties, and Mr. E. M. ALLEN, Formby, for six new varieties.

Mr. R. BOLTON had the best vase of novelties not in commerce.

In the many classes where special prizes were offered, Mr. E. M. ALLEN, Mr. J. BRYCE, Mr. F. HARRISON, and Mr. T. PROCTOR won 1st prizes. Mr. C. V. TAYLOR secured the J. Towers Settle Challenge Cup, Mr. J. BLISS the Coronation Medal, and Mrs. F. HARRISON the District Council Challenge Bowl.

The North-Western Daily Mail offered prizes for one bunch of sweet Peas to consist of not more than 15 spikes in not more than three varieties. The bunches numbered 86, the 1st prize, which included a gold medal, was awarded to Mrs. ATKINSON, Croftlands, Ulverston.

LIVERPOOL HORTICULTURAL.

JULY 19.—The third Rose and Sweet Pea show of this society was held in the Corn Market, and proved the best of the three, the entries being more numerous than last year.

But the society has never been successful in selecting a date when Roses are at their best condition, and on this occasion there was a poor competition. F. R. DIXON-NUTTALL, Esq. (gr. J. Barker), was the most successful exhibitor of Roses, winning the 1st prizes in the classes for 18 and 12 varieties, his best blooms being the Lyon Rose, J. B. Clark and Mrs. W. J. Grant.

Mr. G. A. TURNER had the best exhibit of six distinct varieties.

Carnations and Picotees were a pretty feature of the show, those staged by Messrs. R. A. BROWN being very effective. This firm won the 1st prizes for six blooms, distinct, and for 12 blooms. Mr. G. A. TURNER also won a 1st prize in these classes.

In the classes for 20 distinct vases of Sweet Peas and two classes for 12 varieties of Sweet Peas Col. CORNWALLIS WEST (gr. Mr. Forder) had the premier collections, his best varieties being Maud Holmes, Marjorie Miller and Wells Spencer.

Miss NEWSHAM had the most tastefully-arranged table of Sweet Peas.

Mr. T. HENSHAW and Mr. A. F. SLOANE were placed 1st for 12 bunches and six bunches respectively of hardy herbaceous flowers.

In the amateur classes the 1st prize-winners were Mr. H. S. HODGKINSON and Mr. L. THOMSON (for Roses), Mr. W. BINDLOSS, Mr. G. FAULKNER, and Mr. F. HINDLEY (for Sweet Peas), Mr. L. THOMSON and Mr. W. A. CRIPPER (for hardy flowers and Begonias), Mr. G. A. TURNER (for Carnations), and Mr. J. R. J. TURNER (for Pansies and Violas).

NON-COMPETITIVE EXHIBITS.

A gold medal was awarded THE LIVERPOOL ORCHID & NURSERY Co. for a table of Orchids.

Silver Medals were awarded to Messrs. DICKSONS, Chester, for herbaceous flowers; Mr. W. ROWLAND, for Roses and Sweet Peas; Messrs. R. P. KER & SONS, for stove and greenhouse plants, fruit and vegetables; Messrs. BAKERS, Wolverhampton, for Roses; Messrs. BEES LTD., Liverpool, for Roses and hardy herbaceous flowers; Mr. PATTISON, Shrewsbury, for Violas; Messrs. W. CONWAY & SONS, Halifax, for hardy border flowers; Mr. ROBERT MANSON GATEACRE, for Roses; and Mr. HENRY MIDDLEHURST, for Sweet Peas.

ANCIENT SOCIETY YORK FLORISTS.

JULY 19.—The annual outing of the members and friends of the above society took place on this date, when a visit was made to Belvoir Castle, Grantham. A very enjoyable day was spent. It is suggested that next year's outing be to the Royal International Show at Chelsea in May.

DURHAM, NORTHUMBERLAND, AND NEWCASTLE-ON-TYNE.

JULY 19, 20, 21.—The annual show of the above society was held in the Recreation Ground, North Road, Newcastle-on-Tyne, on these dates in beautiful weather. This old and respected society appears to have allowed an innovation at this show, for members of the Press were excluded until after the judges had completed their work. This caused the reporters considerable difficulties, and we feel sure that the committee will see to it that the Press is treated with greater courtesy on future occasions.

In the class for a group of miscellaneous plants arranged to occupy a space 25 feet by 12 feet, A. E. BAINBRIDGE, Esq., Lynwood Jesmond, Newcastle, was placed 1st, for a most gracefully-arranged collection of foliage and flowering plants, the particular features in the group being finely-coloured Codiaums, retaining their foliage to the base. The flowering plants in the centre consisted of finely-flowered specimens of Thunia Marshalliana, hybrid Cattleyas, and Odontoglossums in variety. 2nd, Mr. W. A. HOLMES, West End Nursery, Chesterfield, Derby. This group consisted principally of finely-grown Codiaums, but the effect was much heavier in appearance than the 1st prize exhibit, and too few flowering plants were employed. 3rd, Mr. H. H. HILLIER, Green Park Gardens, Darlington. This group was very well arranged, Roses and Bougainvilleas being a special attraction.

The class for six plants in bloom, distinct varieties, was, as usual, contested by the local pitmen, whose plants were splendidly shown. Mr. J. ELLISON, Shankhouse Terrace, Cramlington, was placed 1st for grand specimens of Clerodendron Balfouri, Allamanda Hendersonii, Stephanotis floribunda, Dipladenia amabilis, Clerodendron fallax, and a very large specimen of Hydrangea hortensis. Messrs. ARTHUR & HARRISON, West Wylam, Prudhoe, followed closely. In the centre of this exhibitor's group was a large specimen of Oncidium flexuosum with upwards of 30 spikes of flower, with grand plants of Statice profusa and Bougainvillea Sanderiana, Clerodendron Balfouri and C. fallax.

For six table plants, A. E. BAINBRIDGE, Esq. (gr. Mr. Bell) was awarded the 1st prize, and Mr. H. H. HILLIER the 2nd prize.

In the cut flower classes, the best 12 bunches of Sweet Peas were shown by The Rt. Hon. Sir GEORGE TREVELYAN, Bart., Wallington Hall Gardens, Cambo, Northumberland (gr. Mr. E. Keith), the collection being one of the finest ever shown in the North of England. All the spikes, with the exception of Thomas Stevenson, had four flowers each. The following varieties were also included: Hugh Dickson, Etta Dyke, Marjory Linzee, Isobel Malcolm, J. Ingman, Dobbie's Edrom Beauty, Elsie Herbert, Sunproof Crimson, Mrs. C. Breadmore, Masterpiece, and Tom Bolton. 2nd, Earl GREY, Howick House, Lebury. The variety Marjory Willis was shown particularly well by this exhibitor. 3rd, Mr. F. BELL, Nurseryman, Whitley Bay.

Mr. E. KEITH was 1st in both Messrs. Sutton & Sons' and Messrs. E. Webb & Son's classes.

ROSES.

In the class for 36 Roses in 18 distinct varieties, Messrs. HARKNESS & Co., Hitchin, were awarded the 1st prize. The best flowers in this exhibit were Hugh Dickson, White Maman Cochet, Mrs. J. Laing, and Lyon. 2nd, Mr. ARTHUR H. RIGG, Nurseryman, Shipley Glen, Baildon.

Messrs. HARKNESS & Co. also excelled in the class for 24 blooms in 12 distinct varieties; 2nd, Mr. A. H. RIGG; 3rd, Messrs. G. GIBSON & Co., Leeming Bar, Bedale.

For 12 Roses to include eight distinct varieties, Messrs. HARKNESS & Co. were again successful.

In the class for 18 bunches of hardy herbaceous flowers was seen the finest display of bloom in the show. The 1st prize was won by Messrs. GIBSON & Co., Bedale; 2nd, Messrs. HARKNESS & Co.; 3rd, Messrs. LONGSTER & SONS, Malton, Yorkshire.

The prizes offered for a collection of Carnations were awarded as follow: 1st, J. BRENNAND, Esq.; 2nd, Mr. W. LAWRENSON, Egglecliffe; 3rd, the Earl of DURHAM (gr. Mr. W. Smith).

FRUIT AND VEGETABLES.

The fruit classes were, on the whole, well contested. J. BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. E. Hathaway), was placed 1st for eight dishes of fruit. He showed fine bunches of Muscat of Alexandria and Madresfield Court Grapes, Royal George Peaches, Universal Melon, Early Rivers Nectarine, grandly-coloured fruits of Lady Sudeley Apple, Brown Turkey Figs, and The Czar Plums. 2nd, J. DRAKES, Esq., Oxford House, Market Rasen (gr. Mr. Parker). The Grapes in this exhibit were very fine, but the other fruit in some cases appeared to be over-ripe. 3rd, The Rt. Hon. Lady BEAUMONT (gr. Mr. W. Nicholls).

In the class for four dishes of fruit Mr. BRENNAND was placed 1st; Mr. J. DRAKES, 2nd; and Lady BEAUMONT, 3rd.

The best four bunches of Grapes in not fewer than two varieties were shown by Mr. BRENNAND, the varieties being Cannon Hall Muscat, Lady Hutt, Madresfield Court, and Black Hamburg. 2nd, Mr. DRAKES, who showed four fine bunches of Madresfield Court, Black Hamburg, Muscat of Alexandria, and Buckland Sweetwater. 3rd, Lady COWELL, Clifton Castle, Yorkshire (gr. Mr. J. R. Gardiner).

In the class for two bunches of Muscat of Alexandria Grapes, Mrs. H. F. SWAN, Prudhoe Hall, Prudhoe, Newcastle-on-Tyne (gr. Mr. G. Shotton), won the 1st prize; J. KNOTT, Esq., Close House, Wylam-on-Tyne, being placed 2nd.

Mr. BRENNAND had the best two bunches of white Grapes any other variety in large bunches of Lady Hutt; 2nd, JAMES KNOTT, Esq., with Foster's Seedling.

Mr. DRAKE was placed 1st in the class for two bunches of Black Hamburg; Lady COWELL being 2nd; and The Rt. Hon. Lord GREY, Howick, Lebury (gr. Mr. W. Lambert), 3rd.

For two bunches of black Grapes any other variety, Lady COWELL was 1st with Madresfield Court; 2nd, Mr. DRAKES.

In the vegetable section the prizes were given by Messrs. Sutton & Sons and Messrs. Ed. Webb & Sons, Lady BEAUMONT winning the 1st prize in each case.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. KENT & BRYDON for a miscellaneous group of herbaceous plants, pot Roses, greenhouse plants, ornamental Acers, and other hardy foliage plants; Messrs. JOHN FORBES, LTD., Howick, for a grand display of Pentstemons, Phloxes, Delphiniums, Violas, &c. To Messrs. ED. WEBB & SONS, Stourbridge, for a very imposing exhibit of Sweet Peas, Lilliums, Gladioli, herbaceous plants, fruit and vegetables. To Messrs. DICKSON, Chester, for Roses, herbaceous plants and annuals. To Messrs. CLIBRANS, Manchester, for Roses, which constituted one of the most attractive features in the show. To Messrs. SUTTON & SONS, Reading, for a grand display of fruit, flowers, vegetables and salads. To Mr. W. LAWRENSON, Yarm, for Roses, Carnations, and other flowers; and Messrs. BLAKE BROS., LTD., for Alpha Spraying Apparatus.

Silver Medals were awarded to Messrs. IRVINE & SONS, Jedburgh, for Delphiniums, Phloxes and Pentstemons.

EASTBOURNE SWEET PEA.

JULY 19-20.—A most successful exhibition of Sweet Peas was held in the delightful Floral Hall, Devonshire Park, on these dates. Notwithstanding the great heat, the hall was cool, and the majority of the flowers appeared fresh even on the second evening.

A silver bowl was offered in the first class for the best display of Sweet Peas, and this was won by Mrs. KENSINGTON, Upfield (gr. Mr. F. Beale). The blooms were large, fresh and well coloured, the best varieties being Earl Spencer, America Spencer, Flora Spencer, Florence Nightingale, Paradise Ivory, Mrs. A. Ireland, King Edward Spencer, Marjorie Willis, Mrs. C. W. Breadmore, and Mrs. H. Sykes. 2nd, C. A. MORRIS FIELD, Esq., Tunbridge Wells (gr. Mr. J. R. Allan). 3rd C DIPLOCK, Esq., Polegate (gr. Mr. G. Whitehorn).

The class for 12 bunches of Sweet Peas brought a magnificent array of blossoms. The 1st prize

was awarded to Mr. W. H. SMITH, Hailsham. This gentleman won many other prizes, his flowers in every instance being of superb quality. The varieties he showed in this class, in which a silver cup was offered, were Isabel Malcolm, John Ingman, Arthur Unwin, President, Masterpiece, Othello Spencer, Mrs. Hugh Dickson, Edna Unwin, Nora Unwin (extra fine), Mrs. C. W. Breadmore, Hercules, and Sunproof Crimson (grand). 2nd, Mr. H. COSHAM, Eastbourne. 3rd Mr. W. WELLS.

Mr. JAMES BOX, of Lindfield, Haywards Heath, won the 1st prize offered for the best display in the class open to trade exhibitors. Decorated tables numbered 23.

NON-COMPETITIVE EXHIBITS.—These added greatly to the success of the show. Messrs. SUTTON & SONS staged a large and effective arrangement of flowers, fruits and vegetables, large pyramids of their new Clarkias being especially noticeable. The exhibit was awarded a Gold Medal and a silver bowl offered for the best honorary exhibit in the show. Another important honorary exhibit was shown by Mr. C. F. WALTERS, Balcombe, Sussex, who had a magnificent arrangement of Carnations, for which also a Gold Medal was awarded. Messrs. G. & A. CLARK, Ltd., Dover, were awarded a Silver Medal for a large collection of hardy herbaceous plants and a picturesque rock garden, which occupied a large space in the centre of the hall. Mr. JAS. BOX, Lindfield, Sussex, also had a fine exhibit of hardy and perennial flowers, his Phloxes being particularly good. A Silver-gilt Medal was awarded to this exhibit. Messrs. YOUNG & Co., of Cheltenham, staged Carnations, for which a Silver-gilt medal was awarded. Mr. T. DURANT YOUNG, Rose-grower, Eastbourne, displayed choice Roses, for which a Silver Medal was awarded. Messrs. H. G. WHITE & Co., received a Silver Medal for a collection of fruit. Mr. C. W. BREADMORE, Winchester, also gained a Silver Medal for a collection of Sweet Peas. Good non-competitive exhibits were also staged by Mr. WM. KNIGHT, Hailsham Nurseries; Mr. C. T. SCOTT, Upton Nurseries; Mr. CECIL CHANDLESS, Berwick; and Messrs. WELLS & Co., Merstham.

NATIONAL VEGETABLE.

JULY 19.—We publish the society's official report on early Peas sent for trial to the Times Experimental Station, Sutton Green, Surrey. The Peas were inspected by the committee on the above date.

The total number of stocks sent for trial was 50, supplied by 22 seedsmen. The sowings took place on March 19, in rows 20 feet in length, all being admirably grown and staked. For purposes of comparison the varieties were divided into dwarf and tall growers; the former ranging from 15 inches to 24 inches in height; the latter ranging from 2½ feet to 4 feet in height. Of the dwarf section three marks or "Highly Commended" were awarded to Daffodil, from Messrs. JAMES CARTER & Co.; The Laxton, from Messrs. LAXTON BROS.; English Wonder, from Messrs. DOBBIE & Co.; Peter Pan, from Messrs. WATKINS & SIMPSON; and Little Marvel, from Messrs. WEBB & SONS and Messrs. BARR & SONS. Of taller varieties Pilot, 3 feet in height, received three marks or "Highly Commended," from Messrs. DICKSON, BROWN & TAIT, WEBB & SONS, ALEX. DICKSON, HURST & SONS and YATES of Evesham. Three marks were also awarded to Gradus, 3½ feet, from Messrs. DOBBIE & Co., DICKSON, BROWN & TAIT, WATKINS & SIMPSON, ALEX. DICKSON & ROBERT SYDENHAM LIMITED. Three marks were also awarded to Ready Reckoner of the Pilot type, from Mr. W. G. HOLMES, Tain, N.B.; Early Primo, from Messrs. DICKSON & ROBINSON and Messrs. WATKINS & SIMPSON; Talisman, from Messrs. SHARPE & Co. of Sleaford; First and Best, from Messrs. DICKSON & ROBINSON; Ideal, from Messrs. SUTTON & SONS; Glory of Devon and Western Express, from Messrs. ROBERT VEITCH & SONS. Two marks were awarded to Giant Lightning, from Messrs. BARR & SONS; Vanguard, from Messrs. SHARPE & Co.; and Snowdrop, from Messrs. JAMES CARTER & Co.

Many varieties sent bore round seeds in small pods, and these were found to be greatly deficient in cropping qualities and in flavour.

NATIONAL CARNATION & PICOTEE. (SOUTHERN SECTION.)

JULY 25.—The annual show of the National Carnation and Picotee Society was held on Tuesday last in the Royal Horticultural Hall, Westminster. Owing to the drought there was a considerable falling off in the number of entries, and many were withdrawn at the last moment. The keenest competition centred round the classes for the smaller growers. The classes for 18 "dressed" blooms only brought two competitors but those for 12 blooms had six and those for six blooms eight competitors.

An important change in the schedule was made this year by substituting the terms "flowers shown on cards" and "flowers shown as grown," for the old-fashioned and well-recognised terms, "dressed" and "undressed,"

DOUGLAS winning the 2nd prize, but in the classes for Fancies, White-ground Picotees and Yellow-ground Picotees, the positions were reversed, Mr. DOUGLAS winning the 1st prize in each case.

The varieties shown in the premier collections were as follow:—

Bizarres and Flakes.—Briar Lea, Bo-peep, C. H. Herbert, Ethel Macrae, E. Adams, Guardsman, Gordon Lewis, Geo. Melville, Jo. Jester (2), J. S. Hedderley, Meteor, Miss T. Lord, Robt. Houlgrave (2), Shamrock (2), and Wilfred.

Fancies.—Alice B. Stewart, Erl King, Forester, Hidalgo, Ironside (2), King Solomon, Liberté, Linkman, Lord Steyne, Mrs. Gardiner, Mrs. Penton, Orient, Pasquin, Sam Weller, and Seedling.

Picotees were:—1st, Mr. H. R. TAYLOR, Cheam; 2nd, Mr. C. F. THURSTON, Wolverhampton; and 3rd, Mr. H. MATHIAS, Medstead; and for Yellow-ground Picotees:—1st, Mr. H. MATHIAS, Medstead; 2nd, Mr. C. F. THURSTON, Wolverhampton; and 3rd, Mr. W. H. PARTON, Moseley. In the corresponding classes for six blooms, Mr. J. J. SHELDON, South Woodford, was placed first for Bizarres and Flakes. Mr. F. W. GOODFELLOW, Walsall, was 1st for Fancies and Yellow-ground Picotees, and Mr. G. D. FORD, Acock's Green, for White-ground Picotees.

BLOOMS SHOWN IN VASES.

The association of three or more flowers of one variety in a vase, with the addition of Carnation foliage and buds, made these classes very attractive. In the four classes for six vases of six varieties of Sells, Fancies, White-ground Fancies, and Picotees respectively, Mr. J. DOUGLAS, Edenside, Great Bookham, and Messrs. A. R. BROWN, LTD., Wychall Nurseries, King's Norton, were again the only competitors, and in each class the awards were made in that order. Mr. DOUGLAS's winning blooms were as follow:—Sells: Daffodil, Golden Oriel, Mme. Carlisle, Mrs. G. Marshall, Mrs. Griffiths Jones, and Rosy Morn. Fancies: Forester, Lara, Liberté, Linkman, Lord Steyne, and R. A. Rowberry. White-ground Fancies: Cæsar and Pompey, Delicia, Felix, Lass O'Gowrie, Millie, and The Bride. Yellow-ground Picotees: Her Majesty, J. Ruskin, Mrs. Lennox, Onward, Santa Claus, and Togo.

For 12 varieties of Sells, Fancies, and Picotees, Mr. J. DOUGLAS and Messrs. A. R. BROWN were again placed 1st and 2nd respectively.

In the second division for four varieties, Mr. A. W. JONES, Stechford, near Birmingham, was placed 1st for Sells; Mr. H. MATHIAS, Medstead, for White-ground and other than White-ground Fancies, and Mr. R. MORTON, Woodside Park, N., for Yellow-ground Picotees. The 1st prize in the class for nine vases of Sells, Fancies, and Yellow-ground Picotees was won by Mr. W. H. PARTON, Moseley.

COLOUR CLASSES.

The open classes for flowers shown as grown, nine blooms of one variety in a vase, with Carnation foliage, were, on the whole, well contested, and formed, perhaps, the most useful group as indicative of the best varieties in their respective colours. The best Rose Self was Mrs. Flight, from Mr. H. MATHIAS, Medstead, but the only other competing flower was Messrs. A. R. BROWN's Ayesha, which received the 2nd prize. Kate Nickleby, shown by Mr. DOUGLAS, was the best white; 2nd, Sir Galahad, shown by Capt. A. GORDON RUSSELL, Wheatley, Oxon. The variety Mrs. G. Marshall won the 1st and 2nd prizes in the class for Maroons, Messrs. A. R. BROWN's flowers being placed 1st and Mr. DOUGLAS's 2nd. In the Yellows, four vases of Daffodil were shown and one each of Cambria and Solfaterra. Mr. H. LAKEMAN, Thornton Heath, won the 1st prize with Daffodil, and the same variety, shown by Miss SHIFFNER, Wallands House, Lewes, was placed 2nd. Adonis and Cardinal were the only Reds staged, the former, from Mr. DOUGLAS, securing the 1st place. The best Yellow-ground Picotee was Mr. H. MATHIAS's Togo, Mr. DOUGLAS's vase of the same variety being placed 2nd.

Elizabeth Shiffner, shown by Miss SHIFFNER, was the winning buff-coloured variety. Pasquin (one of the premier blooms) won the 1st prize for Mr. DOUGLAS in the class for Yellow-ground Fancies, and The Bride, also from Mr. DOUGLAS, in the Fancies other than Yellow or Buff-ground. In the corresponding classes for amateurs (third division), the competition was keener, 11 Yellow-ground Picotees being staged, nine Dark-Reds, and Yellow Sells, eight Buff and White Sells, seven Reds, and five Pinks.

SEEDLINGS.

In the classes for seedlings, the quality of the blooms was weak throughout. Five Sells, four Yellow-ground Picotees, two Bizarres, two Fancies, and one White-ground Picotee were staged, but the only award made was a 1st prize to Messrs. A. R. BROWN, LTD., Wychall Nurseries, King's Norton, for the self-coloured flower Mrs. F. J. Johnstone.

CUPS.

The most important cup was the Martin Ridley Smith Memorial Challenge Cup, offered for the first time last year, when it was won by Mr.

[Photograph by John Gregory.]

FIG. 37.—BORDER CARNATION HERBERT NEWMAN: PETALS WHITE, STRIPED WITH SCARLET.
(Received R.H.S. Award of Merit on the 18th inst. when shown by Mr. A. F. Dutton.)

which in some quarters are held to have been the cause of misconception. Another and more serious change is the omission of the classes for "dressed" Sells. These classes have always been of special interest, and we cannot view their withdrawal without regret. It followed that, although the schedule made provision for a premier Self on a card, no prize was awarded. No novelty of unusual merit was exhibited before the committee. The exhibits from the smaller growers frequently showed evidence of the damage done by thrips.

FLOWERS SHOWN ON CARDS.

In the classes for 18 blooms shown on cards, in not fewer than 12 varieties, Messrs. A. R. BROWN, LTD., Wychall Nurseries, King's Norton and Mr. J. DOUGLAS, Edenside, Great Bookham, were the only exhibitors. Messrs. BROWN were placed 1st for Bizarres and Flakes, Mr.

White-ground Picotees.—Fair Maiden (2), Favourite, Fortrose, John Smith, Lavinia, Lena, Mrs. Herbert (2), Mrs. Openshaw (2), Hon. Mrs. Kenyon, Mrs. G. Chaundy, Polly Brazil, Queen of Spain (2), W. E. Dickson, and Seedling.

Yellow-ground Picotees.—Agnes, Archie Brown, Exquisite (2), Her Majesty (2), John Ruskin (2), Lord Freemantle, Mary Lennox, Mrs. Douglas Galton, Onward (2), Santa Claus, Styx, Taylor's Seedling, and Togo (2).

Competition was keener in the class for 12 blooms displayed on cards, in not fewer than nine varieties. Mr. R. H. TAYLOR, Cheam, was placed 1st with Bizarres and Flakes; 2nd, Mr. C. F. THURSTON, Wolverhampton; 3rd, Mr. H. MATHIAS, Medstead. Mr. A. W. JONES, Stechford, near Birmingham, won the 1st prize for Fancies; Mr. C. F. THURSTON, Wolverhampton, being placed 2nd; and Mr. W. H. PARTON, Moseley, 3rd. The awards for White-ground

H. R. TAYLOR, Cheam. It is offered for 12 distinct varieties of Selfs, Fancies and Yellow-ground Picotees, three blooms of a variety, and is open to amateurs only. Four vases must be shown in each section. Some very fine blooms were staged. Mr. R. MORTON, Woodside Park, London, N., won the Challenge Cup and Medal; 2nd, Mr. W. H. PARTON, Moseley. Mr. MORTON'S varieties were Agnes Sorrel, Daffodil, Elizabeth Shiffner, Erl King, Etna, John Ruskin, Liberté, Lord Steyne, Onward, R. A. Rowberry, Santa Claus and Togo.

The Cartwright Challenge Cup, offered for the best exhibits in the classes open to all (40-48 inclusive), was again won by Mr. J. DOUGLAS, Edenside, Great Bookham, who has thus held it each year since it was first offered in 1908. The awards secured by Mr. DOUGLAS in these classes included four 1sts, two 2nds, and three 3rds. Mr. DOUGLAS also won the Cup for the highest aggregate number of points in the first division (Classes 1-9 inclusive) with eight 1st prizes and one 2nd prize. The Cup for the highest aggregate number of points in the second division (Classes 10-18 inclusive) was awarded to Mr. H. MATHIAS, Medstead, and in the third division (Classes 19-34) to Mr. C. A. LINZEE, Alesford. The Silver Medal, offered for the highest aggregate in the classes for growers of not more than 300 plants, who do not employ a gardener regularly, was won by Mr. J. H. LININGTON, Southlands, Newport, Isle of Wight, who was 1st in each class.

PREMIER BLOOMS.

The premier blooms were as follow:—Flowers on cards: *Bizarre*: Master Fred (Mr. H. MATHIAS); *Flake*: Gordon Lewis (Mr. H. R. TAYLOR); *Fancy*: Linkman (Mr. A. W. JONES); *Heavy-edged White-ground Picotee*: Mary D. Anstiss (Mr. H. R. TAYLOR); *Light-edged White-ground Picotee*: Lavinia (Mr. E. J. PRICE); *Heavy-edged Yellow-ground Picotee*: Agnes (Mr. C. F. THURSTON); *Light-edged Yellow-ground Picotee*: Onward (Mr. J. DOUGLAS).

FLOWERS SHOWN AS GROWN.

Self: Mrs. Geo. Marshall (Mr. A. W. JONES); *Fancy*: Pasquin (Mr. J. DOUGLAS); *Heavy-edged Yellow-ground Picotee*: Her Majesty (Mr. R. MORTON); *Light-edged Yellow-ground Picotee*: Togo (Mr. H. MATHIAS).

NON-COMPETITIVE EXHIBITS.

Non-competitive groups of Carnations were staged by Mr. LAKEMAN, Queensberry Nursery, Thornton Heath; Messrs. PHILLIPS & TAYLOR, Lily Hall Nurseries, Bracknell, Berks.; Messrs. STUART LOW & Co., Bush Hill Park, N.; and Mr. C. BLICK, The Warren Nurseries, Hayes, Kent.

THORNTON HEATH AND DISTRICT HORTICULTURAL.

JULY 15.—The 11th summer exhibition of this society took place in Winterbourne Road Schools on this date. In the class for 12 distinct Roses (open to amateurs and gardeners growing more than 100 Rose plants) the 1st prize was won by the chairman of committee, Mr. E. P. WATSON, Thornton Heath. The 2nd prize was won by Mr. H. S. SNOW, 235, London Road. In the open class provided for those growing fewer than 100 Rose plants, Mr. E. T. BAKER, Norbury, secured the premier award for six distinct Roses with fresh-looking flowers of Konigin Carola, Pharisæer, Marquise de Siney, Marichu Zayas, Marquise de Ganay and Mrs. Theodore Roosevelt; the 2nd prize was awarded to Mr. W. J. DART, Norbury. Some excellent Carnations were staged in the amateur classes, but the flowers would have afforded greater interest if they had been properly named. The managing committee and judges would do well to enforce a more stringent rule respecting the correct naming of plants, cut flowers and vegetables, as this would increase the instructive value of future exhibitions and add to the general interest of the show. Sweet Peas were staged in a fresh condition, but the flowers were lacking in size. The 1st prize offered for six bunches of Sweet Peas, distinct varieties, was won by Mr. G. DAVIDSON, with Masterpiece, Mrs. Hallam, Arthur Unwin, Sun-proof Crimson, Edrom Beauty and Elsie Herbert.

Prizes for Sweet Peas were offered by Mr. Hy. Eckford and Miss Hemus, the 1st prizes being won by Mr. DAVIDSON, Thornton Heath, and Mr. B. LEWIS, Thornton Heath, respectively. Local trade Rose-growers were represented by Mr. F. J. JEFFERIES, Colvin Road, Thornton Heath, who staged a non-competitive group of cut blooms for which a Silver-gilt Medal was awarded. A similar medal was awarded the president, C. T. CHAPMAN, Esq., Thornton Heath, for a group of decorative plants. Variegated Acers, Fuchsias, Gloxinias, Coleus, and other plants were prettily intermingled in a group which gained a 1st prize in the group class. It was shown by Mr. H. S. SNOW. The 1st prize for a table decoration was won by Miss F. HUTTON, with an arrangement of Enchantress Carnations, Gypsophila paniculata and Asparagus plumosus.

CARDIFF AND COUNTY HORTICULTURAL.

JULY 26, 27.—This society's 23rd annual show was held on the foregoing dates, in the Sophia Gardens, Cardiff, which were again kindly lent for the occasion by the Marquis of Bute. Unfortunately, the long drought had rather an adverse effect upon the show, as at the last moment several exhibitors had to withdraw their entries on account of the failure of their crops, with the result that competition was not so keen in many classes as it has invariably been in the past. This was especially noticeable in the case of Sweet Peas, for the large tent devoted to these exhibits was hardly more than half-filled.

From a financial standpoint, too, the Cardiff Society was very unfortunate on the present occasion, as the show was held during a time of great industrial strife in the city.

Messrs. JAMES CYPHER & SONS, Cheltenham, won the 1st prize for a group of miscellaneous plants arranged for effect in a space of 150 square feet. The arrangement was light and graceful, and the plants used were excellent examples of good culture. The centrepiece of the group consisted of an arch faced with virgin cork and furnished with such plants as Asparagus Sprengeri, Origanum Dictamnus, variegated vines, and Fuchsia "Mary," with a Kentia Palm crowning it. Among the flowering and foliage plants in the main group were Cattleyas Plato and gigas, Phalenopsis, Humea elegans, and beautifully-coloured Crotons (Codiaeums). The 2nd prize in this class was awarded to Lady HILL (gr. Mr. McIntyre), for a very tastefully-arranged group. A number of other groups, covering an area of 50 square feet, were set up, but as these were arranged in semi-circles they were not nearly so effective as the larger groups, nor were they so pleasing to the eye on account of the plants and flowers being packed closely together, producing a heavy appearance. In this class, J. L. MORGAN, Esq., Llandaff (gr. Mr. Wall), was placed 1st, while General LEE, Dinas Powis (gr. Mr. Horne), was 2nd.

For 12 distinct varieties of Roses, three blooms of each, the KING'S ACRE NURSERY Co., Hereford, won the 1st prize, which included a Silver Medal. Lyon Rose, Avoca, and N. E. Lippiatt were three of the best varieties shown. The 2nd prize was won by Mr. JOHN CROSSLING, Penarth Nurseries, who showed, amongst others, good blooms of Fisher Holmes and Mrs. J. Laing.

The KING'S ACRE NURSERY Co. were again successful in winning the 1st prize for 12 distinct varieties, three blooms of each, of Tea or Noisette Roses. Marechal Niel, Maurice Grahame, and Mrs. E. Mawley were the most striking varieties in this collection.

Messrs. S. TRESEDER & SON, Cardiff, carried off the 1st prize for a box of 24 blooms of distinct varieties. The blooms most worthy of note in this exhibit were Charles Lefebvre, Duke of Wellington, and Marie Baumann.

For a collection of 18 blooms of distinct varieties of Teas or Noisettes, Mr. H. DREW, Longworth, was placed 1st. H. Kirk, Marechal Niel, and Mme. Constance Soupert were among the most noticeable blooms shown by this exhibitor.

For a collection of Roses arranged for effect in a space of 4 feet 6 inches by 9 feet, height not to exceed 6 feet, Mr. J. CROSSLING was placed 1st. Victor Hugo, Dean Hole, Mme. Jean Dupre, Kaiserin Augusta Victoria, and other choice varieties were employed in this group, which was very effective. Mr. W. TRESEDER, Cardiff, and

Messrs. S. TRESEDER & SON were placed 2nd and 3rd respectively.

Mr. C. WALL, Melrose Nursery, Bath, was awarded the 1st prize, which included a piece of plate, for a collection of border Carnations and Picotees arranged without artificial support in a space of 6 feet by 3 feet. The arrangement of this group was very pleasing, and a number of fine varieties, including Comus (pink) and Eros (yellow) were noticed.

Herbaceous border flowers were again well shown, and formed a striking feature of the exhibition. Mr. F. EVANS, Frome, secured the 1st prize, which included a piece of plate, for a fine collection arranged in a space of 15 feet by 4 feet. Chrysanthemum maximum Kennettii, Gaillardias Lady Rolliston and Superb, and Astilbe Davidii were especially good. Mr. W. TRESEDER, Cardiff, was placed 2nd.

As already stated, Sweet Peas were not shown well. The best exhibit staged was in the class for six distinct varieties arranged in separate vases, with Gypsophila, Fern, or other foliage. Mr. C. H. BRYANT, of Bridgend, was placed 1st in this competition. Three of his best varieties were John Ingman, Maud Holmes, and America Spencer.

In the fruit classes some very good bunches of Grapes were shown, although, in some cases, the berries were not ripe. Capt. MARLING, of Lydney, Gloucester (gr. Mr. W. Cooper), was awarded the 1st prize for two handsome bunches of white Muscat Grapes. The berries were good, but not quite ripe. For two bunches of any other white Grape, H. WEBB, Esq., of Castleton, near Cardiff (gr. Mr. Thomas), secured the 1st place with Buckland Sweetwater, the berries being splendidly coloured. In two classes for black Grapes, E. C. LYSAGHT, Esq., Chepstow, won the 1st prizes with well-finished bunches, the varieties being in one case Black Hambro and in the other Madresfield Court.

The Marquis of NORTHAMPTON (gr. Mr. Searle) was the most successful exhibitor in the class for a collection of nine distinct kinds of vegetables arranged in a space of 20 square feet. In this exhibit Peas, Cauliflowers, Carrots, and Cucumbers were remarkably fine.

TRADE AND HONORARY EXHIBITS.

A gold medal was awarded to the Marquis of BUTE (gr. Mr. Farmer) for a group of stove and greenhouse flowering and foliage plants.

Silver medals were awarded to the following exhibitors:—Mr. MAURICE PRICHARD, Christchurch, for a collection of herbaceous cut flowers; Messrs. DICKSONS, Chester, for a group of miscellaneous cut flowers; Messrs. CLIBRANS, Altrincham, for Sweet Peas; Mr. I. HOUSE, Westbury-on-Trym, for herbaceous cut flowers; KING'S ACRE NURSERY Co., Hereford, for a collection of fruit trees in pots; and Mr. JONES, Kilkenny, for Gladioli and Sweet Peas.

Silver-gilt medals were awarded to Messrs. KELWAY & SON, Langport, for a collection of Gladioli, and to Messrs. ED. WEBB & SONS, Wordsley, for vegetables.

Lord BUTE and the Earl of PLYMOUTH each set up a forestry exhibit, consisting of young growing forest trees, cut timber, and a large number of photographs. A gold medal was awarded to both these noblemen for their collections.

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JULY 20.—This society's annual exhibition of Roses and midsummer flowers, held at the Botanical Gardens, Edgbaston, in delightful weather, attracted a very great number of visitors.

Messrs. GUNN & SONS, Olton, Birmingham, had an extensive group of Roses, in which large bunches of Teas, Hybrid Teas, Hybrid Perpetuals and other sections were beautifully arranged. In the centre of this exhibit some superb blooms of the Lyon Rose were a great attraction. Messrs. GUNN also showed handsome panicles of 20 varieties of Phloxes, together with flowers of Lilium auratum in splendid condition. (Silver-gilt Medal.)

ROBERT SYDENHAM LIMITED, Birmingham, sent a collection of Sweet Peas. A few of the best varieties were Helen Grosvenor, Evelyn Hemus, Barbara, Queen of Norway, Edith Taylor, Maud Holmes, Asta Ohn and several unnamed seedlings. (Silver Medal.)

W. BYNG KENRICK, Esq., Metchley House, Harborne (gr. Mr. J. Webb), had an effective group of double-flowered tuberous-rooted Begonias, *Francoa ramosa* and a good selection of varieties of *Campanula pyramidalis*. (Bronze Medal.)

Messrs. A. R. BROWN, LTD., King's Norton, showed Carnations in great variety and of good quality. A collection of Roses was also included in this attractive exhibit. (Silver Medal.)

Mrs. PEYTON, Augustus Road, Edgbaston (gr. Mr. W. Young), had a nicely-arranged group of foliage and flowering plants, in which silver-leaved *Caladiums* and *Eulalias* were associated with well-coloured *Coleuses* and profusely-flowered *Gloxinias* and *Fuchsias*, the latter as dwarf bushes and tall pyramids. (Silver Medal.)

Mr. C. H. HERBERT, Hazlewood Road, Acock's Green, made an exhibit with hardy flowers and greenhouse plants. He had large bunches of *Galegas*, *Delphiniums*, *Coreopsis*, *Phloxes*, *Gailardias*, and a batch of plants of *Marguerite* Mrs. F. Sander bearing very large, perfectly double, pure-white flowers. (Silver Medal.)

Mr. H. N. ELLISON, West Bromwich, occupied 120 square feet of tabling with a representative collection of Ferns, in which we noted beautiful plants of *Gleichenias*, *Nephrolepis*, *Polypodiums*, *Davallias*, *Adiantums*, *Gymnogrammas* and *Selaginellas*. Mr. ELLISON also showed two dozen well-coloured plants of *Dracæna Bruantii*. (Silver Medal.)

Mr. G. HOLDING, Heathfield Road, Edgbaston, sent plants of seedling *Coleuses*. (Vote of Thanks.)

Classes were provided for Roses, Sweet Peas, hardy herbaceous cut flowers and miscellaneous plants. The most successful exhibitors were: Mr. W. C. BURCHELL, Bourneville; Mr. S. SMITH, Bournville; Mr. R. BRUCE WAITE, Harborne; Mr. W. YOUNG, Edgbaston; Mr. E. DEAKIN, Hay Mills, and Mr. W. HARRIS, Lapworth.

LAW NOTE.

DISPUTE ABOUT A NURSERY.

In the Chancery Division of the High Court Mr. Justice Joyce heard an action recently by Mr. Leonard Wm. Webb, a builder of Lewisham, against Mr. Samuel Griffin, to set aside the sale to plaintiff of the Beaconsfield Nurseries, Trafalgar Road, Portslade, Brighton, on the ground of alleged misrepresentation. Plaintiff also claimed damages. Defendant denied misrepresentation either on the part of himself or agent.

Mr. Hughes, who appeared for the plaintiff, said that the defendant had carried on the nursery in question since 1887, and for three years also had three florist's shops in Brighton. Plaintiff had a brother who had been a nursery gardener for a long time, and knew the business very well. In the early part of last year plaintiff was proposing to buy a nursery with a view to his brother managing it for him. He saw an advertisement in the *Gardeners' Chronicle* for the sale of defendant's business for £1,500, the average returns being stated to be between £1,500 and £3,000 a year. Plaintiff saw the defendant and his agent, Mr. Rich, and the alleged misrepresentations complained of were (1) that the average returns from the nursery (exclusive of the shops) were £1,500 to £3,000 a year, which plaintiff said was nowhere near the truth; (2) that the net profit was £360 to £400 a year; and (3) that the takings from the sales and the nursery itself were enough to cover the expenses. Defendant agreed to take £50 worth of flowers, plants, &c., per week from plaintiff if the latter purchased the property. According to plaintiff's case it was quite impossible for anyone to produce £50 worth of produce a week at the place, but the defendant took scarcely anything. In six months he had only purchased plants to the extent of £177.

The plaintiff, giving evidence, said that Mr. Rich gave him a glowing description of the business and impressed him with the idea that it was a very good thing. After further interviews with the defendant and Mr. Rich, at which the alleged misrepresentations were made, he agreed to pay £1,100 for the business and £125 for stock on ground opposite

the nursery, defendant undertaking to take £50 worth of produce per week all the year round. He, however, never took anything like this quantity, and at the end of six months had only accepted £177 worth of produce. There were only two or three regular customers, who together spent only some 2s. to 5s. a week. The takings were sometimes 16s. a week, but occasionally they were as much as £5 to £6. Up to December he (plaintiff) had sustained a large loss. He put implicit faith in what was said to him in regard to the concern. He believed Mr. Rich's statements that the profits were from £300 to £400 a year, and that the takings would pay the expense of the nurseries. Mr. Griffin had told him more than once that he would never regret his purchase.

Cross-examined, plaintiff said he had no experience in the nursery business, although his brother, who managed the concern, had been in the trade for many years. It was true that his brother had offered himself as manager to Mr. Griffin some time previously. He admitted that the profits would depend on the management of the business, provided that the nurseries were capable of production. When witness took the business there were nine small glasshouses, all of which were in a dilapidated condition. He knew nothing about defendant having expended £1,000 in one year for the purchase of bulbs. Asked as to whether he was aware that the profits on bulbs sometimes amounted to 100 per cent., plaintiff said he would certainly like to see the bulbs that would produce that profit. He admitted expending in one year £500 on bulbs, but he had not calculated what the profit would be on that amount. He denied that at any time conversations took place as to how Mr. Griffin had built up his business, and acquired the land and houses thereon out of the earnings of the nurseries. Plaintiff added that he brought his son and his son-in-law into the business. The former was a plasterer with a taste for gardening, and the latter a grocer's assistant.

Plaintiff was about to re-enter the witness box when his lordship gave a strong intimation that the parties should come to a settlement, and as a result, after consultation, Mr. Boxall announced that they had come to terms.

The action was settled on condition that all charges of fraud be withdrawn and the action be dismissed with costs, defendant to take back the nurseries on certain terms.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

A GARDENER'S NOTICE: *T. W.* It is customary for an under gardener to give or receive one week's notice to terminate his employment.

BEGONIAS AND CYCLAMENS: *F. W. S.* The Begonias are attacked by eelworm. The old plants should be destroyed after cuttings have been taken for obtaining a fresh batch. Sterilise the soil by heating, or mix quicklime with it. The Cyclamens are injured by thrips. Dip the foliage in an insecticide.

FERN FRONDS TURNING BROWN: *J. W.* The plants show no signs of fungous disease. The trouble is caused by a too stagnant atmosphere. Ventilate the house freely in the early morning.

GARDENER'S WAGES ON CORONATION DAY: *A. H. B.* It has been judicially decided that head gardeners employed by private persons come under the category of domestic servants, and if such a servant is absent from a day's work with his master's leave he is entitled to payment; as to an under-gardener, the position is not so clear, and precise details of the facts in any particular case would be necessary before we could express an opinion.

GRAPES: *S. W. O.* and *T. Sims.* No disease is present. Too much moisture in the air is the probable cause of the unsatisfactory condition of the berries.

GRAPES TURNING BROWN: *Stort.* No disease is present. The trouble is due to some error in cultivation.

GROWTH ON ITALIAN POPLAR: *W. E.* The growth is a fungus called *Libertella aurantiaca*. It is not a parasite.

"MOSS" ON LAWN: *R. J., Harrogate.* The plant you send is not a Moss, but the Pearlwort, *Sagina procumbens*, related to the Chickweeds. The turf should receive a dressing of some nitrogenous manure which will cause the grass to grow luxuriantly, and in time crowd out the weed. The presence of Pearlwort indicates a light, impoverished soil.

NAMES OF PLANTS: *La Rose.* *Ailanthus glandulosus*.—*L. B., Tenby.* 1, *Veronica Traversii*; 2, *Spiræa paniculata*; 3, *S. Menziesii*; 4, *Picea orientalis*; 5, *Cedrus Deodara*; 6, *Thuya gigantea*.—*W. E. B.* *Magnolia glauca*.—*T. N.* 1, *Aconitum Lycocotum*; 2, not found; 3, *Sanguisorba canadensis* var.; 4, *Centaurea ruthenica*; 5, *Sedum album microphyllum*; 6, *Cistus florentinus*. Your specimens were badly withered, and the names are given with some diffidence.—*H. A.* 1, *Sedum cœruleum*; 2, *Linaria Cymbalaria*; 3, *Acæna microphylla*; 4, *Gnaphalium margaritaceum*; 5, *Fuchsia Riccartonii*; 6, *Crassula coccinea*; 7, *Lysimachia clethroides*.—*Mustard.* Send the Carnations and *Fuchsias* to some nurseryman who makes a speciality of these flowers.—*Tower Lodge.* 1, *Spiræa ariæfolia*; 2, *Olearia Haastii*.—*Durham.* *Rhyncostylis retusa*, known in gardens as *Saccolabium Blumei*; *Cattleya O'Brieniana*; *Pholidota imbricata* (the brown head of bracts with no flowers); and probably *Bulbophyllum umbellatum*. All the flowers were in bad condition. You should number the specimens.—*A. H. C.* Flower decayed, but it is probably the plant known in gardens as *Hemerocallis Kwanse flore pleno*. It is the showiest Japanese form of *Hemerocallis fulva*.—*F. T.* 1, *Oncidium crispum*; 2, *Odontoglossum gloriosum*; 3, *Dendrobium Pierardii*; 4, *Dendrobium Parishii*; 5, *Calanthe veratrifolia*; 6, *Oncidium candidum*.—*Pinwill.* Specimen quite decayed, except one flower. It appears to be *Crinum variable*.

NARCISSUS BULBS DECAYED: *F. C. E.* The *Botrytis* lily-disease is present. Treat the soil with a mixture of sulphur and quicklime.

PEACHES AND NECTARINES: *Dublin.* The fruits were sent in an over-ripe condition. Send others gathered some days before they are ripe.

PEACHES DECAYED AT THEIR CENTRES: *J. A.* The trouble is caused by an excess of water at the roots; it is probable that the drainage of the border is defective.—*F. H.* Send specimens for examination.

PEACHES DISEASED: *A. H.* Peach mildew is present. Spray the trees next spring when the leaves are unfolding and again when the fruit is set, with liver of sulphur—1 ounce in three gallons of water.

POTATOS DISEASED: *G. W. W.* The tubers are badly affected with a bacterial disease known as "black leg." No cure is known. Diseased tubers should not be used for "sets." Treat the soil with quicklime. Gas lime is even better, but if this is used the ground should remain fallow for some time afterwards.

RHODODENDRONS DYING: *G. P.* No disease is present; probably the soil is unsuitable.

ROMNEYA COULTERI WITH ABORTIVE FLOWERS: *C. E. F.* The trouble seems to be due to constitutional weakness, rather than insect or fungus pest. If you suspect insects, spray the plants with an insecticide.

TWIN CUCUMBER: *F. G.* Syncarpy is common in Cucumbers: we usually receive one or more specimens from readers during the season. A case is mentioned in *Masters' Vegetable Teratology*, p. 47.

VIOLAS AND ASTERS DYING: *W. H. Y.* There is no trace of disease in either the Violas or Asters. The plants afford no clue as to the cause of the mischief.

"COX'S ORANGE PIPPIN."

THIS excellent dessert Apple was raised by a Mr. Cox, who lived at Colnbrook Lawn, Slough, but I have no knowledge of the date. My first acquaintance with it was from a coloured plate in the *Florist and Pomologist*, which, I believe, was at that time owned partly by Mr. Charles Turner, the veteran florist of Slough. This nurseryman was the first to offer trees for sale, in, I believe, 1856 or 1857; but the variety was seldom enquired for, and for some 25 years its value was so little known that its sale had to be pushed in order to clear the stock. In 1875 we had in our nurseries at Maidstone 5,000 standard trees, for we were convinced of its value, but many of these trees had to be consigned to the bonfire for lack of buyers. Soon after this, however, the demand exceeded the supply. The grafting of Apples on the Paradise stock came into vogue about 1878, and trees of Cox's Orange Pippin worked on this stock often cropped in their second year. The fruits on these dwarf trees were so much superior in size and flavour to those grown on standard trees that it soon became the leading dessert variety. In one year we sold 1,300 trees at 3s. 6d. each, and from that period it has stood at the head of all dessert Apples and is now largely planted as a market variety as dwarf trees on the Paradise stock. Dr. Hogg in the *Fruit Manual* states that it is supposed to be a seedling

from Ribston Pippin. Even allowing for the great variation from the parents often seen in seedlings, I cannot agree with this conclusion. The foliage of Ribston Pippin is large, broad and leathery, whilst that of Cox's Orange Pippin is narrow, small, thin and very closely resembles that of Margil; in fact, on maiden trees, the difference in foliage between Margil and Cox's Orange Pippin is very slight. My opinion is that it is a cross between Margil and Golden Reinette.

Once Cox's Orange Pippin became well known, it took the first place amongst dessert Apples, just as Doyenné du Comice takes amongst Pears. When well grown, it is certainly worthy of the premier position, but the mistake is made frequently of planting it in unsuitable soils, with the result that great disappointment awaits the grower. Nevertheless it succeeds in such varied positions that no one can prophesy in advance whether in any particular district it will be a failure or not. I have seen choice fruits of this Apple grown in a low, cold district in an unfavourable year, and I have observed failures in places where, to all appearances, everything existed for its success. The high prices obtained for the fruit in the market justify a trial of the variety in all likely soils; as much as sixpence each has been realized for large, highly-coloured fruits, packed in boxes of 12, whilst 30s. and upwards has been obtained per bushel. A friend in Wiltshire strongly advises me to grow trees of this variety for sale as cordons on the Crab stock, as his specimens on the free stock have large, tough foliage which is not susceptible to fungous diseases. Unfortunately, his experience is the very opposite of mine, which is confirmed by other growers. We find in these nurseries that trees of this Apple grafted on the Crab are more prone to canker, the fruit to develop "spot," and the foliage to take the brown mould than those on the Paradise stock—I refer to standard trees in which the main branches are trained thinly apart and the lateral shoots spurred, as in the case of Espaliers.

One reason of its failure under market culture is that growers have planted large blocks, sometimes amounting to several acres, of this sort alone, thus preventing the needed cross fertilization with another variety. A second fault is that they have over-manured the trees, thereby inducing a late, sappy growth, which the early October frosts damage and render susceptible to attacks of canker. It is no uncommon sight to see vigorous standard trees with all their growths of the previous season killed by canker. Again, they have planted dwarf trees grafted on the unsuitable French Paradise stock. Trees worked on this stock were proved by the late Archibald Barron to die in three or four years at the Royal Horticultural Society's old gardens at Chiswick. In some cases the dwarf trees are budded too high, even on the approved Paradise stock, and thus the growth is restricted by strangulation, the scion overgrowing the stock and forming a large, woody, globular outgrowth. The

variety requires a warm, genial summer to obtain satisfactory results, and the cold, wet seasons of 1909 and 1910 were most unsuitable to it, causing old and young trees to become cankered and the growths to die back wholesale. Washes proved of little avail as a remedy, because they were washed off by the frequent showers, almost as soon as they were applied. For these reasons the variety is in disrepute among market growers, and thousands of trees have been cut down and re-grafted with Bramley's Seedling, a gross grower, which is said to give new life to the old stool, resulting in Bramley's Seedling fruiting earlier than usual. This experiment should be watched with interest.

It is evident, therefore, that, as a general rule, trees of Cox's Orange Pippin should only be planted in warm, loamy soils and in protected positions. It will repay any care given to the trees in the summer-pruning of the laterals in August, because this will keep the boughs free and open, admitting the light and air. Owing to better weather conditions this year, the trees have made healthy leaves and set a fine crop of good fruit. Thus everything points to the need of a genial season, and, where the district is an unfavourable one, to the planting of the trees on a west, and, in very cold districts, a south wall. The presence of canker is often overlooked in its young state; in cold seasons the foliage may be spotted with dark brown spots, and these in some way communicate the canker to the young shoots, which, on a close observation, are found to have small pustules upon them, developing canker the following season. Therefore, at the winter pruning it is needful to cut back to healthy wood and to burn the affected shoots.

In summer, the spotted leaves which fall should be collected and burnt as the spores of the disease may infect the growth the following year. The trees should receive a winter dressing of caustic soda or some other strong wash, and be further sprayed at the time the buds expand with Bordeaux Mixture.

I find that espalier and pyramid trees of Cox's Orange Pippin are often injured by a too drastic root-pruning; therefore, only one side should be root-pruned at a time. In place of constant applications of farmyard manure I advise, for light soils, a dressing of basic slag, nitrate of soda or kainit, and, for heavy soils, guano and soot, to be hoed in the soil in March.

Admitting that Cox's Orange is the best-flavoured dessert Apple generally known, I am of the opinion that, for richness of flavour and digestible texture, it is superseded by Roundway Magnum Bonum, the flesh of which is more melting and delicious. Its appearance would suggest a cooking fruit, but, although very large, it is delicious in flavour, and, when cooked in any form, needs no spice. As an earlier dessert fruit than Cox's Orange I consider American Mother, which ripens in October, the best, whilst Lady Sudeley is one of the choicest of the very early varieties. *George Bunyard.*

NEW OR NOTEWORTHY PLANTS.

SENECIO PRAINIANUS, N. SP.*

THIS new shrubby Senecio was procured two years ago, together with *S. Barba Johannis*, from Mr. Willy Müller, of Nocera inferiore, under the wrong name of *Senecio calcareus*. Mr. Willy Müller received these plants, together with many others, from the Cavaliere Charles Sprenger, formerly of Naples, now superintendent of the Imperial Gardens of Achilleion, Corfu. Mr. Sprenger kindly informs me that this and the other *Senecio* were collected for him some time ago by Mr. A. Purpus in the Barrancos of the mountain chain above Vera Cruz.

As the genus *Senecio* is a vast one, and as no monograph of it exists, it would have been an impossible task for me, with the limited library and herbarium at my disposal, to ascertain whether this plant was already described or not, had it not been for the kind help given me by the directors, both of the gardens and herbaria at Kew and Dahlem.

In habit, the new species much resembles the old and well-known *Senecio Petasitis* DC., which is a very ornamental species, where it can be grown in the open. So far, our plant is about 1 metre high. It has very ornamental foliage. The leaves measure 12-16 cm. in breadth, the petioles are 9-10 cm. long. The leaves near the inflorescence are gradually getting smaller. They are nicely palmato-lobate and rather fleshy; in shape somewhat intermediate between the form of a vine and an Ivy leaf. The inflorescence is a drooping, richly-branched and elegant panicle. The flower-heads, when opening, are of a pleasing yellow, fading to brown. With us at La Mortola the plant flowers from February till April.

I take great pleasure in naming this ornamental plant in honour of Lieut.-Col. Dr. D. Prain, Director of the Royal Gardens, Kew. A. B.

DENDROBIUM AGGREGATUM.

THE plant of *Dendrobium aggregatum* represented in fig. 38 is growing in the gardens of the Agri-Horticultural Society of Burma, Kandawglay, Rangoon, the photograph having been forwarded by the superintendent, Mr. J. Gibbons. *D. aggregatum*, which first flowered in England in 1834, from plants distributed by the Royal Horticultural Society, is widely distributed in Burma, and has also been found in China. The plant is of tufted growth, the pseudo-bulbs being monophyllous and about 2 inches in length; the flowers are yellow, with an orange-coloured disc to the lip. The plant grows best in cultivation on blocks or rafts in an intermediate house. The much smaller *D. Jenkinsii*, which has compressed pseudo-bulbs, and produces flowers singly or in few-flowered racemes, is sometimes known in gardens as *D. aggregatum*; indeed, the plant has been figured under that name.

* *SENECIO PRAINIANUS* BERGER N.SP.—Affinis *S. suffulti* Greenm.—Frutex ramis erectis glabris teretibus subcarnosis brunneis. Folia alterna, longe petiolata, suborbiculata, basi cordata, angulato-lobata, lobis 7-9 ovato-deltoides sinibus rotundatis divis, lateralibus et terminalibus majoribus subtrilobulatis, ad margines minute ciliata, dentibusque distantibus parvis cartilagineis munita, supra viridia, asperiuscula, subtus pallidiora nervis prominentibus pubescentibus; petioli carnosius patentibus rubelli pubescentibus; inflorescentiae terminales, paniculato-corymbosae nutantes foliaceo-bracteatae; pedunculi divaricato-ramosi pubescentes basi et medio bracteis subsessilibus muniti, bracteae inferiores ovatae dentatae, superiores ovato-lanceolatae, omnes acutae patentibus vel recurvae. Capitula basi bracteis 1-3 lanceolatis acutis patentibus calyculata, involucrum cylindraceum squamis 8-10 lanceolatis dorso asperulis constans, flores 30-35 omnes tubulosi flavi involucri superantes lobis revolutis; antherae basi rotundatae; achenia glabra, striata, pappus setis albis scaberulis.

Mexico, in montibus supra Vera Cruz; frutex a cl. A. Purpus lectus et in Hortulum cl. C. Sprenger introductus, primum floret in Horto Mortolensi mensibus Febr.-April, 1910.

"DIE-BACK" OF GOOSEBERRIES.*

THE Sclerotinia disease of the Gooseberry—or "die-back," as it is called in some districts in Kent—is wide-spread in England, and is liable to occur wherever Gooseberries are grown, whether in plantations or in private gardens. It attacks bushes growing on stiffish clay as well as bushes growing on light, gravelly or stony soils.

The Gooseberry bush may be attacked in four distinct places, viz., the main stem and base of the branches, the young wood of the current year, the leaf, or the berry. As regards the main stem, the spawn (mycelium) of the fungus penetrates into the tissue (permeating the cortex

the stem to the base of the branches. Here it frequently attacks some of the branches so severely that they die. The presence of dead branches in a few bushes, or the death of half the bush, is a characteristic sign of the first appearance of the Sclerotinia disease in a plantation. And, as is noted below, it is at this time that steps should be taken to stop the disease.

Renewed growth of the spawn of the fungus in the stem takes place every spring, and it is at this time that the manner in which fungus exists and spreads can be most easily seen. If a diseased stem be examined during a warm and damp spell of weather in the spring, the bark will be found to be peeling or cracking off, while greyish, fluffy patches of a "mould" ap-

FIG. 38.—DENDROBIUM AGGREGATUM.
(In the Gardens at Kandawglay, Rangoon.)

and bast), and at the end of a season's growth causes the bark to crack and peel off, often in large pieces. The part of the stem first attacked is usually that portion situated at the ground level or a little above it; eventually the spawn of the fungus "rings" the stem at this place and the whole bush is killed. Before this occurs, however—and death does not occur as a rule in the case of a well-grown bush until after several seasons from the time it was first attacked—the spawn of the fungus spreads upward in

pear at the edges of the peeling bark or in the fissures where the bark is cracked.

If there is a dead branch on the bush, then, as a rule, small greyish tufts or little cushions—which soon develop in suitable weather into fluffy patches will be found scattered here and there over its surface. These tufts of the fungus occur both on the main branches nearly down to their base, and frequently also on the younger wood.

Little hard, blackish bodies, of irregular shape, named sclerotia are also produced. They are extremely resistant to climatic conditions such

* Extract from Leaflet No. 248 issued by the Board of Agriculture and Fisheries.

as frost, drought, etc., and serve to carry the fungus through all vicissitudes from one growing season to the next.†

If an affected bush has been weakened by the Sclerotinia disease in previous seasons, the renewed growth of the fungus during the spring will frequently cause the death of the bush. In the affected plantation Gooseberry bushes here and there may suddenly wilt and die out in all stages of growth; this occurs most frequently at the time when the leaf-buds have just burst open, but often also at a later stage when the bush is in full flower or bearing young berries. If such bushes are examined the stem will be found to be "ringed" by the spawn of the fungus, and on the surface of the stem will be found the Botrytis fructification. If the disease has not developed to a sufficient extent to kill the bush, the spores which are continually being produced throughout the spring and early summer serve to spread the disease to other parts of the bush.

Very commonly the spores affect the leaves, which then soon show a discoloration at their edges, which are first turned yellowish, and finally become ashy-grey or whitish. If the attack extends from the edge of the leaf inwards until the greater part of the leaf is affected, the fall of the leaf soon takes place; if, however, as is often the case, the injury remains restricted to the edges of the leaves, the latter remain on the bush until the usual time for the fall of the leaf. Whether the injury spreads over the leaf to such an extent as to make it fall prematurely seems to depend on the climatic conditions which prevail at the time. When a large number of leaves are attacked throughout a plantation and made to fall prematurely, serious damage is often inflicted; in such cases the berries produced are much smaller than on healthy bushes, and a quantity of unripened spindly shoots may be formed. The under-surface of the leaf is the part attacked, and during the months of June and July the Botrytis fructification may be found on leaves.

Another part of the bush which may be attacked is the young wood. In the case of young bushes especially, a considerable proportion of the young shoots may be attacked and much weakened or killed—a fact which has caused growers to speak of the present disease as "die-back." Infested dead shoots may constitute a prolific source of infection. Prunings of Botrytis-affected bushes left lying in a heap in a corner of the plantation or garden may develop during the following spring an abundant crop of powdery tufts of Botrytis, the spores of which, carried by the wind in countless numbers, will spread the disease through the plantation. There is also the danger of cuttings being taken from affected bushes, when many of the young bushes thus obtained will become diseased. In one case which was investigated it was found that a lot of 2,000 young bushes of "Crown Bob," planted out direct from a nursery, were already diseased—the young shoots harbouring the Botrytis stage of the fungus.

Lastly, the fungus occasionally attacks the berry and turns it rotten. The first sign of the appearance of the disease on the berry is the browning of the skin at some spot; this browning gradually extends until one side of the berry shows obvious signs of softening and of being badly diseased. The Botrytis fructification, in the form of the characteristic ashy-grey "mould," then soon appears on the surface of the discoloured portions, and the berry in a week or so is turned completely rotten and decays.

† These sclerotia are also able under certain conditions to give rise to another form of fructification in which winter-spores (ascospores) are produced. In this stage the fungus has been known under the name of Sclerotinia, while the name Botrytis has been applied to the stage where summer-spores only are produced. It is probable that the Sclerotinia stage with its winter-spores, only rarely occurs. It is certain that the disease can be perpetuated from season to season in its absence by means of the Botrytis stage, which by means of summer-spores spreads the disease during the growing season, and then remains dormant in the form either of mycelium in the stem or of sclerotia on its surface—both enabling the fungus to hibernate during severe winters.

REMEDIES.

1.—The best means of getting rid of the disease are the prompt removal and burning of all dead bushes or dead branches in the plantation. As soon as the leaves of bushes show the disease, the bushes in the plantation generally should be examined and any bush found with the main stem diseased should be grubbed up and burned. The prompt removal and burning of all dead (or dying) bushes, carried out for a few seasons, has proved more efficacious against this disease than spraying. It must not be forgotten that this fungus is capable of developing vigorously on dead parts of the bush. In nearly all cases—except in the comparatively rare ones where a plantation has been planted up with Botrytis-infested young bushes—the disease appears first either on single bushes scattered here and there through the plantation, or on all the bushes over a small patch of ground in the plantation, while the surrounding bushes are healthy. If the disease on its first appearance is dealt with summarily by the burning of all dead bushes and dead branches, there is no need to spray or to take any other remedial measure, since the disease soon completely disappears.

FIG. 39.—PHILADELPHUS HIRSUTUS: FLOWERS CREAMY-WHITE.

2.—Where the disease has been allowed to become severe and widespread, or where it is not in the power of the grower to remove entirely the source of the disease, spraying must be resorted to—in addition, of course, to the prompt burning of all dead bushes. A heavy spraying with a solution of copper sulphate (4 lb. dissolved in 100 gallons of water) should be given just before the buds burst, with the object of destroying the tufts of Botrytis, care being taken to spray heavily the main stems of the bushes. The infection or premature falling off of the leaves may be prevented by spraying, directly the fruit is set, with Bordeaux mixture composed of 8 lb. copper sulphate, 8 lb. quicklime, and 100 gallons of water. In this spraying it is essential that the under-surface of the leaves should be sprayed as much as possible. No injury follows the application of Bordeaux mixture of this strength, and if the spraying be done at the time indicated no spotting of the berries occurs.

3.—It may be noted finally, that any treatment which induces the bushes to make vigorous growth tends to stop the attacks of the fungus.

PHILADELPHUS HIRSUTUS.

THIS is one of the rarest and most graceful of the species. It has been grown for many years in the Cambridge Botanic Garden, but has not been found in other gardens where collections are most complete. In habit it is very distinct from all others, producing long, slender wreaths of flowers, of which the small, short twig in the accompanying illustration affords an example (fig. 39). The cup-shaped flowers are small and neat, and are borne usually in threes to each leaf on twigs which grow with numerous nodes to a length of 18 inches or more in the way illustrated. The leaves are ovate-oblong, distinctly hairy on both surfaces, but especially below, and they are strongly serrated, but not so coarsely as in most other species. The plant grows to a height of 5 or 6 feet, and may be regarded as one of the smaller species. Specimens from our shrub were compared with Herbarium specimens at Kew last year, and were found to be identical. So many hybrids have been raised of recent years, and they are so good, that hybridising with this plant is not to be suggested, but there is no doubt that it could be used as a parent with useful results. The plant is propagated readily from cuttings. It is a native of North America, and is figured in the *Botanical Magazine*, tab. 5334. R. Irwin Lynch, Botanic Garden, Cambridge.

PLANT NOTES.

LEEAE AMABILIS SPLENDENS.

I HAVE often wondered why this distinct and handsome plant is so seldom grown in gardens. The Leeas are essentially tropical subjects, and for their maximum development require, during their growing season, a considerable amount of heat and moisture, combined with liberal feeding at the roots. Under these conditions, growth is very rapid, and ample space is required for the proper development of the large, pinnate leaves, which form the principal attraction of the plant. When in good condition, the leaves and the growing portions are suffused with bronzy-red, the decorative effect being enhanced by the broad, median, lucent band with which each individual leaflet is marked. Fred. W. Jeffery, Woodend Gardens, Renfrewshire.

NOTICES OF BOOKS.

BRITISH FERNS.*

THIS little book is admirably adapted for the pocket, and its portability is its chief recommendation, its contents consisting of an enumeration of the common species of Ferns and their habitats, prefaced by some chapters detailing their life history. Only one allusion is made to the wonderful capacity of Ferns for variation, the case of *Polypodium vulgare* var. *cambricum*, which could hardly escape citation, the author explaining that he has ignored the many varieties, because he intends to publish another volume dealing with this subject. In differentiating the Shield Ferns, *Polystichum aculeatum* and *P. angulare*, he omits the chief distinction, viz., that the latter has definitely stalked pinnules, while those in the former are wedge-shaped and have no definite stalk at all, the distinction relied upon by experts. Considerable space is devoted to naming the counties in which the species are found, though some of them are so ubiquitous as to involve the naming of nearly all the counties. Certain omissions are to be noted in this part of the book: thus *P. angulare* has been found in Wigtown and Perthshire, and *Pteris aquilina*, recorded in the work as absent in Monmouthshire, grows rankly and abundantly by the roadside near Chepstow in the form of *P. a. revolvens*. These, however, are minor points; on p. 5 the "stigma" of a flowering plant is described as the male organ which provides the pollen, and, on p. 11, in "Definitions," we meet with the statement "Cryptograms. These plants whose fructification is hidden away or concealed, so to speak, like the spores of Ferns partly—at least—concealed because borne on the backs of the fronds, and not usually seen until the fronds are turned up." The term is mis-spelled, and the definition is wrong.

* *British Ferns*, by Francis George Heath. (Sir Isaac Pitman & Sons, Ltd.) Price 2s. net.

THE FLOWERS OF CHAUCER.

(Continued from page 43.)

DAPHNE.

I saw the Daphne closed under rynde.
Complaynte of a Lovers Lyfe, VIII. 8.
 See Laurel.

DATE.

Fyges, and many a date tree.
Romaunt of the Rose, VII. 58.

Chaucer may have seen the Date Palm in his Italian travels.

DOCK.

Nettle in dokke out.
Troilus and Cryseyde, V. 196.

An old English proverb, generally put "In dock out nettle," the Dock leaf being commonly considered a sure cure for a Nettle sting.

EGLANTINE.

1. The hegge also
 With sicamour was set and eglatere.
Flower and Leaf, IV. 239.
2. I felt so swete an aire
 Of the eglentere.
Flower and Leaf, IV. 239.
3. That gave so passinge a delicious smelle,
 According to the eglentere ful welle.
Ib. 240.

By the early poets, including Chaucer, the name Eglantine was given to the Sweet Briar; by later poets it is given to the Honeysuckle.

ELDER.

Or elles of elder bery, that growith there.
Nonne Prest his Tale, III. 220.

Elderberries are in Chaucer's long list of laxatives.

ELM.

1. Wilw, elm, plane. *Knights Tale, I. 182.*
2. The pillar elme, the coffre unto caraine.
Assembly of Fowles, IV. 195.
3. There were elmes grete and stronge.
Romaunt of the Rose, VII. 59.

Chaucer's Elm was what we now call the wych Elm, and "the pillar Elm" means the Elm as a support for vines, and is a rough translation from Ovid's list of trees, "*avicti vitibus ulmi*," and "the coffre unto caraine" describes its use for coffins.

EW. See Yew.

FENNEL.

Doun by a lytel path I fonde
 Of mentes fulle, and fenelle grene.
Romaunt of the Rose, VII. 37.

FERN.

Som seiden that it was
 Wonder thing to make of ferne aisschen glas,
 And yit is glas nought like aisschen of ferne,
 But for they han i-knowen it so ferne;
 Therfor cesseth her janglyng and her wonder.
Squyeres Tale, II. 210.

The use of Fern ashes for potash in the manufacture of glass was not uncommon in the early days of glass-making, especially in France.

FIG.

1. Thay sowede of fige leves in maner of
 breches. *The Persones Tale, IV. 32.*
2. A fig for all her chastity.
Court of Love, IV. 155.
3. Fyges, and many a date tree.
Romaunt of the Rose, VII. 58.
4. The God of Love
 Was stondyng by a fige tree. *Ib., 69.*

The Fig tree was introduced into England long before Chaucer's day.

FILBERT.

The philbert eke, that lowe dothe enclyne
 Her bowes grene to the erthe doune,
 Unto her knyght ycalled Demophoune.
Complaynte of a Lovers Lyfe, VIII. 8.

The reference is to the story of Demophon and Phyllis related by Ovid; she was turned into a filbert after her suicide for love of Demophon.

FIR.

1. Ook, fyr birch. *Knights Tale, I. 182.*
2. The sailing firre.
Assembly of Fowles, IV. 195.
3. Asshe, firre, and oke.
Complaynte of a Lovers Lyfe, VIII. 8.

"The sailing firre" means that it is used in ship-building. Spenser uses the same descriptive epithet, "the sayling Pyne." See also Pine.

FLAX.

This pardoner hadde heer as yelwe as wex,
 But smothe it heng, as doth a strike of flex.
The Prologue, I. 105.

FLEUR DE LIS.

His nekke whit was as the flour-de-lys.
The Prologue, I. 88.

As Chaucer's de lis was white, I think he must mean the white Lily, though the name is more often given to the Iris.

FUMITORY.

Lauriol, century, and fumytere.
Nonne Prest his Tale, III. 220.

Fumitory is the English form of *Fumus terræ*, the *Fumaria officinalis* of botanists. It has the same name, more or less changed, in most of the European languages.

GAITER.

Of catapus, or of gaytre beriis.
Nonne Prest his Tale, III. 220.

Gaiter, variously spelt, is an old name for the Dogwood; now obsolete.

GARLICK.

Wel loved he garleek, oynouns, and ek leekes.
Prologue, I. 103.

GILLIFLOWER.

1. As clowe-gelofre, and lycorice.
Romaunt of the Rose, VII. 58.
2. And many a clow gilofre.
Tale of Sir Thopas, III. 119.

Gilliflower is the name given confusedly to many flowers of sweet smell. The flower meant is in most cases the Wallflower, and in others the Carnation.

GOLD. See Marygold.

GOURD.

I have heer in a gourde
 A draught of wyn, is of a ripe grape.
Prologue of the Maunciples Tale, III. 239.

The Gourd dried was commonly used to make pilgrim- and other bottles.

GRAPE.

1. See Gourd.
2. Nor of the reisins have the wyne,
 Till grapes be ripe and welle afyne,
 Be sore empressid, I you ensure,
 And drawn out of the pressure.
Romaunt of the Rose, VII. 127.

Wine pressed from home-grown Grapes was a common drink in Chaucer's time.

GRASS.

1. And every gras that groweth upon roote
 Sche schal eek know, to whom it wol do
 boote. *Squyeres Tale, II. 207.*
2. Under the which the grasse, so fresh of
 hewe,
 Was newly sprong.
Flower and the Leaf, IV. 238.
3. It forgrown was with grasse and weede.
Ib., —.

4. The grene grass,
 So smale, so thicke, so short, so fresh of
 hewe. *Ib. 239.*
5. On the sote grasse
 I sat me downe. *Ib. 241.*
6. Ther never yet grew corne ne gras.
Boke of the Duchesse, VI. 141.
7. Downe by a floury grene went
 Ful thikke of gras, ful softe and swete.
Ib. 149.
8. Grasses growen in a mede.
House of Fame, VI. 238.
9. That sonne might there noon descende,
 Lest the tendre grasses shende.
Romaunt of the Rose, VII. 59.
10. Conies
 maden many a turneiing
 Upon the freshe gras spryngyng. *Ib. 60.*
11. Sprang up the gras, as thikke sette
 And soft as ony velvet, *Ib.*
12. Aboute it is gras spryngyng,
 For moiste so thikke and wel likyng,
 The it ne may in wynter dye,
 No more than may the see be drye.
Ib. 64.
13. Neither thurgh gras ne rote,
 Ne hadde I hope of helpe ne bote.
Ib. 70.
14. Doune on knees anon ryght I me sette,
 * * * * *
 Upon the smale, softe, swote gras.
Legende of Goode Women, VIII. 48.

I know of no English poet that has told his delight in well-shorn grass as Chaucer has in these passages. Then, as now, well-kept lawns were the glory of English gardens.

HAWTHORN.

1. To make him a garland of the greves,
 Were it of woodewynde or hawthorn leves.
Knights Tale, I. 136.
2. Within a temple shapen hawthorn-wise.
Court of Love, IV. 179.
3. Hawthorn brought both page and grome.
Ib. 183.
4. Into an hauthorne by that broke.
Cuckow and the Nightingale, IV. 230.
5. Chapelets * * * * *
 Some of hauthorne, and some of the wood-
 bine.
Flower and the Leaf, IV. 246.
6. Nay such abodis be not worth an hawe.
Troilus and Cryseyde, V. 145.
7. Avayleth nought thre hawes.
Ib. 226.
8. The cherle thei founden hem afor
 Liggyng undir an hawethorn.
Romaunt of the Rose, VII. 136.
9. There sawe I eke the fressh hawthorne.
 In white motele, that so soote doth smelle.
Complaynte of a Lovers Lyfe, VIII. 8.

Chaucer's Hawthorn needs no comment.

HAZEL.

1. Mapul, thorn, beech, hasil.
Knights Tale, I. 182.
2. Hasil wodis shakyn!
Troilus and Cryseyde, V. 146.
3. From hasel woode, ther jolye Robin pleyde.
Ib., VI. 28.

HOLLY.

Betwex an hulfere and a wodebynde.
Complaynte of a Lovers Lyfe, VIII. 10.
 Hulfer was a name given to more than one tree; here it is the Holly.

HOLM.

1. Holme to whippes lasshe.
Assembly of Fowles, IV. 195.
2. Asp, aldir, holm, popler.
Knights Tale, I. 182.

In Chaucer's time this was another name given to the Holly. By later writers the name was given to the Holm Oak or Ilex. The Holly is still used largely for whip handles. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

(To be continued.)

SAUSSUREA VEITCHIANA.

THE genus *Saussurea* includes nearly 70 species of hardy perennials, mostly found in the mountains of Europe, Asia, and North America; one species, *S. alpina*, is a rare native of Britain. Very few of them have any horticultural value, this new species, *S. Veitchiana* (see fig. 40) being probably the most striking, but it is not by any means a beautiful plant. When collecting for Messrs. T. Veitch & Sons, Mr. E. H. Wilson obtained seeds of *S. Veitchiana* at Fang in Central China. Plants were raised in 1902, and two specimens were presented by Messrs. Veitch to the Glasnevin Gardens. They flowered last year, and furnished the material for an illustration in the *Botanical Magazine*, tab. 8381.

The plants are quite hardy, and are flourishing on a sunny border in light, deep soil. They

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See *Tables and Summaries, ante*, pp. 64-70.)

O, SCOTLAND, N.

ELGIN.—No rain has fallen in this district for about six weeks, and as the soil here is very light in texture, the fruit crops are not up to their usual good standard. *John Macpherson, Mayne Gardens.*

MORAYSHIRE.—The fruit crops in this district are looking remarkably well. The dry weather during May and June did considerable damage in some parts; but rain came in time to save the Strawberry crop. Gooseberries are smaller than usual. The Apple crop suffered at first from want of moisture, but it is now satisfactory. Wall fruits are much better than was expected earlier in the season. Our soil is mostly a sandy

of individual trees being quite barren. The most fruitful varieties include Bismark, Stirling Castle, Wealthy, Bramley's Seedling, Chas. Ross, Lord Grosvenor, Ecklinville Seedling, Keswick Codlin, and New Hawthornden. The crops of Pears and Plums are very disappointing, notwithstanding the mild winter and spring. Late spring frosts were not so common as usual, although 2° was registered on June 15. The trees blossomed badly, whilst the individual flowers were poor and lacked substance. The cause must be sought for in the cold and wet summer of 1910, when the wood did not mature properly. Small fruits are extra good. Strawberries only average; but Morello Cherries are very plentiful. Peaches and Apricots are not largely grown out-of-doors in this district. These gardens are situated in a close proximity to hills, and are 450 feet above sea-level. The average rainfall amounts to about 42 inches. The soil consists of a heavy loam, containing a certain amount of alumina, and rests on a hard, clayey-gravel subsoil, which is not conducive to good drainage. *William L. Minty, Ardross Castle Gardens, Alness.*

SUTHERLANDSHIRE.—The fruit crops in this district are generally good. The weather in spring was very favourable to the setting of the blossom, there being an absence of frost. The drought proved trying to Strawberries, but though the berries were smaller than usual, there was an abundant crop. Our soil is a fairly deep one, light in texture, and rests on gravel and sand. *D. Melville, Dunrobin Castle Gardens, Sutherland.*

1, SCOTLAND, E.

ABERDEENSHIRE.—All small fruits are good crops, especially Currants. Strawberries were a small crop, owing to the drought. Apples are a better crop than they have been for some years. *James Grant, Rothienorman Gardens.*

—The fruit crops generally in this district are over the average, both as regards quantity and quality. Apples and Peaches are particularly good. Small fruits also are good, Strawberries, Black Currants, and Gooseberries being very plentiful, which may be attributed to the fine weather. The soil here is a rather heavy, although rich loam, the subsoil having a slight indication of clay. *John McKinnon, Haddo House Gardens.*

—The fruits crops in this district give promise of being considerably above the average this season. Apples especially, and most of the small fruits promise to be heavy crops. This being a late district, the fruits are too immature for me to give an exact statement as to their quality, but they promise well so far. Apples were practically a failure in these parts last year, and the rest the trees had in consequence may partly account for the heavy crops they are carrying this year. The soil in these gardens is a good, friable loam. *W. Henderson, Meltrum House Gardens.*

BANFFSHIRE.—The fruit crops in this district are a fortnight in advance of ordinary seasons. There are many complaints of Black Currants dropping in May and the early part of June. Gooseberries are a heavy crop, but the fruits are small. Strawberries were not so large as usual this season, owing to the dry weather in the early part of June. Raspberries are very promising. *Geo. Edwards, Ballindalloch Castle Gardens.*

—The fruit crops in these gardens are well above the average in quantity. Apples are an exceptionally heavy crop, so much so that nearly every tree had to be thinned of some of the fruits. Pears are a very light crop, and this is difficult to understand; as there were plenty of flowers and ideal weather conditions while the trees were in blossom. All small fruits are very plentiful. Peaches out-of-doors are satisfactory: the foliage has been only slightly affected with blister this season. Our soil is a dark loam resting on sand. *Alex. Morton, Cullen House Gardens, Cullen.*

BERWICKSHIRE.—Apples generally crop well in this district, especially the variety Bramley's Seedling, which is the maincrop Apple in these parts. Plums are scarcely ever a failure here, whilst small fruits are always plentiful. Black

[Photograph by C. F. Ball.]

FIG. 40.—SAUSSUREA VEITCHIANA: FLOWERS PURPLISH-BLACK.

have grown 2 feet high, and the radical leaves have undulate margins. The leaves are 9 to 12 inches long by about 1½ inch broad, light green, with a stout mid-rib, and hairy beneath. The stem leaves are amplexicaul with partly auriculate bases. Bladder-like membranous bracts partly enclose the flower when young, and these bracts have a purplish tint. The flowers are of a deep, purplish-black colour, and give to the plant a remarkable appearance. The anthers are black and have woolly tails; the feathery pappus is purplish. *C. F. Ball, Glasnevin Botanic Garden.*

loam, with a rough, gravel subsoil. *Alex. Dow, Darnaway Castle Gardens, Forres.*

—Fruit trees of all kinds had a good show of blossom, and, although the weather was all that could be desired during the flowering period, the fruit did not set well. This was especially the case with Pears, Peaches, and Cherries. The rains came too late to save the earlier Strawberry crop; but later sorts, as well as all other small fruits, have greatly benefited by them. *Chas. Webster, Gordon Castle Gardens, Fochabers.*

ROSS-SHIRE.—While the Apple crop generally is above the average, there are several instances

Currants are generally free from attacks of mite. Pears succeed very badly, as the soil is not suitable. Cherries set well, but, owing to the dry weather in May, half of the fruits dropped. Strawberries received a check in May, but, notwithstanding this, berries have been plentiful. Apricot fruits will be small owing to the drought. Our soil is very light in texture, with a gravel subsoil: the depth of top soil is 7-8 inches. *Peter Smith, Duns Castle Gardens, Duns.*

—Fruits of all kinds set well, and promised unusually fine crops, but owing to the extremely dry weather the bulk of them, with the exception of Apples, dropped after attaining a considerable size. The soil here is very light, and dries very quickly. The subsoil is sandy. *R. Henderson, Ayton Castle Gardens.*

CLACKMANNANSHIRE.—On my travels throughout Scotland I find that on light sandy soils the Apple, Pear, and Strawberry crops are almost complete failures, but on heavy soils the crops are about an average. *Alexr. Kirk, Consulting Gardener, Alloa.*

HADDINGTONSHIRE (EAST LoTHIAN).—The soil of the district may be described as a medium loam of great fertility, overlying in the most part gravel or the old red sandstone formations. A small portion of the county overlies a clay formation. Owing to the absence of frost and favourable ripening weather in the previous autumn, a record set of blossom was obtained in many classes of out-door fruits. The setting period, however, was followed by a spell of dry weather of exceptional duration. During the latter part of this period the heat was so intense that a great quantity of fruit, both large and small, was shed by the trees and bushes. As a result, where an abnormal crop was promised, there only remained an average one, and in many cases the remaining crop is under the average. *Thomas Macphail, Archerfield Gardens, Dirleton.*

—Fruit trees of all kinds are very healthy, with clean foliage. The fruit crops as a whole are of a good average quantity, with the exception of Strawberries, which were adversely affected by the drought and the intense heat. The later crop of Strawberries, however, is not unpromising. *R. P. Brotherston, Tynninghame Gardens.*

FIFESHIRE.—Apples set well, but the fruits are suffering from the continued dry weather. The Pear crop in this district is almost a failure. Plums are very scarce. Cherries on wall trees are a very good crop. Apricots are scarce, but the quality of the fruits is good. Gooseberries, Black Currants, and Red Currants are all good crops. There were plenty of Strawberries, but the fruit and especially the early berries, were under an average size. *D. McLean, Raith Gardens, Kirkcaldy.*

—The crops of larger fruits, with the exception of Apples, are very disappointing. The trees were smothered with blossom, but the fruits set badly. Small fruits promised well, but owing to the dry weather, much of the fruit dropped. The soil is a good garden loam, 2 to 3 feet deep, resting on a cold clay sub-soil. *William Henderson, Balbirnie Gardens, Markinch.*

FORFARSHIRE.—The prospects for very heavy crops of all fruits were, at the beginning of May, good, but, unfortunately, there has been very little rain since then. From this cause the early Strawberries were almost a failure, although with dews at night the later berries are doing better. Raspberries are a good crop, but the berries are small. The Apple crop promises to be a good average one, but if rain does not fall shortly the fruits will be small. *Andrew McAndie, Ruthven House, Meikle.*

KINCARDINESHIRE.—The mild winter caused the earlier-flowering fruit trees to blossom in advance of the usual time, and Pears and Plums were caught by the frosts, although the later flowering trees escaped. The soil here is very light in texture, and the sub-soil gravelly. *John M. Brown, Blackhall Castle Gardens, Banchory.*

—Apples are plentiful, but they will be under an average size. Small fruits are good where the bushes are healthy. Strawberries promised well, but the berries were inferior owing to the drought. Peaches, Apricots and other tender sorts are not much cultivated in this district.

Our soil generally is of a light character. *John Scott, Banchory Lodge, Banchory.*

KINROSS-SHIRE.—The fruit crop in this locality gave good promise in the early part of the season, but the dry weather in June destroyed the prospects. The soil of these gardens is very light, and the subsoil is almost pure sand. *R. Fraser, Kinross House Gardens.*

LINLITHGOWSHIRE.—The fruit crops in these parts were very promising early in the season, but the dry weather spoiled the prospects. Gooseberries are not so good as usual this year, but Raspberries are a full crop. Red Currants are about an average quantity, but Black Currants are scarce. The soil here is a heavy loam, partly on clay and partly on rock. *Frank Henderson, Wallhouse Gardens, near Bathgate.*

MIDLOTHIAN.—I am surprised, considering the dry season, at the quantity of fruit, not only in this garden but in the neighbourhood in general. Apple trees, at the time of flowering, were a mass of blossom, and the fruits set in great clusters. But the trees experienced a long spell of dry weather, and the Apple crop was only just saved from complete failure by rain, amounting to half-an-inch, which fell on May 13 and 14. Much the same applies to the Pear and Plum crops, but as these trees blossomed earlier than Apples, they experienced a longer period of drought, and being principally wall trees, the fruits set very badly. Cherries, both early and late varieties, are a splendid crop. Peaches and Apricots were so numerous as to require thinning, and are looking well after the heavy rainfall of June 24, when 2.34 inches fell in 24 hours. Black Currants, Gooseberries and Raspberries are all plentiful, although Black Currants are rather small in size. Red Currants are a light crop on some bushes. Strawberries were fairly scorched up except where the soil seemed to be excessively deep, or where they had some shelter from bushes. The soil here is a rich, dark, deep loam and most suitable for all fruits. *Benjamin Ness, Oxenfoord Castle Gardens, Dalkeith.*

—The fruit crops are, on the whole, much below the average this season. Apples are only a moderate crop, Pears are scarce, and Plums few. Strawberries proved a good crop, and the berries were of fine quality, but they were soon over, owing to the dry weather. Small fruits, such as Currants, Gooseberries, Raspberries and Morello Cherries are satisfactory and of good quality. *D. Kidd, Carberry Tower Gardens, Musselburgh.*

—There was an almost entire absence of frost during April and May, and, the weather being dry, the conditions were extremely favourable to the setting of the fruits. Pear trees generally did not flower so freely as usual, and some very free bearing varieties, such as Beurré d'Amanlis, are bearing no fruit this season. The continuous drought of May and June, with north-east winds and very cold nights, has damaged the foliage of orchard Apple trees. *James Whytock, Dalkeith Gardens, Dalkeith.*

PERTSHIRE.—The crops of fruits in this locality are the best that we have had for many years, although want of rain, especially on our light soil may spoil the good prospects. *John Robb, Catherine Bank, Milnab Terrace, Crieff.*

—The long-continued drought has ruined the crops of small fruits. Many Plums and Pears have dropped in consequence of the exceptionally long period of dry weather. Apples only require a thorough soaking at the roots to ensure a splendid crop. Our soil is a heavy loam on a clay subsoil. *James Besant, Castle Huntley Gardens.*

6, SCOTLAND, W.

ARGYLLSHIRE.—Wall trees of Pears, Plums, and Cherries promised bountiful crops at the blossoming period, but the good prospects have not been realised. The drought in May and June may be responsible for the failure. Pears are a miserable crop. Black Currants dropped wholesale; there is, however, a fair crop of Red and White Currants. Gooseberries and Raspberries are very plentiful and of good quality. The Strawberry crop was disappointing; the one-year-old plants, particularly of Royal Sovereign, produced an excellent crop of fruits, but the

main crop of Strawberries in the open was spoiled by wet and cold. The variety Elton Pine may yet prove satisfactory. *D. S. Melville, Poltalloch Gardens, Lochgilphead.*

—Strawberries proved a splendid crop. Plums set well, but, owing to drought, the fruits dropped at the stoning period. Black Currants are very good, especially the variety Boskoop Giant. Many Gooseberries dropped owing to late frosts. *Alexander Macdonald, Castle Lachlan Gardens.*

AYRSHIRE.—Fruit trees of all kinds produced a wealth of blossoms, but late frosts and afterwards drought caused most of the fruits to drop. Strawberries proved much better than was expected early in the season. Raspberries also have been good. The soil here is of a close, retentive nature. The garden is at a low situation, and late frosts do much damage to the fruit crops. *William Priest, Eglinton Gardens, Kilwinning.*

—The fruit crops in this district are under an average quantity. A season that promised well has proved disappointing. The soil of these gardens is of a light nature and the subsoil is gravel. *D. Buchanan, Bargany Gardens, Dailly.*

BUTESHIRE.—The fruit crops generally in this district have been adversely affected by the continued dry, hot weather in June. The blossoms were injured by a continuous east wind. Gooseberries and Currants are both very good crops. Early Strawberries were of good quality, but the crop was a small one, although the later sorts were better. The soil is generally of fairly good quality, but light in texture, and this obtains all around the coast. *D. Halliday, Ascog Gardens, Bute.*

DUMBARTONSHIRE.—Although the dry weather has militated slightly against some fruits and birds have proved very destructive to the trees, the fruit crops in general are slightly over the average in this district. Small fruits are in abundance; early Strawberries suffered slightly, owing to the long spell of dry weather just as they were swelling, but late Strawberries are compensating for the early ones. Small Nuts are only an average crop, but Walnuts promise to be unusually plentiful. Our soil is of a very peaty nature, varying to a light, sandy loam. *Arthur Harwood, Ardarroch Gardens, Garelochhead.*

DUMFRIESHIRE.—Apricots promise to be of good quality. Plums and Cherries are scarce, but Strawberries were plentiful and good; indeed, all small fruit are satisfactory, especially Raspberries and Gooseberries on unpruned bushes. It has been observed here for many years that when Blackberries are extra fine, as they are this year, Damsons are a small crop. *John Urquhart, Hoddon Castle Gardens, Ecclefechan.*

—Apples are a good average crop; indeed, we have not had so many for ten or more years. Black and Red Currants are good average crops as a rule. Strawberries were an extra large crop of large, grand-quality fruits. Rain fell just in time to benefit the crop. The Strawberry foliage is very dense and healthy this season, which is very remarkable considering the dry weather. Our soil is a sandy loam. *James McDonald, Dryfeholm Gardens, Lockerbie.*

—The gardens here have been entirely planted with Apple trees grafted on the Paradise within the last 14 years, and they are now giving us splendid crops of fine, clean fruit. Pears do not do well in this locality, even when trained on walls. We can always rely on having splendid crops of fine fruit of Victoria Plums on wall trees. Strawberries were small in size and ripened quite two weeks in advance of former years. Currants and Raspberries are very fine crops. *David Inglis, Drumlanrig Castle Gardens, Thornhill.*

KIRKCUDBRIGHTSHIRE.—The fruit crops here are a fair average quantity, but Pears and Plums have dropped badly. Raspberries, Currants, and Gooseberries are all good crops, but the plants are suffering for want of rain. *James Deuchars, Kenmure Castle Gardens, New Galloway.*

—Apple and Plum trees gave promise of good crops early in the season, but the cold nights in May had a disastrous effect.

Strawberries have been very good; some berries weighing as much as 2½ ounces each have been gathered in this district. *J. C. D., Dildawn Gardens, Castle Douglas.*

LANARKSHIRE.—Fruit trees in these gardens made a great show of blossom, but as our soil is a sandy loam, resting on a sandy subsoil, the long-continued drought had an injurious effect on all the fruit crops. Cherries suffered most, and three parts of the fruits dropped. Strawberries promised well, but the rains came too late to save the crop. Gooseberries, Currants, and other small fruits are all good. *John Shiells, Carstairs Gardens, Carstairs Junction.*

(To be continued.)

PICKERING PARK, HULL.

In the issue for July 22, p. 52, we published a short account of the opening of the new public park at Hull by Mrs. Pickering, wife of Mr. Christopher Pickering, who has generously presented the ground for the use of his fellow townsmen.

sports, a considerable area is allotted to tennis courts, croquet lawns, bowling greens, and a childrens' playground, whilst 25 acres are reserved as playing fields. The almshouses are erected on either side of the main entrance, the wrought iron gates of which were supplied by Messrs. Thomas Brawn & Co., of Birmingham, at a cost of £1,000. On either side of the roadway, forming the chief avenue through the park, are varieties of Maples, whilst a little way to the left of this avenue is a series of lakes, crossed at two points by bridges, the one shown in fig. 42 having been designed by one of the students at the local School of Art. It is intended to furnish this "Japanese" bridge with climbing plants consisting chiefly of Roses.

As will be understood from the following brief account of the grounds a great deal of forethought has been expended on their design; with the result that few public parks are able to boast of greater variety than is exhibited by Pickering Park.

The pond is a great feature of the park, and

authorities steadily for the past three years, so that at the time when planting could be commenced from 40 to 50,000 plants were available, and many visitors find it difficult to believe that the garden only dates from February last.

The playing fields, which are some 25 acres in extent, are separated from the park by a sunken stone wall, and on the top of this wall is planted a hedge of massed Rambler Roses, which, when established and with their shoots hanging down to the water below, will form a pleasing feature. A sunken fence has been selected in order that visitors in the park may have an unrestricted view of the games in the sports ground.

It is intended to erect two conservatories with a pavilion in the centre, where refreshments will be obtainable. The flower garden and flowerbeds are planted with hardy perennials, Roses, flowering shrubs, and other permanent plants, so that summer bedding plants will not be largely needed. Many thousands of Narcissi, Tulips, and other bulbous plants have been planted in the grass. In order that visitors may obtain un-

FIG. 41.—PICKERING PARK, HULL: VIEW OF THE ROCK GARDEN.

It was in January, 1909—a time when some trouble was experienced by the Town Council in acquiring land for allotments—that Mr. Pickering first offered to make a gift of 30 acres for the purposes of a public park and to sell 20 acres for allotments, the purchase money of which should be devoted to the building and endowing of 12 almshouses and to the erection of entrance gates, and other appurtenances for the park. Later, believing that 50 acres would not be too much space for a public recreation ground to include extensive playing fields, Mr. Pickering offered to convey the whole of this area to the town free, and to make provision for allotments in another part of the borough. His generous offer was unanimously accepted by the authorities, and the gift was afterwards amplified by the addition of a strip of land on the eastern boundary, as well as by the presentation of a reading room and museum.

It being Mr. Pickering's wish that as much as possible of the grounds should be devoted to

has been skilfully constructed, for, whilst only a small part of it may be seen from any one point, some bold effects are produced. A stone shelter is surrounded by a dry stone wall to the water's edge, which is freely decorated with suitable plants, and at its base is a small bog garden containing Water Lilies, Irises, and other water-loving plants.

The rock garden covers an area of rather more than half an acre. It is built of Yorkshire stone, and already several thousands of plants have been arranged on it, including about 350 varieties of alpine and shrubs, each of which is labelled with the common and botanical names as well as the Natural Order to which it belongs. This garden has been constructed with the object of having masses of bloom for effect, and therefore ample space has been provided for planting big groups, but there are plenty of nooks and crannies in which smaller and rarer species of alpine may be planted. Provision for furnishing this garden had been made by the park's

interrupted views of the park only low fences of a light nature have been used, and then only where divisions are really necessary.

At the end of a terrace and near to the rock garden is a long, stone wall, which is already fairly well furnished with plants. On the top of the terrace is a border of perennials, with Roses, Cotoneasters, and other trailing shrubs hanging down the wall, whilst at the base is a flower border about 10 or 12 feet wide. This flower border is well filled with perennials and annuals, and these give a bright finish to the surroundings.

A wild garden, which is not yet completed, is entered by two pathways from the park, one leading from the stone bridge along the pond side and the other over the Japanese bridge. Including Pickering Park the city of Hull possesses no fewer than nine public parks and pleasure grounds, having a total area of over 224 acres. They are all under the care of Mr. H. B. Witty, the able superintendent.

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

INSECT PESTS.—The increased amount of labour occasioned in all the departments of the garden by the hot weather may have been the indirect cause of less attention than usual being paid to insect pests. If this has been so, do not lose any further time before taking measures to check them. The mealy bug thrives amazingly during the hot weather, and if its destruction is neglected it will give rise to an endless amount of trouble later. In the stove house this pest is partial to many plants, but to none more than to *Ixoras* and *Dipladenias*. In the case of *Ixoras* it is generally found amongst the trusses of blooms which, if badly infested, will be partially spoiled. The best remedy is to syringe with clean tepid water, applied not too vigorously. Mealy bug also infests the flower-trusses of *Dipladenias*: in this case a weak solution of methylated spirits applied by means of a soft

house or conservatory. The flowering of the plants will be prolonged considerably if the faded blossoms and seed vessels are removed promptly, as the side shoots will flower, if the energies of the plants are not concerned with seed formation. Strong, hardy specimens amply repay in extra flowering for any special attention bestowed upon them. Plants raised from seeds sown last spring should not be allowed to become starved in small pots. At about this date they should be well-established in 6-inch pots, and in a month's time they should be ready for transferring to 8-inch pots. The materials for potting should consist of good, fibrous loam, some well-decayed leaf-mould, and pulverised lime, or mortar rubble, which is preferable to silver sand. Pot firmly, and do not bury the crown of the plant below the soil. Stand the pots on a layer of ashes or cinders. Both the white and the blue sorts should be cultivated to provide variety.

CAMPANULA ISOPHYLLA, C. GARGANICA AND C. FRAGILIS.—These three species of *Campanula* are all suitable for pot culture, and they flower about this time. I prefer to raise the plants from cuttings rather than seed, and suitable shoots should be inserted as soon as possible after this date. They may be rooted easily in a cold frame having a north aspect.

fore, unless the showers are very copious, the watering must be attended to as usual during rainy weather.

EARLY VINES.—The vines which furnished the earliest bunches will be benefited by occasional syringings to rid the leaves of dust and red spider. The borders must not be allowed to become too dry, neither should they, at this season, receive an excess of water to cause them to become saturated. The lateral growths may, for a week or two, be allowed to extend at will, as this assists in keeping the buds at the base dormant. Endeavour to maintain the vinery, especially during hot weather, as cool as possible. Where the borders have become exhausted they should be thoroughly renovated. If this is done, the vines should not be subjected to hard forcing the following year. The work of adding new materials to the border should be taken in hand while the leaves are changing colour and before they fall. Before removing the old materials from the border the new compost should be got in readiness—a week or two in advance is preferable—and covered with mats to prevent evaporation. Commence by taking out a trench at the end of the border furthest from the canes, gradually working towards the latter with a fork, taking the greatest care of the roots, and never allowing them to be exposed to the air longer than is necessary. For this reason they should be kept well covered with damp mats, the roof of the house should be shaded, and the foliage syringed occasionally. The amount of new soil to be added will depend upon the condition of the border. See that the drainage is in good order. Over this place a layer of good turfy loam, grass-side downwards, and commence to fill in the trench with the new compost; at intervals a whole turf may be introduced. Carefully lay out the roots as the work proceeds, and make the soil thoroughly firm; take especial care, when nearing the surface, not to injure the fibrous roots, using soil in a finer condition. Give the border a watering to settle the compost, and cover with a mulching of manure. Keep the vines shaded for a few days, but admit an abundance of fresh air.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

PREPARATIONS FOR PLANTING.—Fruit trees intended for autumn planting should shortly be selected, and care should be taken to procure them from some reliable nurseryman. A few good varieties are far preferable to a great number, including untried sorts, and future success will depend largely upon procuring varieties suitable for the situation and natural soil of the district, items of importance which are often overlooked. The period of ripening, flavour, and long keeping qualities of the fruits, together with free cropping, and robust habit are some of the points to be considered by the planter when making his selection. The nurserymen's catalogues usually give particulars of the time of ripening and the keeping qualities of the fruits, and these should be studied. It is especially important to start with healthy trees, and the trees should be chosen during the summer months in the nursery, rejecting any that are attacked by canker or insect pest, or that show signs of gumming. Diseased trees would, in all probability, be the means of infecting other trees in the garden, and as prevention is always better than a cure, it is wise to avoid planting a tree which has a suspicious appearance of being diseased. In selecting the type of tree, the situation in which it will be planted must be taken into consideration. Fancy forms of training should be avoided, however fascinating or tempting they may appear to be. Espaliers, if well trained, either in fan-shape or horizontally, have a pleasing effect, and are useful in either the fruit or kitchen garden. The trees, if planted about 4 to 5 feet from the edge of the paths, according to the size of the garden, will form a hedge or screen to the vegetable crops. The narrow borders in front of the Espaliers may be planted with Strawberries or dwarf Cordon trees. Tall standards should never be introduced in a small garden, as these, when fully grown, cast too great a shade; neither should Espaliers in such cases be above 4 or 5 feet high, whilst half or dwarf standards should not be planted too closely together. In large gardens Espalier trees may be allowed to grow 6 or even 8 feet in

FIG. 42.—PICKERING PARK, HULL: THE PERGOLA BRIDGE.

(See p. 87.)

camel-hair brush will be found effectual in destroying the insect. By a judicious use of the syringe in places where insects are suspected of lurking, the mealy bug, thrip, and red spider may all be kept in check. Most trouble with insect pests in greenhouses and stoves is usually experienced with climbing plants that are trained to the roof or upright column. These need persistent attention at such times as the present. No insect, perhaps, is more troublesome in its attacks upon plants of the stove section of *Dracæna* than red spider, which may often be found in colonies even before its presence is suspected. In this case, frequent syringings with soot water, as advised in a previous Calendar for destroying red spider on *Codiaeums*, will be found effectual, except in extreme cases, when sponging with an insecticide must be resorted to. Much may be done to keep insects in check by fumigation or vaporising with a nicotine preparation. Any greenhouse plants in pots infested with the insects I have named should be taken into the open air and thoroughly syringed, first with clear water and afterwards with an insecticide. If precautionary measures were adopted frequently and regularly, rather than intermittently, insect pests would not give rise to so much trouble in glass-houses.

CAMPANULA PYRAMIDALIS.—Well-grown plants of *Campanula pyramidalis* are, at this season of the year, very useful in the cool green-

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

FIGS.—Permanent Fig trees growing in houses intended for furnishing a supply of fruits in the autumn must be kept growing steadily. Manure water should still be applied to the roots: the bare spaces of the house should be damped frequently, especially during hot weather, and the trees syringed vigorously. If the shoots are becoming too thick, it is advisable to thin out, wherever possible, some of the old wood, as the fruits require plenty of light to ripen perfectly. A few of the fruits also may be thinned where they are too numerous. Endeavour to keep the foliage clean and free from red spider and mealy bug. The latter is a most troublesome pest, and where trees are infested every means should be taken to combat it, especially when the trees are dormant in the winter months.

FIGS IN POTS.—Fig trees in pots have been extremely useful in supplying an occasional dish of fruits during the past few weeks. The trees will now benefit by being stood out-of-doors on a firm layer of cinder ashes in a sunny position. Continue to apply water to the roots as needed, and also syringe the plants occasionally. Rains are not always sufficient to thoroughly moisten the ball of soil about the roots of pot trees, there-

height, but 6 feet will give the best general effect. In planting this type of tree in an orchard or garden, choose a site which is sheltered from cold winds, but exposed to the direct rays of the sun. Fruit produced by Espaliers is generally supposed to be intermediate in quality, between that obtained from wall and standard trees. It is best to plant Espaliers from east to west, or in lines parallel to each other, at no less a distance apart than 12 or 15 feet, so that the trees in one row will not shade those in another.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

BULBOPHYLLUM AND CIRRHOPETALUM.—The flowers of these two genera of epiphytic Orchids are, in general, more curious than beautiful, and the plants are mostly cultivated as curiosities. The most attractive kinds include *Bulbophyllum barbigerrum*, *B. Careyanum*, *B. Lobbi*, *B. Ericssonii*, *B. virescens*, *B. reticulatum*, *B. longisepalum*, *Cirrhopetalum fascinator*, *C. Collettii*, *C. Amesianum*, *C. Micholitzii*, *C. Medusæ*, *C. ornatissimum*, and *C. picturatum*. The plants may be cultivated with little trouble, and the majority of them form good specimens. They should be grown in well-drained pans or teak-wood baskets filled with a mixture of chopped and well-mixed *Osmunda* fibre and moss in about equal parts, the plant being set in the centre upon a cone of this material. The best time to afford fresh compost is when the young growths are developing new roots, but root disturbance should not take place unless the condition of the compost renders this necessary. The plants grow best when suspended near to the roof, or they may be stood on a stage close to the glass. They need plenty of light, but should be shaded from excessive sunshine. An abundance of moisture should be given the roots during the growing season, and at no period should the compost be kept entirely dry. In the season of active growth, a warm, moist atmosphere should be maintained in the plant house. During the winter the plants may be removed to the intermediate house, but on no account should they be subjected to low temperatures or continuous drought.

STANHOPEA.—*Stanhopea* is another genus of epiphytic Orchids, many of the species having beautiful, perfumed flowers. Although the blossoms are very gorgeous and make a showy display, they last only a short time in perfection, hence *Stanhopeas* do not find much favour with the majority of Orchid growers. The plants are easily cultivated, and are very free in blooming. On account of the pendulous character of the scapes, the plants are best grown in teak-wood baskets, so that the flower spikes may push their way through the divisions of the wood-work and hang downward. The receptacles should be well drained, and a compost similar to that advised for *Bulbophyllums* and *Cirrhopetalums* may be employed as a rooting medium. *Stanhopeas* thrive well suspended from the roof at the warmest end of the Cattleya house; they require an abundance of water at the roots whilst growing actively. Although a clear light is beneficial, very bright sunshine injures the foliage, and the syringe must be used daily over and under the leaves in order to keep down attacks of red-spider and other insect pests. After growth is finished, the plants should be allowed a long period of rest in a lower temperature, and water sufficient only to keep the pseudo-bulbs from shrivelling.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

THE DROUGHT.—The dry weather has seriously delayed the planting of winter crops and, in many cases, rendered the operation almost impossible. Those who mulched their summer crops will be amply repaid in finer vegetables for the extra labour incurred. Mulching is of great advantage to summer vegetable crops, and should be practised in every garden where time and material are available. Whilst dry weather lasts the garden should be cleared of all crops which are over and the ground prepared for planting Coleworts or some other crop which will be cleared in time for it to be prepared for such vegetables as early Potatoes.

CAULIFLOWERS.—The plants should receive liberal supplies of clear water, as few other garden crops suffer so much from the effects of dry weather as Cauliflowers. The watering should, as far as possible, be done in the evening, or very early in the morning, and a thorough soaking should be given. The varieties *Early London* and *Walcheren* may still be planted. Select rich ground in a sheltered part of the garden. Do not allow the plants to become stunted through want of water. The ground for this plantation should be stirred frequently with the hoe to lessen the evaporation of moisture.

FRENCH BEANS.—French Beans should be planted in pits having sashes that may be removed, for these will not be needed until the approach of frost, which usually occurs in September or October. Beans intended for an autumn supply should be allowed plenty of room between the rows so that the light and air may enter freely amongst the plants. Overcrowding is a mistake at all times, but it is more detrimental in the autumn than in the spring. Varieties suitable for sowing at the present time include *Ne Plus Ultra*, *The Belfast* and *Canadian Wonder*, which, if given plenty of room, is still one of the best varieties for a general use. Earth up the latest plantations of Beans in the open garden as soon as the plants are a few inches high, to prevent them from being damaged by autumn winds. The plants will be benefited by syringings in the evenings of hot, sunny days, also by liberal applications of water at the roots during dry weather.

SPRING CABBAGE.—A second sowing of Cabbage should be made without delay. Choose an exposed site in order that the plants may grow as hardy as possible. Sow in shallow drills drawn 1 foot apart, and cover the bed with netting to protect the seed from birds: if the drills are saturated with water the night before the seeds are sown, germination will take place quickly. There are many good varieties of spring Cabbage, but *Harbinger*, *Flower of Spring*, *Ellam's Early*, and *Offenham* are amongst the most reliable sorts for autumn sowing.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

SEED GATHERING.—The seeds of *Eremuri*, *Fritillarias* (Crown Imperials), various *Irises*, *Hemerocallis*, *Lupins*, *Delphiniums*, and many other plants are now ripe, or approaching maturity, and should be gathered before the seed vessels burst. Even if they are not fully ripened when gathered, the seeds, if laid out to dry, will ripen perfectly. Single-flowered *Hollyhocks*, which are blooming profusely this season, vary considerably in the colour of the flowers, and seeds should be gathered from the finer sorts only, taking care to select none but the earliest-ripened capsules, as these are less likely to contain insect hybridised seeds than those which ripen late. It is usually preferable to sow seeds of the above-mentioned plants soon after the seeds are ripened, rather than to delay doing so till the spring. These seeds, as a rule, do not germinate till they have been wintered in the soil, therefore, if they are sown now, a season will be saved.

GODETIA.—This annual has long been popular in gardens, and noteworthy on account of the great variety in the colour of the flowers. Probably all the older varieties have been eclipsed by *Schaminii* fl. pl., sometimes known as *Sutton's Double Rose*, which I have cultivated with much pleasure during the past four or five years. The flowers of this kind are a delicate shade of pink, and the beds at Tynninghame in which they are planted promise this year to be the finest in the garden. Other varieties differing in colour have been distributed by the nurserymen, and of these a very charming form is *Sutton's Double Mauve*. The colour is much the same as that of the Common Mallow, and will especially appeal to those who delight in what are termed art shades. It is equally if not more robust than *Schaminii*, of which it is apparently a colour sport. In habit, it is quite distinct from those of which *Lady Albemarle* is a type, the flowers being disposed on long, slender stems in the way of *G. rubicunda*.

SWEET PEAS.—Sweet Peas have been forming seed-pods in great numbers during the past

week, and the removal of these has become a necessity. If flowers are not specially wanted, it is worth while to pick them as well as the pods, as this will rest the energies of the plants, and enable them to overcome the tendency to form pods. The haulm is growing very fast, and unless very tall sticks have been inserted, it will be necessary to introduce tall stakes—*Larch* poles, with the bark on, are suitable—and stretch string or, better still, wires from pole to pole at suitable heights. The variety *Dazzler* was recently mentioned in the *Gardeners' Chronicle* on account of its glowing colour; but *Thomas Stevenson* is even finer, and eclipses all of the well-known gorgeous type. Messrs. Dobbie distributed for trial seeds of a variety with double standards. This proves to be a fine selection of the pink and apricot varieties, the names of which are so numerous. The weather has been very trying for Sweet Peas, as well as for many other flowers, but seldom have the colours been so well defined.

GENERAL WORK.—The budding of *Roses* should be finished at the earliest moment, and the later growths of *Carnations* layered as soon as convenient. Where gravel paths are hoed, the hoe should be used to kill any seedling weeds which are apt to appear about this date. The grass at the edges of verges and flower-beds will for some weeks to come grow more rapidly than hitherto, and will need cutting at short intervals. Train in young shoots of climbers before they get twisted and irrecoverably bent: the older shoots may be removed entirely where this can be done without it being noticeable.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

OLD MANURE BEDS.—All inter-crops grown between Celery and Cauliflowers must now be marketed, as the Celery and Cauliflowers require the additional room. Carrots should be thinned, wherever possible, in order to promote a sturdy growth. When some of the beds are cleared of their crops they should be broken up to provide a supply of black soil for the early sowings in autumn.

MELONS.—The Melon crops will require little attention beyond watering the last batches, where the fruits are still swelling, and the picking and packing of the fruits. Where cloches have been employed for covering Melons, frames and lights may be substituted, as there are now plenty of these available.

CUCUMBERS.—Fruits are now plentiful and must be cut at least three times weekly, as they soon turn a yellow colour. As the roots have now reached the manure, watering need not be done so frequently. Ventilation should be afforded day and night, but the lights must never be removed, as the young fruits are liable to damp off in chilly weather.

AUTUMN CROPS.—The ground selected for growing the transplanted Endive should be lightly dug. Whenever convenient, preferably in rainy weather, the plants should be set out in rows at a distance of 1 foot apart each way. It is not too late to make a further planting of Celery, and this may be necessary as the drought has somewhat injured the earlier batches.

CHICORY.—The oldest leaves of *Witloof Chicory* should be broken away by the hand. A watering fortnightly with liquid manure will be beneficial to the growth of the plants.

SPINACH.—A sowing of Spinach should be made in drills drawn 1 foot apart. *Viroflay Giant* is a good variety for winter use. The seeds should be inserted in three batches, allowing a fortnight to elapse between each sowing. This practice will not only secure a succession, but be a safeguard against failure, as often the plants of the first batch damp off in mild winters.

SPRING ONIONS.—The main crop of Spring Onions should be sown in well-drained soil. The seeds should be sown broadcast and covered with a good mulching of decayed manure.

STRAWBERRIES.—The runners should now be set in a richly-manured bed at a distance of 18 inches apart. These runners will form the plants for forcing in 1913. The advantage of this method is that blind plants may be detected and destroyed at the following flowering season.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 5—Killarney Sweet Pea Show. Soc. Française d'Hort. de Londres meet.

MONDAY, AUGUST 7—Bank Holiday. Swanage Fl. Sh.

TUESDAY, AUGUST 8—Leicester Fl. Sh. (2 days). Knaresborough and District Fl. Sh. Clevedon Fl. Sh. (2 days).

WEDNESDAY, AUGUST 9—Brecon Fl. Sh.

THURSDAY, AUGUST 10—Taunton Deane Fl. Sh. Soc. Nationale d'Hort. de France (Paris) Exh. Prendergast Fl. Sh. at Haverfordwest. Border Sweet Pea Soc. Sh. at Coldstream.

SATURDAY, AUGUST 12—Green and District Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.3°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 2 (6 P.M.): Max. 79°; Min. 59°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 3 (10 A.M.): Bar. 30.2°; Temp. 72°; Weather—Overcast.

PROVINCES.—Wednesday, August 2: Max 76° Cambridge; Min. 56° Ireland S.W.

A Horticultural Museum.

All concerned in the advancement of horticulture will agree that a well-planned and equipped horticultural museum would be of the greatest value. The organisation of such a museum would, it is true, be a matter of no small difficulty. It would require ample space and the application of the best methods for the preservation and display of specimens. More than this, it would need a not-inconsiderable endowment, and also zealous oversight, lest it should become a sort of horticultural curiosity shop in which all sorts of things, good, bad and indifferent, were stored with magpie-like indiscriminateness. Though the difficulties are great, they are not insuperable, and the advantages that would be derived from good collections of cultivated plants—illustrating their time, place, and mode of origin, their range of variation, and method of propagation—would be extraordinarily instructive. We can imagine nothing which would be more calculated to give a great impetus to scientific horticulture, nor nothing which would be of so much service to the investigator. The shows of the Royal Horticultural Society provide in this country, it is true, the best of all museums. But, by the nature of the case, they are transitory, and the permanent records of horticultural progress—records in which intermediate stages are dis-

played at one and the same moment to the eye—are, at present, but fragmentary. As in Nature we see but the last phases of progressive development of living things in those which flourish to-day, and needs must dig in the earth to find traces of the forms of life of the past, so we see admirably displayed at the nurseryman's and florist's establishments, at the great shows, and in private gardens, the latest products of the horticulturist's skill, but must turn to the columns of horticultural journals to get, at best, but an imperfect idea of the stages by which these present, proved results have been produced.

This age has realised, under the stimulus of Darwin's teaching, that it is one of the foremost duties of mankind to record its own progress, and to preserve such of the past records as are extant. That this should be done, accords with modern views that one generation is the trustee of the succeeding generations, and owes to the future the debt of preserving a record of this present.

The horticultural museum we contemplate—a counsel of perfection perhaps—is not so much one in which pathological specimens are preserved, noxious insects, fungi and the like—these things could be, and to some extent are, dealt with in local institutions. It is rather the function of a great central museum, such as we have in mind, to display the progress and change which have overtaken, and are overtaking, cultivated plants.

Anyone who has attempted to form a mental picture of the course of evolution of any of our cultivated plants knows how difficult is the task. The raiser of a given race of plants knows much, often far more than appears in the books, but much of this knowledge perishes with him—"and all the rest forget for which he toiled." Descriptions and drawings, such as we possess, help to fill the gaps in our knowledge; but how much more thoroughly might these gaps be filled if we could preserve the actual specimens with something of their individual form and colour! The material difficulties of preserving true colours of flowers are not overwhelmingly great—at least in many cases. By drying in sawdust or sand, at moderately high temperatures, and also by other methods, it is possible to preserve, for example, the yellow of the Crocus, the blue and red colours of Salvias, and some, at all events, of the many tints of the Chinese Primrose. Moreover, we have now at our command processes of colour photography which give admirably faithful pictures of natural objects, and this art would serve to supplement the natural specimens.

Here, in the foundation of a horticultural museum, the pious benefactor has an opportunity to do a notable service to horticulture and also to biological science; and, having regard to the way in which projects, seemingly remote from realisation or even visionary, have of getting themselves carried into effect, we do not despair of the realisation of the idea of such a horticultural museum as we have indicated.

R.H.S. SCHOOL OF HORTICULTURE AT WISLEY.—The next two years course will commence on September 25. There are six vacancies, and intending students are requested to communicate with the Secretary of the Society, R.H.S. Hall, Vincent Square, Westminster, S.W., as quickly as possible. Young men between 16 and 22 years of age are eligible. The only payment to the Society is five guineas as an entrance fee. W. Wilks, Secretary.

THE "DAILY MAIL" SWEET PEA COMPETITION.—As is generally known the proprietors of the *Daily Mail* offered in the spring of this year £1,000 for the best bunch of Sweet Peas, to consist of 12 spikes, not fewer than four varieties. A 2nd prize of £100, a 3rd of £50, 100 silver medals, and 900 bronze medals were also offered. Such a prize as £1,000 for a single bunch of flowers is, it is needless to say, unprecedented in the annals of horticulture—not for its magnitude only, but also for the comparatively simple and easily-grown nature of the exhibit required. The result was that entries approaching 40,000 were received. The competition was decided on Friday last, and the flowers had all to reach the Crystal Palace by parcel post. This condition, which seemed a hard one to many, placed competitors on a footing approaching equality. The plan adopted as to judging was as follows. The boxes were delivered by the postal authorities to a marquee erected for the purpose. The boxes were opened by a number of boy scouts, and examined at once by a small committee of judges, who decided if the flowers were fit to go forward. Thousands of the bunches were dried up, or much too small to be considered, whilst many more were not in conformity with requirements. Only 12 spikes were to be sent; some forwarded only three or four; others as many as 100; whilst several sent bunches of one variety only. The result of this preliminary examination was that some 10,000 bunches were brought to the notice of the 10 judges. These gentlemen commenced work at 8 a.m. on Friday, and, working in pairs, selected the best from each table. One hundred and three bunches were in this way picked out and put on a separate table. From this lot the first three were chosen, and the final decision was arrived at by a vote of 6 to 4, the 1st prize of £1,000 being awarded to Mrs. FRASER, The Manse, Sprouston, Kelso; the 2nd prize of £100 to Mr. H. W. RICHARDS, Ryde, Isle of Wight; and the 3rd prize of £50 to Rev. D. D. FRASER, The Manse, Sprouston, Kelso. The flowers which were awarded the 1st prize were large, and bore evidence of excellent culture. Moreover, they were all four-bloom sprays, the stalks being about 16 inches long. John Ingman, Mrs. Hugh Dickson, Arthur Unwin, King Edward Spencer, and a dark sort, like Nubian or Tom Bolton, were the varieties. Those to which the 2nd prize was awarded had not the same length of stem as the 1st, and several of the spikes had only three flowers. The judges were Messrs. THOMAS STEVENSON, ANDREW IRELAND, A. G. STARK, SILAS COLE, J. GOATLEY, J. H. MILLARD, W. P. WRIGHT, HORACE WRIGHT, CHARLES CURTIS, and HARRY FOSTER. Those voting in the majority comprised all the practical growers. Lord NORTHCLIFFE and his colleagues are to be congratulated on creating by this exhibition such keen and intense interest in Sweet Pea culture. Mr. BEECH THOMAS has been responsible for most of the arrangements in connection with the competition, and he discharged his heavy task most efficiently.

CARDIFF FLOWER SHOW.—We are informed that the award of a Silver-gilt Medal made to Messrs. ED. WEBB & SONS' exhibit at the Cardiff Show was subsequently altered by the committee to a Gold Medal.

FRUIT CROPS IN GERMANY, FRANCE, AND BELGIUM.—The Board of Agriculture and Fisheries have received the following reports from His Majesty's Consuls on the condition of the fruit crops in certain districts in Germany, France and Belgium.

In the Pomeranian district of Germany the prospects of the Plum crop are not favourable; the crop is estimated to be below the average, with a probable yield of 30,000 to 40,000 cwts.

were sent to Hull via Hamburg in 1910 and the preceding years.

In the Hamburg district a large crop of early Pears is expected, but late Pears promise only a medium crop.

In North Germany there is no prospect of a very heavy crop of Apples, and in Austria there is only a small harvest, while in Holland and Italy there is a probability of heavy crops. A rich and plentiful crop of early Plums is ex-

In Brandenburg Plums suffered from the effects of frost and also from insects, and the crop is expected to be small. In Silesia Plums have done well, with the exception of Greengages and Mirabelles. In the province of Saxony Plums of all kinds promise to be a good crop. Peaches and Apricots are fairly good in Brandenburg, below the average in Silesia, and good in the province of Saxony.

The fruit harvest throughout Germany is expected, according to present conditions, to be rather better than the average.

Reports from France show that Plums will give a very abundant yield in all parts. Apples are plentiful, Pears promise an abundant crop, Nuts are abundant, Cherries fairly abundant, Peaches promise only half an average yield, and Apricots are very scarce.

In the Honfleur district Plums are a very small crop, especially Greengages. Dessert Pears promise only a quarter of the usual crop, but Apples are plentiful, and all kinds of Nuts are abundant.

Regarding Belgium, Apples in the provinces of Brabant, Hainaut and Limbourg are generally scarce. In the provinces of Liège, Namur and Luxembourg the unusual heat in the early part of May had a prejudicial effect, except in the valley of the Meuse, where the crop will be an abundant one. In the provinces of Antwerp and the two Flanders the prospects of a good crop are favourable. In the provinces of Liège, Namur and Luxembourg Pears are fairly plentiful, and in most districts the crop will be above the average. In the provinces of Brabant, Hainaut and Limbourg Plums are plentiful, but the trees are attacked by aphis, and the crops will consequently suffer. In the valley of the Meuse Plums are plentiful, but elsewhere in the provinces of Liège, Namur and Luxembourg the crops will be about average. In the provinces of Antwerp and the two Flanders the Plum trees are well laden, and the prospects are good.

EUCALYPTUS.—Mr. J. H. MAIDEN'S *Critical Revision of the Genus Eucalyptus*, of which the first part was issued in 1903, has reached the 12th part and the 59th species. The species described and figured in Part XII. are *E. Raveretiana*, *E. crebra*, *E. Staigeriana*, *E. melanophloia*, *E. pruinosa*, *E. Smithii*, *E. Naudiniana*, *E. sideroxylon*, *E. leucoxylon*, and *E. Caleyi*. As we have said before, in notices of previous parts, Mr. MAIDEN has spared himself no trouble in pursuing his investigations to all possible limits, and in this part he clears up all doubts respecting the presence of a species of *Eucalyptus* in the Philippine Islands, and its identity. He had previously contributed the particulars of this discovery to the *Proceedings of the U.S. National Museum*, vol. xxvi.; but as that publication is not generally accessible, the facts may be repeated here. Mr. WILLIAM RICH, a botanist attached to WILKES'S U.S. Expedition, collected in Mindanao imperfect specimens of a tree which he named *Eucalyptus multiflora* (a name previously employed in the genus), and A. GRAY, in the *Botany of the Expedition*, published the name, with such description as he could give. Mr. MAIDEN has been able to examine the specimen, and has identified it with *E. Naudiniana*, F. Muell, a species otherwise only known to occur in New Pomerania (New Britain), in the Bismarck Archipelago, where it is abundant. Mr. MAIDEN has received further—though not perfect—specimens from Mindanao, and it is highly interesting to have the record of this Australian element in the Philippine flora confirmed. Our latest news of Mr. MAIDEN is that he was slowly recovering from a severe surgical operation. We hope that he is by now completely restored to health and able to resume his valuable studies.

[Photograph by John Gregory.]

FIG. 43.—MUSSAENDA ERYTHROPHYLLA: FLOWERS PALE YELLOW WITH CRIMSON DISC: THE ENLARGED SEPAL CARMINE VERMILION.
(R.H.S. Award of Merit on Tuesday last, see p. 95.)

The prospects of the Plum crop in Silesia are good. The Pear crop is estimated to be about one-quarter below the average yield. The crop of Apples will be poor; it is estimated that about 30,000 cwts. will be placed on the market. An average crop of Bilberries is reported. These, although gathered near Stettin, are forwarded to Hamburg for shipment, and large quantities

pected, but only a good medium crop of late Plums.

In the Berlin district Apples and Pears are expected to be below the average in Brandenburg and Silesia, and considerably below in the province of Saxony. An average crop of Plums is expected on the whole, though Greengages and Mirabelles will be somewhat less than usual.

THE KING OF BULGARIA AND PLANT COLLECTORS.—While on a recent tour in the Balkans, Mr. C. F. BALL, of Glasnevin Botanic Gardens, and Mr. HERBERT COWLEY, of *The Garden*, were presented to His Majesty the King of BULGARIA, who placed at their disposal a special railway carriage for travelling throughout the country and guides to accompany them over mountainous districts. Some interesting plants were collected on the Rhodope Alps and in the neighbourhood of the Shipka Pass, and these have been sent to the Glasnevin Botanic Gardens. When crossing the Shipka Pass the party discovered large masses of *Haberlea rhodopensis* flowering profusely on shady banks. We are informed that among other plants noted were *Dianthus microlepis* and its pure white variety, *Primula minima*, *P. frondosa*, *P. deorum*, *Lilium Martagon*, *Pinus Peuke*, *Saxifraga sancta*, and other species. *Gentiana asclepiadea*, *G. lutea* and *G. verna*, *Soldanella pusilla*, *S. montana*, *Aquilegia aureum*, *Geum coccineum*, and *Campanula velutina*.

THE MUSTARD BEETLE.—The Board of Agriculture and Fisheries have received information that the Mustard beetle (*Phædon betulæ*) is doing much damage in some districts this season. They desire therefore to direct attention to measures which may be adopted to combat this pest. The beetles hibernate in various sheltered places, such as the Mustard stubble, in the hollow stems of other plants, in the neighbourhood of the food plants, and in crevices of many kinds. Eggs are laid in spring and summer, and both grubs and beetles feed on the growing plants. Pupation of the grubs takes place in the soil. The beetles may be attacked (a) by dislodging and trapping them by dragging tarred sacking over the young plants when the beetles are observed upon them; and (b) by spraying the infested crop with arsenate of lead, which may be obtained ready for use in the paste form, and may be employed at the rate of 4 lbs. of the paste to 100 gallons of water. It has been observed that later in the year the beetles at times migrate in great numbers to other fields, and when this takes place a shallow trench should be dug across the path of the migrating swarm. If the trench is kept tarred many beetles will be caught, notwithstanding the fact that they have wings. After infestation the stubble may be burnt over before ploughing in order to destroy hibernating beetles.

EARLY FRUIT AND VEGETABLES FROM ITALY.

—According to the *Journal* of the Royal Society of Arts, efforts are being made by shippers in Naples and Palermo to obtain a subvention from the Italian Government, in order to establish a line of quick steamers from Naples, touching at Palermo, to London. These steamers, which would be specially designed for the conveyance of early fruit and vegetables from Southern Italy and Sicily for the London market, would be provided with every convenience for the rapid loading and discharge of their cargoes, and for carrying them to their destination in perfect condition.

THE LOGANIACEÆ OF ASIA.—Under the title "Contribution à l'étude des Loganiacées Asiatiques de l'Herbier du Muséum de Paris," Professor PAUL DOP (*Bull. Soc. Bot., France*, 4me series vol. x.) describes a number of new species mostly from Eastern Asia. They include eight species of *Strychnos*, mostly collected and named in manuscript by the late Dr. PIERRE. Professor Dop classifies the species in three groups, having short, intermediate or long-tubed corollas. *S. Gaultheriana*, Pierre, from Tonking, is used as a remedy in cases of plague, and other species are said to be used medicinally, though

no particulars are given. Professor Dop still records *Buddleia curviflora* from Japan, although, as explained in the *Gardeners' Chronicle*, May 11, 1889, p. 595, and elsewhere, the Japanese plant is a very distinct species, to which the name *japonica* has been given. The genuine *B. curviflora* is only known from the Luchu Archipelago, is not in cultivation, and is only represented in British Herbaria, so far as we know, by the original specimen collected by BEECHY and preserved in the Kew Herbarium. There are several seminal varieties in cultivation recorded as the issue of *B. japonica* (*B. curviflora*, Hort.), among them *B. carnea* (*Revue Horticole*, 1879, p. 90, with a coloured plate), which is represented with lilac rather than flesh-coloured flowers.

THE NEW ZEALAND FLORA.—Mr. T. F. CHEESEMAN, the author of the excellent *Manual of the New Zealand Flora*, which appeared in 1906, continues to publish from time to time additions to the flora, both in new species and extension of areas. Among new species are *Olearia pachyphylla*, *Raoulia Gibbsii*, and *Myosotis Astonii*. The discovery of *Leucopogon Richei* on the mainland of New Zealand is interesting. This species has a very wide range in littoral districts in Australia, occurring in all the states of the Commonwealth, and is also present in the Chatham Islands. It was the only Australian plant inhabiting the group that had previously not been met with on the mainland of the Dominion. Mr. CHEESEMAN figures two additional examples of branched trees of the Nikau Palm, *Rhopalostylis sapida*, one with three branches, one with four, in each case springing almost from the same point. Branched specimens of this Palm are, apparently, not very rare. The most remarkable specimen known is one with 11 branches, figured in the *Transactions of the New Zealand Institute*, vol. x., t. 15.

PUBLICATIONS RECEIVED.—*The Women's Agricultural and Horticultural International Union Leaflet*. (July.) Price 2d. (London: 64, Lower Sloane Street.)—*Flower Show Fixtures for 1911*, by Austin & McAslan, 89, Mitchell Street, Glasgow. Free on application.—*Journal of The National Poultry Organization Society, Ltd.* (July.) 6d. (London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd., 23, Paternoster Row, E.C.)

THE ROSARY.

ROSA HEMISPHERICA.

THE interesting note from Mr. W. H. Divers on p. 418 regarding this species and its behaviour in dry weather appears to me to be correct, at least so far as my limited experience with this Rose extends. My plant has received a severe check from the recent excessive drought and has failed to flower, although earlier in the season it looked very promising, and was in splendid health. The plant in my possession seems to be quite at home on a light sandy loam, and although only planted in November last year it has made good growth. I am much interested in all the yellow species of Roses, and have no fewer than 16 of these under observation. I note Mr. Divers says that no other Rose has such a beautiful golden-yellow colour as *R. hemisphærica*, and I am very anxious to see its flowers on that account. My object in collecting every known species of yellow Rose is two-fold. In the first place, I believe some of them will prove of immense value for breeding purposes, and the second reason is this: Some years ago, in a very old garden in East Lothian, at one time the site of a church under the monks of ancient Newbattle Abbey, I discovered a brilliant yellow single Rose of great beauty. It has been submitted, on several occasions, to eminent and ex-

perienced Rosarians, but none of them can name it. In foliage it closely resembles *R. pimpinellifolia lutea*, but it is a stronger grower and much deeper in colour in the flowers, which are also considerably larger than those of that variety. Everyone who has seen it is struck with its glorious colour, and I wish to identify it if possible, hence my second reason for growing all the yellow species known to cultivation. Mr. Divers says that, on the authority of Nicholson, *R. hemisphærica* is probably one of our oldest varieties, as it was introduced from the Orient in 1629. I am inclined to doubt Nicholson on this point, as I find him at variance with facts on several matters in connection with the species of Roses. As an example, he says that *R. Ecæ*, the single yellow Rose of Afghanistan, is synonymous with *R. xanthina*. I find these totally different in flower, foliage, and habit. Then, again, as to *R. hemisphærica*, while Nicholson says it was introduced in 1629, I find it stated on the authority of Professor Crépin, of Brussels, that it was introduced by Hermann in 1762. No doubt the oldest known single yellow Roses we have are *R. lutea* (Austrian yellow), and *R. lutea bicolor* (Austrian copper), both of which were mentioned by Gerard in 1596. In the admirable system of the classification of Roses adopted by Professor Crépin, I observe that he brings *R. hemisphærica* under the section "*Luteæ*," this including all the Austrian briars. This eminent authority also considers *R. hemisphærica* as synonymous with *R. sulphurea* of Aiton (1789), and there is also a double form of this Rose. I have not flowered this form yet, and am unable to say anything as to its merits, but in habit and foliage it resembles the single in every detail. Under Crépin's section "*Pimpinellifoliæ*," which includes all the Pimpernell Roses, and of which our Scotch Burnet Roses are typical examples, there is also a Rose named *Sulphurea*. It is, however, quite distinct in every way from the species of that name under the Austrian briar section in the above noted scheme of classification, but I have not seen its flowers, although I hope to have it sufficiently established to yield these in abundance another season. *R. hemisphærica* is a native of Persia and Armenia, and seems strongly allied to the Austrian briars. One of the prettiest species in the garden, both in foliage and spines, is *R. hispida* (syn. *lutescens*). Even though the flowers are worthless, which I hope will not prove to be the case, the plant would be valuable for its charming foliage. *Geo. M. Taylor, Mid-Lothian.*

ORLEANS ROSE.

THIS, one of the newest of dwarf Polyantha Roses, was seen by the writer in its native country in large plantations of half an acre or more, and no words can give an idea of the magnificent effect of colour which the plants produced. A bright pink with a suggestion of salmon, foliage light green and very healthy, and, lastly, it does not fade "blue" but white. *Wanderer.*

GARDEN PENTSTEMONS.

THE somewhat comprehensive genus *Pentstemon* contains many beautiful and interesting species suitable for garden purposes. In addition to those employed in the herbaceous border, there are the florists' varieties which have emanated mainly from such species as *P. Cobæa* and *P. Hartwegii*. Apart from their origin, however, this group contains some very fine varieties, and where attention is paid to their cultivation they are capable of producing a fine display. Taken as a whole, the *Pentstemons* are of comparatively easy culture, though one point deserves more than a passing word, and this is the provision of a sufficient depth of good, rich soil. It is unfortunately a rather common occurrence to find some of the most beautiful species struggling for existence in hot, dry positions

that are, to say the least, ill suited to their well-being. Frequently, in the winter, the plants are severely tried by the climatic conditions, and when rains and frosts succeed each other day by day they may be killed outright; for this reason the whole of the stock should not be risked out-of-doors without protection. Frequently, however, plants that have been badly damaged by wet and cold in the winter will, provided a little leaf-mould has been placed over the roots, break quite strongly into growth in the spring, and make as good a show as ever. Inasmuch, however, as the severity or changeableness of a winter is beyond speculation, it will

value pertaining to these Pentstemons as a whole, they are not only very profuse in their flowering, but where a good selection of the species exists, together with an assortment of the florists' bedding kinds, our gardens may be brightened with them from June till October, and even later when severe frosts are absent. In order to ensure ordinary success with the plants thorough drainage of the soil is of primary importance, and these, in common with numbers of other Californian plants, suffer more from excessive moisture at the roots than from the coldness of our winters. When grown as rock plants it must be remembered that they need a richer treatment

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE HORTICULTURAL TRADES AND THE LAND UNION.—Dissatisfaction amongst horticulturists has been growing for some time past with regard to the additional burdens thrown upon the trade by recent legislation. It is now realised that Undeveloped Land Duty on the difference between the agricultural value and the hypothetical value of the land, for building or for any other purposes, although levied at one half-penny in the £ on such difference in the capital value, represents in effect a tax of nearly 1s. in the £ on the rental value. The feeling of uneasiness has been greatly intensified by the sympathetic reception given recently by the Prime Minister and the Chancellor of the Exchequer to a petition signed by 172 members of Parliament, urging that increased taxation should be thrown upon land values to the extent of many millions of pounds a year. The matter has now culminated in the formation of a special committee of those interested in horticulture, with a view to securing redress and resisting further impositions. The list of members comprises such well-known names as G. Bunyard, W. Bull, R. Copley, H. E. Honnor, Geo. Monro, R. Piper, C. E. Pearson, S. Pickering, T. A. Rivers, J. Rochford, W. B. Randall, E. Sherwood, H. J. Veitch, J. G. Veitch, N. Sherwood, H. Morgan Veitch, A. Watkins, W. Poupart, Wm. Sams, B. Hurst, J. Sweet, H. O. Larsen, E. Rochford, R. W. Wallace and W. R. Pennell. Arrangements have been completed by this committee securing the assistance of the Land Union with its organisation of 140 branches throughout the country. Those anxious to support the committee by contributing to the campaign fund, or by offering their personal assistance as speakers or canvassers, should communicate with the Secretary, Horticultural Advisory Committee, Land Union, St. Stephen's House, Westminster, London. C. H. Kenderdine, Secretary of the Land Union.

THE DESTRUCTION OF CHARLOCK.—On this estate spraying for the destruction of Charlock has been practised with very gratifying success for several years past, and if W. P. R. were to give Strawson's preparation a trial, according to directions given, he would admit the efficacy of it. I myself saw the benefits of it, when first tried on a field of Corn here some years ago, and spraying has been practised annually with conspicuous success. One convincing point as to its merits is that the tenant farmers on this estate have taken up the spraying since it was first tried on the home farm, and these practical farmers do not waste money or time on worthless methods. As with Mr. Molyneux, Charlock is a pest in this locality. Some 10 years ago, a railway embankment was formed here, and this is usually a mass of golden Charlock during early summer, but none is seen in the cornfield adjoining, and this is due entirely to annual sprayings. Wilmot H. Gates, Rotherfield Park Gardens, Alton, Hants.

RED SPIDER ATTACKING VINES.—I have read with interest the remarks of your correspondents on this subject. I agree with Mr. Thatcher (see p. 7) that vine borders, especially at the surface, are kept much too dry during the early part of the season. In all my experience I have never had a vinery attacked with red spider. During my six years' service at Euston Hall, Thetford, under the veteran grower Mr. Low, we had three vineries, two built of iron and one of wood. The two former were difficult to manage during the early part of the season, as the temperature quickly became very high through the sun's rays, necessitating constant attention to ventilating. Mr. Low was a great advocate of having every inch of ground well moistened with water about mid-day. At closing time the bare spaces were damped again, which made it impossible for red spider to gain a footing. I have seen the pipes sulphured to check red spider, but I am of the opinion that excessive fire-heat and a dry atmosphere are the causes of this pest appearing. If the parts near to the hot-water pipes are not damped, red spider will soon travel up the vine rods. E. Hart, Brockley House, Twyford, Winchester.

[Photograph by Wyndham Fitzherbert.]

FIG. 44.—PENTSTEMON CAMPANULATUS (WHITE VARIETY).

be best to keep a reserve of at least all the rarer and more tender kinds under glass.

Seeds of several of the species are easily obtained, and these, if sown as soon as they are ripe, will germinate freely. Plants are also easily raised from cuttings inserted in sandy soil in a frame or under a handlight about August, when suitable pieces of the half-ripened shoots root readily. Plants raised in this manner will, if kept in a cold house or frame through the winter, flower well in the following year. It is worthy of note, and the fact is perhaps insufficiently recognised, that, apart from the general

than Alpines, and constant moisture at the roots, which is generally best secured by burying large stones around them. The plants enjoy a full exposure to sunlight.

According to Nicholson's *Dictionary of Gardening*, *Pentstemon campanulatus* bears flowers varying in shades of pink, dark purple, and violet. I have two plants which were given me a few years ago by Canon Ellacombe, of Bitton. One has flowers of a rich crimson and the other, which is shown in fig. 44, is pure white. *P. campanulatus* is a native of Mexico. Wyndham Fitzherbert.

NEW SYSTEM OF WATERING PLANTS OUT-OF-DOORS.—During the recent dry weather I have extended the scope of an experiment I made on a small scale last year. My garden is on the slope of a hill, on the sandy heath of Dorsetshire, but I have succeeded in growing excellent Roses, flowering shrubs, and a variety of creepers on my pergolas, including an assortment of vines. I do not allow unused flower-pots to lumber my potting shed, but sink them in the ground to a depth of 4 inches, and, when possible, at about 8 inches to the south of the stem of the plant, as being the direction in which the roots run, but above all the plants or shrubs on sloping ground, so that the water gravitates to the roots. In my Rose-bed I place one 8½-inch pot to four or six or more Roses, according to their size. By this system the work of watering is done very quickly, the effect is far more lasting, and water is not wasted. Throughout all this dry weather I have not lost one single plant. *A Lover of Roses.*

THUNDERSTORM AT KILKENNY CASTLE.—A violent thunderstorm, accompanied by a gale of wind and unusually heavy rains was experienced here on Saturday, July 29. The rainfall between the hours of 4.30 p.m. and 7 p.m. amounted to 2.14 inches, and for the 24 hours to 2.21 inches, which is the heaviest fall recorded here in one day since the meteorological records were first kept in 1884. Fortunately, no serious damage was done to the crops. *E. Sutton, The Gardens, Kilkenny Castle.*

ROSE BILLARD ET BARRÉ.—Mr. Chester Parker, on p. 62, states that this Rose has been in cultivation for over 20 years, and is still less popular than it ought to be. He has made an error in the date, for the variety was sent out by Pernet Ducher in 1898, and was offered in catalogues in England a year afterwards. As it would be a year or two later before it was under general cultivation, 10 years would be more accurate than the period stated by Mr. Parker. It is never likely to become a popular Rose, and has long been superseded by other and better varieties. Your correspondent recommends it as a standard or half-standard, but, as Billard et Barré is pre-eminently a pillar Rose, it is not a desirable standard variety in any form; indeed, when such sorts as Mrs. Peter Blair and Harry Kirk are available, it need not be considered. As a climber, its flowering habit is against it, and Mme. Hector Leuillot is superior in every way. Billard et Barré has a bad habit of throwing three blooms to the truss, the centre one being withered and over before the two side ones are showing colour. *Geo. M. Taylor, Midlothian.*

THE FLOWERS OF CHAUCER.—I have read with interest Canon Ellacombe's remarks on the flowers of Chaucer. It may be of interest to state that growing in the pleasure grounds here is an old Oak with the following lines attached to it:—"Lo the Oke, that hath so long a nourishing Fro' the time that it ginneth first to spring, And hath so long a life, as we may see, Yet at the last wasted is the tree." *Chaucer.* No doubt the tree was an old one in Chaucer's time, as it appears to be many hundreds of years old. It is in a slanting position and so hollow that one may easily get inside. The tree on one side appears to be dead, whilst the other side is quite green and fresh. About 4 feet from the ground the trunk measures 16 feet in circumference. *Frank Spillard, Parham Park Gardens, Pulborough.*

EUROPEAN NURSERY CONDITIONS (see p. 46).—Referring to the extract from the *Farmers' Bulletin* (U.S.A.), I may say my association has been in communication and had a deputation before the Board of Agriculture on the subject of nursery inspection. We were unable to make arrangements for a regular inspection of nurseries on the lines laid down in the American Quarantine Bill, the chief difficulty in the way being that of the expense, but I think that no difficulty will be experienced by those firms which regularly trade with the U.S.A., as the Board has in these cases, where it has been properly applied to, sent down one of its own inspectors to go through the nursery and give the necessary certificate, when the conditions justified its issue. *Chas. E. Pearson, Secretary of the Horticultural Traders' Association of Great Britain and Ireland.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 1.—The usual fortnightly meeting was held on Tuesday last in the Society's hall, Vincent Square, Westminster. The exhibition was one of the smallest of the year, and the attendance also was meagre.

Orchids were well represented, and included the best exhibit at the meeting, a group of *Disa grandiflora* shown by Mrs. BISCHOFFSHEIM. Two Awards of Merit were granted by the ORCHID COMMITTEE, and Mr. ALEXANDER received a Cultural Commendation for a magnificent specimen of *Phalænopsis violacea*.

The FLORAL COMMITTEE granted five Awards of Merit. The principal groups in this section were of Phloxes, Delphiniums, Ferns, Gladioli, Cannas, and Gloxinias.

Exhibits before the FRUIT AND VEGETABLE COMMITTEE were unimportant, but they included some magnificent yellow Tomatos, shown by Mr. BECKETT, for which a Cultural Commendation was awarded. Potato "Arduthie Early" received an Award of Merit after trial at Wisley.

Floral Committee.

Present: Messrs. W. Marshall and H. B. May (Chairmen); and Messrs. W. Bain, C. T. Druery, John Green, G. Reuthe, Wm. J. James, J. W. Barr, W. J. Bean, C. Blick, Wm. Howe, J. F. McLeod, John Dickson, Chas. Dixon, W. Cuthbertson, Chas. E. Shea, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, E. A. Bowles, Geo. Gordon, J. Jennings, Jas. Hudson, T. W. Turner, Walter T. Ware, and Arthur Turner.

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, arranged a semi-circular group of the herbaceous *Thalictrum dipterocarpum* on the ground and a collection of Cannas with standard *Plumbagos*, *Begonia Lucerna*, *Mimosa pudica*, *Exacum macranthum*, *Schubertia grandiflora*, *Solanum Wendlandii*, *Paullinia thalictifolia*, &c., on tabling. The Cannas included Oscar Dannecker, R. Wallace, Duke Ernst, J. B. van der Schoot, and Terra Cotta. The vigour of the beautiful blue *Thalictrums*, some of which were 10 feet high, was astonishing. In their Chinese home the plants attain a height of about 6 feet. The graceful habit and delicate colouring of the flowers places the species in the front rank of summer-flowering hardy herbaceous plants. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, staged a collection of Ferns with batches of *Campanula isophylla* *superba*, *alba* and *Mayi* and *Cissus discolor*. The best of the Ferns were the varieties of *Davallia tenuifolia*, including *Burkei* (especially vigorous and good), *Veitchii* and *stricta*. Other interesting Ferns were *Adiantum micropinnulum*, *Todea barbara*, *Adiantum Veitchianum*, *Blechnum corcovadense* and *Lomaria discolor*. (Silver Flora Medal.)

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), in addition to two new Chinese shrubs, both of which secured Awards of Merit, exhibited a collection of 48 varieties of bedding *Verbenas*. Most of the varieties shown were of French origin, but the best was the one named after Miss Willmott. Other good sorts were *Rubis*, *King of Scarlet*, *A. de Lord* (blue), and some unnamed red seedlings.

Messrs. JAMES CARTER & Co., Raynes Park, erected a circular, raised group of *Gloxinias*. The plants had fine flowers, with a wide range of colour, and were raised from seed sown on January 3 last. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, showed a collection of Cannas, relieved with plants of *Asparagus Sprengeri* and *Grevillea robusta*. The most showy varieties of Cannas included *Mephisto* (crimson), *President Meyer* (scarlet), *Garam* (cardinal, especially good), *J. Uhl* and *H. von Otrante* (yellow), *Frau Daisy Hultzsch* and *Betsy Ross* (rose), *Hesperide* and *Carl Cropp* (orange), and *J. B. van der Schoot* and *R. Wallace* (spotted). (Silver Banksian Medal.)

The TULLY NURSERY Co., Kildare, Ireland, displayed one of the largest and most decorative groups of flowers in their collection of Gladioli, which were arranged in batches of salmon, scarlet and salmon-pink and blue varieties. (Silver Flora Medal.)

Messrs. H. HOMAN & SONS, Noordwijk, Holland, staged a collection of Gladioli, mostly of *gandavensis* and *Childsii* varieties, but with a few of the *Lemoinei* type. The spikes were not large, but the blossoms exhibited unusual clearness and range of colour. *Bronze King*, *Prince of Orange*, *Snow Queen*, *Primrose Queen*, *Yellow Gem*, *Glory of Noordwijk* and *Dream*, with some unnamed white seedlings are a selection of the best varieties.

Mr. G. KOIZUMI, 35, Bessborough Gardens, London, arranged an interesting collection of dwarf Japanese Conifers.

Messrs. WEBB & BRAND, The Nurseries, Saffron Walden, showed a collection of named double Hollyhocks on show boards and as cut spikes in vases. The collection showed uniform excellence, but among the more distinct varieties may be mentioned *Amaranth*, *Salmon Queen*, *Olive Chater* (pink), *Bullion*, *Miss Lizzie King* (yellow), *Primrose Queen*, *Apple Blossom*, *alba superba*, *Siena* (white), *Joy* (rose-pink) and *Ruby Queen*. (Bronze Flora Medal.)

Messrs. PAUL & SON, The Old Nurseries, Chessington, staged a collection of Phloxes, but they soon withered in the great heat. *Eugene Danzanvilliers*, *Etna*, *Iris*, *La Neige*, *Le Mahdi* and *Siebold* were conspicuous varieties.

Mr. J. BOX, Lindfield Nurseries, Sussex, showed a good collection of Phloxes, which were in a fresher condition than other exhibits of this subject. Dr. Königshofer was a new brilliant scarlet variety. General van Hentz and Baron von Dedem were fine salmon-rose varieties. Lindfield Beauty, both for quality and colour, was the best pink sort; it is better known as *Elizabeth Campbell*. The finest white varieties were *Frau Ant. Buchner* and *Friefraulein von Lassberg*. A few Gladioli were also shown by this firm, including the soft pink *America*, which was effectively staged with *Prunus Pissardii*, and Baron Hulot and other blue *Lemoinei* hybrids, *Delphiniums Moerheimii*, *Persimmon* and *Lamar-tin* were also shown well. (Silver Flora Medal.)

Mr. G. REUTHE, Keston, Kent, staged an interesting and varied collection of hardy-flowering plants. Some of the less commonly-seen specimens were *Rhododendron chrysanthum*, *Eucryphia pinnatifolia*, *Lilium philadelphicum*, *Desfontainea spinosa*, *Dryas lanata*, *Mazus Pumilio*, *Phygelius capensis*, *Tamarix hispida*, *astivalis* and *Gentiana thibetica*. A batch of grey-leaved plants included *Alopecurus lanatus*, *Achillea argentea*, *A. Kelleri*, *Anthemis cinerea*, *Inula candida*, *Salvia candidissima* and *Artemisia stellaria*. (Bronze Flora Medal.)

Messrs. T. S. WARE, Ltd., Feltham, Middlesex, staged a large and showy group of border plants, with a few Alpines in pots. The more interesting plants included *Agapanthus umbellatus*, and its white variety, *Liatris spicata*, *Sedum maximum purpureum*, *Zauschneria californica*, *Origanum pulchellum*, *O. hybridum*, *Nierembergia rivularis* and varieties of *Aconitum* and *Helianthus*. (Bronze Flora Medal.)

Messrs. BAKER'S, Wolverhampton, showed a small but effective batch of *Tunica saxifraga alba plena*, which received an Award of Merit in August, 1909.

AWARDS OF MERIT.

Canna Terra-cotta.—A handsome variety, with very large trusses and smooth petals. The colour is a rich clear orange. Shown by Messrs. JAS. VEITCH & SONS, LTD., Chelsea.

Carnation Mrs. Wharton.—A vigorous-growing border variety. The flowers are full and possess non-bursting calyces, but are deficient in scent. The colour is a rich shade of apricot. Shown by Mr. J. R. BATTY, Skelton Castle, Yorks.

Cornus paucinervis (see fig. 45).—A Chinese dwarf, bushy evergreen, hardy shrub, introduced by Mr. E. H. Wilson and shown as a pot plant 18 inches high but attaining to a height of 5 or 6 feet. The leaves are lanceolate, short stalked, about 2 inches in length and ½ inch in breadth, smooth, but with a number of inconspicuous adpressed hairs. The flowers are creamy-white and occur in numerous flat clusters terminating the branches, the whole corymb being about 3 inches in diameter, and the closely-packed individual flowers ½ inch or less. The plant is described as a new Chinese species in the *Journal of Botany* for 1881.

Itea ilicifolia (see fig. 46).—Another interesting Chinese shrub, raised by Mr. Beckett three years ago from seed sent by Mr. E. H. Wilson. The glossy, leathery leaves, their dark colour, spiny margins and short reddish stalks are all suggestive of the common Holly, but the plant is allied to the Escallonias and gains distinction from its curious pendulous racemes of small greenish flowers. The inflorescence is about 6 inches long and $\frac{1}{2}$ inch in diameter, cylindrical, with the densely-placed flowers which individually are not more than $\frac{1}{4}$ inch across. In China, Mr. Wilson found the shrub growing in full exposure in stony ravines. One of the seedlings has thrived out-of-doors so far at Elstree, and it is hoped that it will prove quite hardy. Both

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Gurney Wilson, J. Charlesworth, Stuart Low, F. J. Hanbury, C. H. Curtis, W. Cobb, W. H. Hatcher, J. E. Shill, A. Dye, H. G. Alexander, W. H. White, J. Wilson Potter, and W. Bolton.

One of the most beautiful and remarkable exhibits of Orchids shown this season was seen in the very fine group of *Disa grandiflora* shown by Mrs. BISCHOFFSHEIM, The Warren House, Stanmore, for which a Silver-gilt Flora Medal was awarded and a Cultural Commendation to the grower, Mr. Taylor. The group extended about 35 ft., and was composed of splendidly-grown plants, bearing together over 120 spikes

the very distinct *Catasetum Cliftonii* (see Awards), the pretty red *Dendrobium arachnites*, a fine tuft of the rare Philippine *Bulbophyllum laxiflorum* with many heads of the singular white flowers, *Cirrhopetalum pulchrum*, *C. lepidum*, four plants of the yellow *Spathoglottis Fortunei*, *Dendrobium ciliatum*, the handsomely-variegated *Eulophia maculata*, the dwarf orange-coloured *Lælia monophylla* bearing 12 flowers, *Cycnoches chlorochilon*, and *Zygopetalum Roeblingianum*.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a group of splendidly-grown Orchids. Amongst the more noticeable were *Odontioda Ernest Henry* var. *Fairlawn* (O. Queen Alexandra \times C. Noezliana), with pretty chestnut-red

FIG 45.—*CORNUS PAUCINERVIS*: FLOWERS CREAMY-WHITE.
(See R.H.S. Awards of Merit, p. 94.)

[Photograph by John Gregory.]

these were shown by Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett).

Mussaenda erythrophylla (see fig. 43).—A Rubiaceous stove plant from tropical Africa, as shown, pruned to a bushy shrub, but occasionally in its native habitat climbing to 30-40 feet. The flowers are tubular, with a spreading disc, pale yellow, centred with crimson, and very fleeting. The plant owes its name and chief interest to the occasional abnormal development of one of the sepals into a large carmine-vermilion blade, very pale beneath, 3-4 inches in length and cordate in shape. The unfolded corolla, the calyx and flower-stalks are densely covered with crimson hairs, and a red sap suffuses the principal veins and hairs of the leaves, giving the plant a curious distinction. Shown by Messrs. JAS. VEITCH & SONS, Chelsea.

of brilliant scarlet and carmine-red flowers, varying much in tint, but all large and showy, the bright-green leaves at the base being in a perfect condition.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), again showed a well-flowered plant of *Lælia Bella* (majalis \times purpurata), with large, rosy-lilac flowers; also the rare *Catasetum apterum*, and the small, pretty *Eria mysorensis*, bearing white flowers with purple and yellow labellums.

Baron BRUNO SCHRÖDER, The Dell, Egham (Orchid grower, Mr. J. E. Shill), showed a fine plant of the white *Mormodes luxata eburnea*, which thrives admirably in the *Cattleya* house at The Dell.

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park (gr. Mr. Collier), staged an interesting group, in which were several good specimens of

flowers, showing the golden-yellow ground colour in the lip; *Odontoglossum Lambeauanum* var. G. E. Day, a charming, pure-white variety, with light-violet markings; *Cattleya Elvina* Herbert Goodson, a bright-rose flower, with a deep, claret-crimson-coloured lip; *Sophro-Lælio-Cattleya Elissa*, with showy copper-red flowers; and other pretty hybrids. The centre was composed of fine plants of *Cattleya Warscewiczii*, among which a specimen of the white-petalled variety *Frau Melanie Beyrodt* had one of the best flowers yet shown. Others noted were a fine plant of *Cattleya Gaskelliana alba* carrying seven flowers, *Cattleya Rex*, *Anguloa eburnea*, various *Odontoglossums*, including *O. ardentissimum* xanthotes; *Cypripedium Lawrenceanum* Hyea-num, *C. callosum* Sanderæ, and *C. Maudiae*.

E. H. DAVIDSON, Esq., Borlases, Twyford (gr. Mr. F. Cooper), showed a pretty hybrid between

Cattleya granulosa and *C. Gaskelliana*, and *C. Bievreana* (*Gaskelliana alba* × *Schilleriana*), of a delicate blush-white, with purple veining on the lip.

The Rev. J. CROMBLEHOLME, Clayton-le-Moors, Accrington, showed *Cypripedium Ossulstonii* Crombleholme's variety, a fine, greenish flower, with a snow-white dorsal sepal.

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. J. M. Black), showed a group of pretty hybrids, including a number of specimens of the mauve-tinted *Odontioda Thwaitesii*, the pretty *O. Wilsonii* (white, with violet spotting), and four plants of the large-flowered and handsome *Laelio-Cattleya Rubens*.

W. JAMES, Esq., West Dean Park, Chichester (gr. Mr. W. H. Smith), was awarded a Bronze Banksian Medal for a small group of scarlet *Disa grandiflora*, the plants being well flowered.

group, in the centre of which was a selection of their fine forms of *Cattleya Warscewiczii* of the *Sanderiana* type, varying in tint, but all large and fine in shape. In addition to these there were well-grown plants of *Cattleya Dowiana*, *C. Rex*, various hybrid *Cattleyas*, including *C. Bievreana*, *Cypripedium Neptune* and other hybrids of *C. Rothschildianum*, the fine green and white-flowered *C. Rosettii*, *Bulbophyllum densiflorum* and other species of botanical interest, and the rose and white-flowered *Dendrobium Regium*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, showed *Cypripedium Franconii* (*callo-Rothschildianum* × *callosum Sanderæ*), a very large hybrid with long and broad petals spotted with chocolate colour. They also exhibited two other showy hybrid *Cypripediums*.

Mr. E. V. Low, Vale Bridge, Caywards Heath,

trilobed form of the labellum, and all exhibit a very large and prominent, raised, triangular, orange-coloured callus. The colour of the flowers varies from greenish to pale yellow, and the lip is slightly fimbriated.

Both Sir JEREMIAH COLMAN and Sir TREVOR LAWRENCE showed forms of this species at the meeting of June 20, and the award on this occasion carries with it a similar award to the plant shown then by Sir TREVOR LAWRENCE.

CULTURAL COMMENDATION

to Mr. H. G. Alexander, Orchid grower to Lieut.-Col. Sir GEORGE L. HOLFORD, for a magnificent plant of *Phalænopsis violaceæ*, the largest leaf being about 1 foot long and 8 inches broad; of a deep-green colour. The plant bore two flower-spikes, the blooms being white, with violet marking on the inner parts.

Fruit and Vegetable Committee.

Present: A. R. Pearson, Esq (in the Chair); and Messrs. J. Cheal, C. G. A. Nix, W. Bates, A. Dean, W. Pope, J. Willard, E. Beckett, J. Harrison, G. Wythes, H. Markham, and A. R. Allan.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), showed two dishes of very fine yellow Tomatos, named Golden Glow. The Committee recommended a Cultural Commendation.

Dr. J. WALKER, of Wimbledon, exhibited a Cucumber fruit 9 inches long, bearing on its point a small flower.

Messrs. LAXTON BROS., Bedford, showed a seedling Plum, the result of crossing Early Orleans with Early Yellow. The fruits were not fully ripe, and resembled small fruits of the variety Victoria. With them were a few fruits of Rivers's Early Prolific, to show that the seedling ripened earlier.

From various sources came seedling Brambles or hybrid Raspberries, with black and red fruits. As crosses of the Loganberry and Raspberry are now very numerous, the Committee invited the Council to arrange a trial at Wisley of all the varieties obtainable.

AWARD OF MERIT.

Potato "*Arduthie Early*."—The variety was grown under trial at Wisley, and cooked tubers were placed before the Committee for judging the eating qualities. The tubers were of the Ashleaf Kidney form, the flesh being unusually yellow, and was both dry—and pleasant—flavoured. From Mr. SMITH, Arduthie.

WISLEY TRIALS.

A Sub-committee of the Fruit Committee visited Wisley recently and made the following recommendations for Awards, which were approved by the Fruit Committee on July 18 and confirmed by the Council.

AWARDS OF MERIT.

King's Acre Berry (KING'S ACRE NURSERY Co., Hereford), (Peas) *America*, *The Caithness* (these two from Mr. HOLMES, High Street, Tain), *Eureka*, *King Edward*, *Matchless Marrowfat* (these three from Messrs. SUTTON & SONS, Reading), *Bell's Premier* (Messrs. BELL & BIERSTEDT, Leith), and *The Cottager* (Mr. S. YATES, Manchester).

A Sub-committee of the Floral Committee met at Wisley on July 14, and made the following recommendations for Awards, which were approved by the Floral Committee on July 18, and forwarded to the Council, who granted the same.

AWARDS OF MERIT.

Sweet Peas Helen Pierce, *Marie Corelli*, *Nubian*, and *Queen of Spain Spencer* (all from Messrs. DOBBIE & Co., Edinburgh).

The following varieties were highly commended for garden decoration: *Aurora Spencer*, *Princess Victoria* (Award of Merit, July 9, 1907), *Ivanhoe* (Award of Merit, June 21, 1910), *Elsie Herbert* (Award of Merit, July 9, 1907), *Dorothy Eckford* (Award of Merit, September 2, 1902), *Gladys Unwin*, *Isobel Malcolm*, Mrs. Collier, *Lady Althorp*, *Asta Ohn*, *Etta Dyke*, *Elfrida Pearson* (Award of Merit, July 19, 1910), *Apple Blossom Spencer*, *Tennant Spencer*, *Dobbie's Sunproof Crimson* (Award of Merit, June 21, 1910), and *Countess Spencer* (true). W. Wilks, Secretary.

FIG. 46.—*ITEA ILICIFOLIA*: FLOWERS GREENISH-YELLOW.
(See Awards of Merit, p. 95.)

[Photograph by John Gregory.]

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Banksian Medal for an effective group of choice Orchids, amongst the best being their new *Oncidioda Charlesworthii*, with four tall spikes of rosy-mauve flowers; *Mormodes luxata punctata*, having white flowers with purple-spotted centres; the best form of the white *Anguloa eburnea*, with several large blooms; choice forms of *Laelio-Cattleya callistoglossa*, *Bollea celestis*, *Cattleya Warscewiczii*, *Cirrhaea viridi-purpurea*, *Odontoglossum Othello*, and other *Odontoglossums*.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Banksian Medal for an effective

staged a group containing a very handsome and darkly-coloured form of *Cattleya Hardyana*, two plants of *C. Lord Rothschild*, some good specimens of *C. Gaskelliana alba*, also hybrid *Cattleyas* and *Cypripedium Fairrie-Maudiae*.

AWARDS.

AWARD OF MERIT.

Catasetum Cliftonii, from Sir JEREMIAH COLMAN, Bart., V.M.H. (gr. Mr. Collier).—The flowers bear in some of the forms a strong resemblance to those of *C. Bungerothii*, but there are remarkable departures, showing a distinctly

LEAMINGTON AND COUNTY
HORTICULTURAL.

JULY 26-27.—Notwithstanding the very hot, dry weather experienced during the present summer, the third annual flower show, held in the Victoria Park, Leamington, on the above dates, was a pronounced success. Although Roses, Sweet Peas, and hardy herbaceous flowers showed the effects of the long-continued drought, indoor fruit, plant groups and honorary exhibits were praiseworthy.

A comprehensive schedule was provided, no fewer than 160 classes being included. Seven silver challenge cups, valued at 150 guineas, together with liberal cash prizes, were offered, also gold and silver medals. On the opening day of the show a presentation was made to Alderman Holt, J.P. (Deputy Mayor), in recognition of the very great services which he has rendered to the town during the three successive years of his mayoralty. Alderman Holt is the founder and chairman of the Leamington and County Flower Show, and the society's present satisfactory condition is largely due to his tact, perseverance and plodding industry. He is also vice-chairman of the Warwickshire County Committee, working in association with the Royal International Horticultural Exhibition to be held in London next year. The presentation was made by the Mayor (Dr. H. Mason), and it took the form of an order for his portrait to be painted in oil colours. Mrs. Holt was the recipient of an aquamarine necklet set in diamonds and also a silver tea kettle.

PLANTS (OPEN CLASSES).

The principal class in this section was for a group of plants arranged on a ground space of 20 feet by 12 feet. There were three splendid exhibits. The 1st prize of £20 was won by Messrs. JAMES CYPHER & SONS, Cheltenham, whose group was remarkable for the great diversity of richly-coloured *Codæums*, *Dracænas*, and profusely-flowered *Orchids*. A rustic arch, clothed with graceful foliage and flowering plants, was the central feature, and in the body of the group *Codæums*, *Caladiums*, *Alocasias*, *Aralias*, *Orchids*, *Ferns*, *Ixoras* and tall specimens of *Humea elegans* were artistically arranged. Sir GEORGE H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), was placed 2nd with a beautifully-arranged group, somewhat similarly composed to that of Messrs. CYPHER; 3rd, Mr. W. VAUSE, Leamington.

Messrs. JAMES CYPHER & SONS led in a class for 12 stove and greenhouse plants, of which not fewer than four were to be in flower, in pots not exceeding 10 inches diameter. This exhibit included well-grown plants of *Chironia ixifera*, *Ixora Pilgrimii*, *I. regina*, *Clerodendron Balfourii*, *Dracæna Albertii*, and *Codæum Thompsonii*. 2nd, Mr. W. VAUSE.

Five good exhibits were shown in the class provided for three specimen *Fuchsias*. The 1st prize was gained by J. MURRAY-MOLESWORTH, Esq., Comyn Lodge, Leamington (gr. Mr. S. Bradshaw), whose specimens were very large, well-trained, and profusely flowered. The same exhibitor also showed the best half-dozen tuberous-rooted *Begonias*. His plants were uncommonly well grown and carried an abundance of large, shapely, stout-petalled flowers. The 2nd award went to W. E. MASTERS, Esq., of Warwick. Mrs. RAYSON, Newstead House, Leamington (gr. Mr. W. Jones), won 1st prizes in classes for (1) three *Coleus* plants, (2) six *Gloxinias*, and (3) three *Zonal Pelargoniums*. The well-trained *Coleuses* were beautifully coloured, and both the *Gloxinias* and *Zonal Pelargoniums* were well covered with flowers. Some very handsome table plants were exhibited by Messrs. W. PEMBERTON & SON, Bloxwich, Walsall, who beat seven competitors in a class for six plants. 2nd, Mr. W. VAUSE. J. H. BURLEY, Esq., Brandon Parade, Leamington (gr. Mr. H. J. Finch), showed the best three *Ferns*, having well-cultivated specimens of *Nephrolepis*, *Adiantum*, and an *Asplenium*. The best plant in flower was an *Epacris*, shown by Mr. W. VAUSE. 2nd, Alderman HOLT, Leamington (gr. Mr. J. Fisher), with a rather small but well-flowered plant of *Bougainvillea*. *Cycas revoluta*, exhibited by C. C. SHAW, Esq., Leamington, was pronounced the winning specimen in a class reserved for one foliage plant.

ROSES (OPEN).

Although Roses were not very extensively shown, many of the blooms were of great merit. The most important class was for a decorative exhibit of Roses, arranged on tabling of 12 feet by 4 feet. There were three exhibits. The Silver Challenge Cup, value 25 guineas, offered as 1st prize by J. F. Shaw, Esq., was won by Messrs. GUNN & SONS, Olton, Birmingham, whose flowers were effectively displayed in vases and Bamboo stands. Tall pillars decorated with Dorothy Perkins and Hiawatha formed a very pretty background, and such varieties as the Lyon Rose, Mrs. John Laing, Frau Karl Druschki, Captain Hayward, Richmond, and Melanie Soupert were seen to advantage near the front of the group. The 2nd prize was awarded to Mr. J. MATTOCK, New Headington, Oxford, who had a well-arranged collection of good varieties. 3rd, Mr. GEORGE PRINCE, Longworth, Faringdon, Berks. The last-named exhibitor beat four contestants in a class for 24 blooms, distinct. He showed excellent specimens of Maman Cochet, White Maman Cochet, Bessie Brown, Jonkheer J. L. Mock, Dean Hole, and Gladys Harkness. 2nd, Messrs. CHAPMAN & COLIN, Leicester, whose blooms of Bessie Brown, Mildred Grant, and White Maman Cochet were meritorious. 3rd, Messrs. HICKS, Wallingford, Berks.

Messrs. PERKINS & SONS, Coventry, took the lead in a class for 12 Hybrid Perpetuals. Their best flowers were Mme. Eugene Verdier, Horace Vernet, and Frau Karl Druschki. The same exhibitors were awarded the 1st prize in a class for six H.P.'s (one variety). They showed *Gloire de Chedane Guinoisseau* in beautifully fresh condition.

The best 12 Tea Roses were shown by Mr. GEORGE PRINCE, who also had the winning stand of six Tea Roses (one variety).

HARDY HERBACEOUS AND OTHER FLOWERS.

The quality of the flowers exhibited in the principal class, which was for 25 distinct kinds of hardy herbaceous flowers, was below that of a year ago, when several very fine exhibits were made. The leading award, consisting of a Silver Challenge Cup, value 25 guineas, presented by F. A. Chandler, Esq., was won by Messrs. GUNN & SONS, who had a tastefully-arranged collection, which included large bunches of *Phloxes*, *Scabious*, *Campanulas*, *Hollyhocks*, *Centaureas*, *Liatris spicata*, and *Chelone barbata*. F. BOUSKELL, Esq., Nuneaton, was placed 2nd with good examples of *Gaillardias*, *Delphiniums*, *Catananche cœrulea*, and *Eryngium amethystinum*. 3rd, Messrs. T. B. GROVE & SON, Sutton Coldfield.

The winning stand of 12 distinct kinds of hardy herbaceous flowers was exhibited by Mr. C. H. HERBERT, Acocks Green, Birmingham, whose examples of *Gaillardias*, *Alstromerias*, and *Scabious* were particularly good. 2nd, Messrs. F. SMITH & CO., Woodbridge.

Mr. W. HARPER, Leamington, won 1st prizes in classes for (1) bouquet for the hand, (2) bridal bouquet, (3) three sprays suitable for a lady, and (4) six bunches of stove and greenhouse flowers, dissimilar. Messrs. PERKINS & SONS, of Coventry, were placed 2nd in the first two classes.

There were only two entries in a class for undressed *Carnations*, shown with their own foliage and buds; ties or bands around the calyx or paper collars were prohibited. Table space of 8 feet by 4 feet was allotted to each exhibitor. The 1st prize of 5 guineas was secured by Mr. A. F. DUTTON, Iver, Bucks., who had flowers of Pink and White Enchantress, Victory, Winsor, and others, pleasingly arranged. The 2nd award fell to Messrs. YOUNG & CO., Cheltenham, who showed bold masses of the leading varieties.

The same two exhibitors were placed in the order named in the next class, which was for a dozen vases of *Carnations*, in not fewer than six varieties, each vase to contain at least six flowers.

Messrs. A. R. BROWN, LTD., King's Norton, and Mr. C. H. HERBERT, Acocks Green, were awarded 1st and 2nd prizes respectively in classes for (1) 12 border *Carnations*, dissimilar, and (2) 12 *Carnations*, dissimilar.

SWEET PEAS.

A Silver Challenge Cup, value 20 guineas, presented by Alderman Holt, was offered for the best exhibit of Sweet Peas to occupy a space of 80

square feet. There were two exhibits. The 1st prize was won by Mr. T. Cross, Bury St. Edmunds, who had good-quality flowers, in great variety. 2nd, Messrs. GUNN & SONS, Olton.

Robert Sydenham Limited offered prizes for nine distinct varieties of Sweet Peas. 1st, Mr. A. TAYLOR, Olton; 2nd, Mr. J. RANDALL, Leamington.

Messrs. Webb and Sons' prizes were offered for eight varieties, and here again Mr. A. TAYLOR took the lead, the Rev. J. J. AGAR ELLIS being placed 2nd.

Mr. Henry Eckford's prizes were offered for nine varieties, Mr. I. W. LAMPLOUGH, Leamington, and Mrs. ROGERS, Leamington, winning the 1st and 2nd prizes respectively.

PLANTS AND CUT FLOWERS.

It was very gratifying to observe the increased number of entrants in the group-class arranged on a space of 12 feet by 9 feet. The Silver Challenge Cup, valued £10 10s., together with a cash prize of £5, offered as 1st prize was won by the Misses ROBINSON, Leamington, for a pleasing arrangement of well-grown foliage and flowering plants. The central feature of the exhibit consisted of a rustic bridge, on which choice foliage and flowering plants were used with good taste. Handsome plants, particularly reddish-leaved *Codæums*, together with *Dracænas*, *Odontoglossums*, *Verbenas*, *Begonias*, *Streptocarpus*, &c., were effectively displayed in the body of the group. J. H. BURLEY, Esq., Leamington (gr. Mr. H. J. Finch), was a good 2nd, and C. C. SHAW, Esq., Leamington, was placed 3rd.

FRANK DENNISON, Esq., Leamington, secured the 1st prize for 12 Roses, dissimilar, and another for six Tea Roses, dissimilar. Mr. W. J. NASH, Coventry, had the best half-dozen Roses, one variety, in splendid blooms of Mrs. John Laing. Mr. J. W. LAMPLOUGH, Leamington, exhibited the best six varieties of Sweet Peas, and HUGH MITCHELL, Esq., Hampden-in-Arden (gr. Mr. T. Batchelor), took the lead in a class for *Delphiniums*. Mrs. ROGERS, Leamington, was the only exhibitor of six spikes of *Gladioli*. The best half-dozen bunches of hardy border flowers came from J. B. ARKROYD, Esq., Rugby. Miss E. A. WHEILDON, Leamington, showed the best *Carnations*, and Mrs. E. T. BROMLEY had some very fine *Cactus Dahlias*.

The Rev. F. HODGSON, Clopton House, Stratford-on-Avon, again won the Silver Challenge Cup, value 15 guineas, presented jointly by Mr. F. Benison and Mr. F. J. Land, and £2, offered for four dishes of fruit to be selected from certain specified kinds. It was a curious coincidence that each of the four exhibitors should have selected Muscat Grapes, Nectarines, Peaches and Melons. The winning collection was very meritorious, Nectarines and Grapes being especially fine. 2nd, The Marquis of HERTFORD (gr. Mr. C. Harding). The last-named exhibitor showed (1) the best two bunches of Black Grapes, having well-finished examples of Madresfield Court, and (2) the best dish of kitchen Apples. F. T. GARLAND, Esq. (gr. Mr. W. Kean), sent the winning pair of bunches of White Grapes. He showed Muscat of Alexandria in excellent condition. In a class for six Nectarines, the Rev. F. HODGSON took the lead with beautifully-coloured fruits of Rivers's Orange. J. H. BURLEY, Esq. (gr. Mr. H. J. Finch), had the leading dish of six Peaches, the Rev. F. HODGSON being a very close 2nd. Mrs. ROGERS beat nine contestants in a class for dessert Apples, and Lord WILLOUGHBY DE BROKE (gr. Mr. J. Lloyd), exhibited the best dish of Cherries.

In the vegetable classes F. E. MUNTZ, Esq. (gr. Mr. H. S. Foster), won the 1st prize in a class for six kinds, Lord WILLOUGHBY DE BROKE (gr. Mr. J. Lloyd) being placed 2nd.

TABLE DECORATIONS.

There was good competition in the classes provided for dinner tables, each 8 feet by 4 feet, decorated with flowers. In the open class there were seven exhibits. The 1st prize was won by Sir GEORGE H. KENRICK (gr. Mr. J. V. Macdonald), whose dainty arrangement of sprays of the small-flowered *Oncidium flexuosum*, *Phalænopsis* and *Cattleya*, displayed in rustic silver stands, were much admired. Various tinted sprays of *Selaginella* and *Codæum* leaves were used with good effect. The 2nd prize was gained by W. STIRLING STUART, Esq., Leamington (gr. Mr. H. Cleaves),

who relied upon *Oncidium flexuosum*, *Gloriosa superba* and *Clianthus Dampieri*. Long sprays of *Selaginella* and *Ceropegia Woodii* were very effective.

In another class, open to ladies only, the prizes were offered by Robert Sydenham Limited. Miss DEAKIN, Hay Mills, Birmingham, won the 1st prize with a pretty arrangement of pale-pink Sweet Peas.

FRUIT (OPEN).

The principal class was for eight distinct dishes of fruit, Pineapple excluded. Two bunches each of black and white Grapes were allowed. The 1st prize consisted of a 25-guinea Silver Challenge Cup, presented by R. E. L. Naylor, Esq., together with £6 offered by the society. Each collection had to be decorated with flowers and foliage, for which separate awards were made.

The 1st prize was won by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), who showed handsome Black Hamburgh and Muscat of Alexandria Grapes, Pineapple Nectarine, Crimson Galande Peach, Lockinge Melon, Brown Turkey Figs, James Grieve Apple, and Jefferson Plums. The decorations comprised pink Malmaison Carnations, Asparagus, and sprays of *Selaginella*. 2nd, J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker), whose best examples were Madresfield Court Grape, Dryden Nectarine, Dymond Peach, Ribston Apple, and Dr. Jules Guyot Peas. Sweet Peas, François, and Carnations were used as decorations. 3rd, The Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. Goodacre), whose Black Hamburgh Grapes were excellent. The decorations consisted of Carnations, François, &c.

In a class for four dishes of fruit, the Duke of PORTLAND (gr. Mr. J. Gibson) was again to the fore with beautifully-finished bunches of Black Hamburgh Grapes—the most perfect bunches of this variety in the show—Crimson Galande Peach, Brown Turkey Fig, and Royal Jubilee Melon. 2nd, The Earl of HARRINGTON (gr. Mr. J. H. Goodacre), whose Peaches and Nectarines were meritorious, but the Muscat Grapes were small in berry.

The Marquis of HERTFORD, Ragley Hall, Alcester (gr. Mr. C. Harding), showed the best two bunches of black Grapes with the variety Madresfield Court. 2nd, The MANOR FRUIT FARM, Knowle (gr. Mr. W. Wilkins), with Black Hamburgh. The two best bunches of white Grapes were Muscat of Alexandria, exhibited by the Earl of HARRINGTON (gr. Mr. J. H. Goodacre). 2nd, F. T. GARLAND, Esq., Moreton Hall, Moreton Morrell (gr. Mr. W. Kean).

The Duke of PORTLAND (gr. Mr. J. Gibson) gained 1st prizes in the classes for (1) six Peaches, showing large, well-coloured fruits of Crimson Galande, (2) six Nectarines, with handsome specimens of Spencer, (3) three dishes of dessert Apples, and (4) six dessert Apples. The best dish of six Apricots came from Lord WILLOUGHBY DE BROKE, Compton Verney, Kineton (gr. Mr. J. Lloyd), who also showed the best dish of nine Plums and the best dish of Cherries. The Rev. F. HODGSON, Stratford-on-Avon, beat seven competitors in a class for the best-flavoured Melon. Mr. T. MARSH, Warwick, won 1st prizes in classes for (1) three dishes of kitchen Apples, and (2) a dish of kitchen Apples. The Rev. J. J. AGAR ELLIS, Offchurch (gr. Mr. E. Dolphin), beat all contestants in classes for Gooseberries and Red Currants, and E. FIELD, Esq., Leamington (gr. Mr. S. Billingham), excelled in the classes for Black and White Currants.

VEGETABLES

In the society's class for ten distinct kinds of vegetables Mr. JOHN HUDSON, Leicester, led with a good collection. The same exhibitor also secured the 1st prize for (1) 12 Tomatos, (2) Peas, (3) Scarlet Runner Beans, (4) long-pod Beans, (5) Broad Beans, and (6) Carrots.

Messrs. Sutton & Sons offered prizes for six distinct kinds. 1st, Mr. JOHN HUDSON, whose Tomatos, Onions, Cauliflowers, and Celery were very good. 2nd, Mr. E. DEAKIN, Hay Mills, Birmingham.

Mr. JOHN HUDSON was the only exhibitor in Messrs. Webb & Sons' class for six distinct kinds, and he was deservedly awarded the 1st prize.

Messrs. Dickson & Robinson's prizes were offered for six distinct kinds. 1st, F. E. MUNTZ, Esq., Umberslade Hall, Birmingham (gr. Mr. H.

S. Foster), who showed good examples of Money-maker Tomatos, Snowdon Cauliflower, Express Potato, and Intermediate Carrot. 2nd, Lord WILLOUGHBY DE BROKE (gr. Mr. J. Lloyd). 3rd, Captain STARKEY, Leamington (gr. Mr. G. L. Blackburn).

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & SONS, Reading secured the Silver Challenge Cup, value 30 guineas, offered by Alderman Holt for the best non-competitive exhibit to occupy a space of 250 square feet. Messrs. SUTTON's group contained a representative collection of vegetables and saladings, some good Melons, and a bright display of annual and other flowers. A series of arches clothed with *Antirrhinums* formed a pretty background to this effectively-arranged exhibit.

A Gold Medal was awarded to Messrs. WEBB & SONS, Stourbridge, who missed winning the challenge cup by only four points. They had a large collection of fruit, flowers and vegetables of excellent quality.

The most extensive, varied and best-arranged group of choice stove and greenhouse plants was displayed by Messrs. JAMES VEITCH & SONS, Chelsea, who had beautifully-coloured foliage plants, choice Orchids, *Nepenthes*, *Liliums*, *Statice*, and a host of other good subjects arranged on a very low staging. (Gold Medal.)

Messrs. JARMAN & Co., Chard, exhibited Sweet Peas, zonal *Pelargoniums* and *Centaureas*. (Silver Medal.)

ROBERT SYDENHAM LIMITED, Birmingham, showed a choice collection of Sweet Peas in silver rustic stands. (Silver Medal.)

The TULLY NURSERIES, Kildare, staged a collection of new varieties of hybrid *Gladioli*. (Gold Medal.)

Messrs. GEORGE BUNYARD & Co., Maidstone, exhibited a large collection of *Phloxes*, *Delphiniums* and *Nymphæas*. (Silver Banksian Medal.)

Messrs. JOHN WATERER & SONS, Bagshot, had a bright group of *Hollies*, *Conifers* and Japanese Maples. (Gold Medal.)

Messrs. DICKSONS, Chester, showed *Roses* and miscellaneous hardy flowers. (Silver Medal.)

Mr. T. MARSH, Warwick, exhibited Apple trees in pots bearing good crops of fruit. (Gold Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, staged a large collection of Sweet Peas. (Silver Medal.)

Messrs. FRED. SMITH & Co., Woodbridge, had an assortment of hardy border flowers. (Silver Medal.)

Messrs. ALDERSEY and MARSDEN JONES, Tilston, Malpas, exhibited Sweet Peas, sprays of hardy shrubs and miscellaneous herbaceous flowers. (Silver Medal.)

Mr. W. HARPER, Leamington, showed cut flowers. (Silver Medal.)

The LAPWORTH NURSERIES, Hockley Heath, staged a group of *Pentstemons*, *Hollyhocks*, and varieties of *Lobelia cardinalis*. (Silver Banksian Medal.)

Messrs. HINTON BROS., Warwick, exhibited a group of plants and cut flowers. (Silver Banksian Medal.)

SOUTHAMPTON ROYAL HORTICULTURAL.

JULY 28.—This society held its 13th annual exhibition of Carnations and Sweet Peas in the Pier Pavilion on this date. Entries were fewer than usual, and the display was, therefore, less attractive than usual.

In Division I. nine classes were "open to all," five of these being for dressed flowers.

For 12 blooms of *Flakes* and *Bizarres*, distinct, two competed, Messrs. A. R. BROWN, LTD., Wychall Nurseries, King's Norton, winning the 1st prize easily with fairly good blooms of *Reliance*, Mrs. T. Lord, Ethel Macrae, Geo. Rudd, W. Prescott, and *Cleopatra*. 2nd, Mr. HAYWARD MATHIAS, Medstead. The same exhibitors occupied similar positions in the class for 12 *Fancies*, distinct. *Devonian*, *Alice Byron*, *Pasquin*, *Attraction*, and *Orlando* were the more prominent blooms in the premier collection. Messrs. BROWN was also placed 1st for 12 *Sels*, distinct, *Daffodil*, *Hadzor*, *Aleppo*, *Major Galton*, *Alderman*, and *Iberia* being noteworthy. In the class for 12 Yellow-ground *Picotees* Mr. HAYWARD MATHIAS beat Messrs. BROWN, but this firm won the 1st prize in the class for 12 White-ground *Picotees*.

VASE CLASSES.

There were three entries in the class for three distinct varieties, five blooms of each sort. Messrs. A. R. BROWN again excelled, having choice flowers of *Cambria* and *W. H. Parton*. 2nd, Mr. W. H. PARTON, Moseley, Birmingham, with choice blooms of *Margaret Thurston*, *Gaiety* and *Clement*. Messrs. BROWN also excelled in the class for three *Fancies*; whilst Mr. HAYWARD MATHIAS occupied a similar position in the class for three Yellow-ground *Picotees*. In a small competition Messrs. BROWN won the 1st prize for vases of *Sels*, *Fancies*, and Yellow-ground *Picotees* with *Agnes Sorrel*, *Elizabeth Shiffrer*, *Solfaterre* and *King Coffee*. 2nd, Mr. HAYWARD MATHIAS.

AMATEURS' CLASSES.

In the amateurs' section Mr. W. H. PARTON was the most successful exhibitor, winning the 1st prizes in the classes for six *Fancies*, six *Sels*, and six Yellow-ground *Picotees* with medium-sized, neatly-dressed flowers. In the vase classes also Mr. PARTON was unassailable, winning the 1st prizes for *Sels*, *Fancies*, and Yellow-ground *Picotees*, *Fancy*, *White*, *Blush* and *Crimson Carnations*. Mr. J. H. LINNINGTON, Newport, Isle of Wight, had the best of three exhibits in a class for one vase of a Yellow Self *Carnation*, and he was also placed 1st for a *Terracotta Self*.

American or Tree *Carnations* were best shown by Mr. F. CHANDLER, 75, Shirley Road, Southampton.

PREMIER BLOOMS.

Bizarre: *Reliance* (Messrs. A. R. BROWN); *Flake*: Mrs. T. Lord (Messrs. A. R. BROWN); *Fancy*: *Hecla* (Mr. HAYWARD MATHIAS); *Yellow-ground Picotee*: *Lady Douglas Galton* (Mr. HAYWARD MATHIAS); *White-ground Picotee*: *Lady Ethel* (Messrs. A. R. BROWN).

ROYAL SCOTTISH ARBORICULTURAL.

JULY 24-29.—At the Inverness Show of the Highland and Agricultural Society of Scotland, a forestry exhibition was organised by the Royal Scottish Arboricultural Society. The display was of a most practical character, and was grouped under two main sections: (1) Articles in competition, and (2) articles for exhibition only. In the competitive section the visitor found the normal and abnormal in growth and structure, results from proper and improper pruning, characteristic fungi, samples of damage caused by squirrels, voles and other creatures, and a superb collection of injurious insects from the larval stage upwards. An outstanding feature of the exhibition was the fine display made by Mr. SCOTT and his assistant, Mr. WATT, from the Darnaway Estate. It comprised over 50 varieties of cones of Pine trees and nearly 40 varieties of native-grown timber. The collection of planks from this estate was much admired. Another fine exhibit was that sent by the Countess Dowager of SEAFIELD (forester Mr. Gilbert Brown). The specimens of wood shown were all grown in Abernethy Forest. Six sections of Larch, three of which indicated decayed heart rot and the other three sound timber, showed to a certain extent the effect that different soils have on the health, and, therefore, on the quality of the timber. The plants shown were all cut from trees grown at an altitude of from 700 to 800 feet above sea level. It was explained that the exhibits showing heart rot were taken from trees grown on soil with a thin upper layer of medium forest soil, with a very indifferent under layer, the latter being either rock, pan, or gravel. It is not to be thought, however, that all the Larch grown on this area suffered from heart rot, but it was insisted that on areas composed of soil of the nature just described, heart rot is common. The sound specimens shown by Mr. BROWN were all taken from trees grown on soil that had a considerable depth and good natural drainage. Mr. BROWN also showed samples of the turf taken from woods being prepared for natural regeneration. Brodie, of Brodie, one of the judges, in his report, commented very favourably on Mr. BROWN's fine display. There were also fine displays from the estates of the Earl of MORAY, the Marquis of GRAHAM, Lochiel; Captain STIRLING of Keir; Sir WILLIAM GORDON CUMMING, Bart.; Mr. DYSON PERRINS, of Ardross, and Mr. DAVID LECKIE, Kippenross. The Ardross Estate exhibits deserve special mention for the fine collections in every section.

MARKETS.

COVENT GARDEN, August 2.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

REMARKS.—English Cherries are practically finished, only a few fruits of Bigarreau (Turkey Heart) and Bigarreau Napoleon being obtainable at high prices. Supplies of Currants are also very limited. Dessert Gooseberries have realised high prices during the past week. Black Grapes continue to sell well. Tomatoes have been very plentiful and cheap; their prices will doubtless be lower still, as large quantities are arriving in a ripe condition. The market is also receiving large consignments of Tomatoes from France and Holland. The last shipment of Australian Apples arrived this week; the fruits met with a moderate sale. Peaches and Nectarines are a limited supply, with a slight increase in their values. Melons from all sources are very plentiful, and they are in consequence cheaper. Figs, both English and Channel Island grown, are plentiful and are meeting with a fairly good demand. The vegetable trade shows a decided improvement as compared with last week. E. H. R., Covent Garden, August 2, 1911.

REMARKS.—Trade is fair. The supply of tubers is a very light one on account of the early corn harvest. Edward J. Newborn, Covent Garden and St. Pancras, August 2, 1911.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 29, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Over England the weather, although mostly fair to bright, was more variable than during the preceding week; while in Ireland and Scotland the general condition was unsettled and rain frequent. Thunderstorms occurred in various districts on the 25th and 26th, a violent thunderstorm in London and some other parts of southern England on Friday, and on Saturday thunderstorms were experienced over the kingdom generally, those in Ireland being, locally, very severe.

The temperature was above the average, the excess being very slight in Scotland N., but large in all parts of England. The absolute maxima were again unusually high, and were generally recorded during the latter part of the week. They ranged from 93° in the midland counties, 92° in England S.E., and 91° in England N.E. and S.W., to 76° in Scotland E., and to 70° in Scotland N. The lowest of the minima, which occurred during the earlier half of the week, varied from 37° in Scotland E. to 43° in England S.E., and to 57° in the English Channel. On several nights the minima over a large portion of England were as high as 60°. The lowest grass readings were 29° at Llangamarch Wells and 34° at Burnley, Balmoral and Crathes.

The rainfall was much less than the average in nearly all parts of England and in Scotland E., but considerably more in Ireland, Scotland N. and W., and the English Channel district. At Alnwick and Bath the week was rainless, and in some other parts of England there was less than 0.10 inch. During the thunderstorm in London on Friday 1.1 inch fell in South Kensington in 15 minutes, at Kilkenny during the storm of Saturday 2.14 inch fell between 4.30 p.m. and 7 p.m., and at Dublin 1.21 inch in 45 minutes. At Cahir the rainfall amounted to 1.93 inch.

The bright sunshine was again in excess in England, but deficient in Scotland and the north of Ireland, and only equal to the normal in Ireland S. The percentage of the possible duration ranged from 67 in England S.E., 63 in England E., and 60 in the English Channel, to 23 in Ireland N. and Scotland E., and to 14 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending August 2.

The fourth hot and dry week in succession.—The day temperatures have again been very high during the past week, the highest readings in the thermometer screen on five of them ranging between 80° and 90°. The latter is the highest reading as yet recorded here this year, and has only twice before been equalled in July during the past 25 years. The nights, although warm, were again not nearly so unseasonably warm as the days. The ground is at the present time 5° warmer than is seasonable, both at 1 and 2 feet deep. Rain fell on four days, but the total measurement only amounted to about half an inch. During a thunderstorm on the evening of July 28, however, rain was falling for five minutes at the average rate of 1½ inches an hour. No rainwater at all has now passed through either of the percolation gauges for more than four weeks. The sun shone on an average during the week for nearly 9½ hours a day, which is 3½ hours a day in excess of the usual duration at the end of July. Light airs again prevailed, the direction being almost exclusively some southerly or westerly point of the compass. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by as much as 18 per cent. On each of the first three days of the week the difference between the readings of an ordinary thermometer and one with its bulb kept constantly moist amounted, at 3 o'clock in the afternoon, to as much as 18°.

JULY.

The hottest and sunniest month, and also the one with the driest air.—The mean temperature of July was 4½° higher than the average for the same month in the past twenty-five years, and higher than in any month whatever in any of those years. The days were also as exceptionally warm, but the nights although as a rule very warm, were not nearly as unseasonably warm as the days. The highest reading in the thermometer screen was 90°, a temperature which has only twice before been equalled in July during the past twenty-five years. On thirteen days the highest reading in the thermometer screen exceeded 80°; on five days it was above 85°, and on one day reached 90°. The lowest temperature registered by the exposed thermometer was 35°, which is rather below the average July minimum. Rain fell on only four days, and to the total depth of little more than half an inch, which is 1½ inch below the average for the month. Between the 1st and 27th, or for twenty-five days, no measurable quantity of rain fell. Although such a very dry month there have been five other Julys in the last fifty-five years which have here had as small a rainfall. The sun shone on an average for 10½ hours a day, or for four hours a day longer than is usual in this mid-summer month. The previous highest daily average was in May 1909, when 9½ hours was recorded. The winds proved very light, indeed, with two exceptions, lighter than in any of the previous twenty-five Julys. In the windiest hour the mean velocity only amounted to eleven miles. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by as much as fifteen per cent.—making the amount of humidity in the air lower than any recorded in any other month whatever during the past twenty-five years. E. M., Berkhamsted, August 2, 1911.

LAW NOTE.

SALE OF "PLANT FOOD."

At the Wakefield City Police Court on the 19th ult., a manufacturer, of Rochdale, appeared to answer a summons taken out against him under the Fertilisers and Feeding Stuffs Act. Mr. R. Jones, who prosecuted on behalf of the West Riding County Council, said that defendant sold to Mr. J. H. Sheard, of Wakefield, an article described as "Burgess's Famous Plant Food." It was sold in penny packets, and was stated to contain 22.08 of phosphorus, whereas when analysed by Mr. B. A. Burrell, the Deputy Agricultural Analyst for the West Riding County Council, it only actually contained 1.84, a deficiency of 20.24. The defendant sold it at the rate of £38 per ton, whereas it only cost 16s. per ton. It was a gross fraud on the public, for what had been sold was of very little use indeed, and they wanted to protect the public in Wakefield and the West Riding from purchasing such an article. —Defendant, who said that he had committed the error in ignorance, was ordered to pay a fine and costs amounting to £3 10s., or go to prison for a month.

DEBATING SOCIETY.

BRISTOL AND DISTRICT GARDENERS'.—The monthly meeting was held on July 27 at St. John's Parish Rooms; Mr. Perry presided. An interchange of lectures with Brislington was inaugurated, and Mr. W. J. Pollard, who represented that society, gave a lecture on "Begonias." A discussion followed.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

- Mr. C. R. FIELDER, for the past 12 years Gardener to Mrs. BURNS, North Mymms Park, Hatfield, as Gardener to Miss WILLMOTT, Warley Place, Great Warley, Essex.
- Mr. JAMES A. PAICE, for the last 2½ years Gardener to Vice-Admiral Sir JOHN JELLCOE, Thornton, Harrow Weald, Middlesex, as Gardener to P. F. WARNER, Esq., Caring House, Leeds, Maidstone. (Thanks for contribution to R.G.O.F. box.—Eds.)
- Mr. G. A. RIDLEY, for 10 years Gardener to the Right Hon. Viscount DEERHURST, at Dynes Hall, Halstead, Essex, as Manager of the Broome Nurseries, near Stourbridge, Worcestershire.
- Mr. E. M. STREETER, for the past 14 years Gardener to Mrs. JELLINGS BLOW, Cranham, near Stroud, Gloucestershire, as Gardener to W. CLARK, Esq., Beenham Court, near Newbury, Berkshire. (Thanks for donation of 2s. for R.G.O.F. box.—Eds.)
- Mr. JAMES TANNOCK, for the past 5 years Foreman to G. H. STRUTT, Esq., Bridge Hill, Belper, as Gardener to this gentleman at the same place. (Thanks for 2s. 6d. for R.G.O.F. box.—Eds.)

SCHEDULES RECEIVED.

Maidenhead Chrysanthemum, Fruit and Vegetable Society's exhibition, to be held in the Town Hall, Maidenhead, on Friday and Saturday, October 27, 28. Secretary, Mr. J. Gibson, 24, York Road, Maidenhead.

A useful list of flower show fixtures, principally in Scotland, has been forwarded by Messrs. Austin & McAslan, 89, Mitchell Street, Glasgow. It is in the form of a booklet suitable for the pocket, and should prove of great value to exhibitors. Copies may be had free on application to Messrs. Austin & McAslan.

CATALOGUES RECEIVED.

- CHRISTOPHER BOURNE, Simpson, Bletchley—Daffodils.
- F. HERBERT CHAPMAN, Rye, Sussex—Daffodils.
- LITTLE & BALLANTYNE, Carlisle—Bulbs, Roses, and Fruit Trees.
- STEWART & Co., 13, South St. Andrew Street, Edinburgh—Bulbs.
- H. CANNELL & Sons, Swanley, Kent—Bulbs.
- AUSTIN & McASLAN, Mitchell Street, Glasgow—Bulbs.
- TILLEY BROS., 133, London Road, Brighton—Bulbs.
- JOHN PEED & Son, West Norwood, London—Bulbs.

FOREIGN.

WALTER BLOM & Son, Qverveen, near Haarlem, Holland—Bulbs.

TRADE NOTICE.

MESSRS. STUART LOW & CO.

Mr. Thos. Ives has been appointed Carnation grower to Messrs. Stuart Low & Co., in place of Mr. Allwood, whose retirement was announced in our issue of July 22.

Obituary.

ERNEST SAXBY.—At Burton Manor, Chester, on Wednesday, July 26, Ernest Saxby, foreman in the gardens, was accidentally drowned whilst bathing in the lake. He was a promising young gardener, and had spent two years as decorator in the gardens at Belvoir Castle, Grantham, and had also served in the gardens at Studley Royal, Conishead Priory, Viceregal Lodge, Dublin, Elsham Hall, and Wentbridge House, Pontefract. The funeral took place on Saturday, July 29, at Wentbridge, Pontefract.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

ABIES ORIENTALIS AND SCOTCH FIR: W. E. Your trees are attacked by aphids and Chermes abietis. They should be sprayed twice during the winter with the following specific:—Soft soap, 3 lbs., dissolved in two quarts of boiling water, adding one pint of paraffin when boiling; stir rapidly until a butters mass is formed. Dilute this mixture with five gallons of water.

ANALYSIS OF SOIL: W. B. There is something radically wrong with respect to the figures which you send us of the soil-analysis. Thus the analysis makes no mention of sand or clay without one or other of which substances "soil" cannot be said to exist. Forty-seven per cent. iron and 3 per cent. copper are astonishingly high figures for these substances, which occur in ordinary soils only in traces, and suggest that the "soil" is more suitable for mining than for horticultural purposes. Chlorides to the extent of 14 per cent. are in exuberant excess. The absence of phosphates and nitrates is, of course, a fatal defect to the use of this soil for purposes of cultivation. No mention is made of potash, which is another indispensable plant food. In short, it may be stated with confidence that nothing whatever in the way of horticultural produce will grow in stuff having the composition given in your analysis.

BEDDING CALCEOLARIAS: John Edwards. The flowers had fallen from the stems when received, and we were unable to form any opinion as to the merits of the varieties.

BEGONIA GLOIRE DE LORRAINE: Anxious. The crinkling of the foliage is caused by eelworm. Three drops of carbon bisulphide should be poured on the crocks through the hole in the bottom of the pot. Do not water the plants for 12 hours after this has been done. Carbon bisulphide is highly inflammable.

CUCUMBER DISEASE: A. H. C. Your plants are affected with the Cucumber leaf-blotch. Spray them with liver of sulphur at a strength of one ounce in three gallons of water.

IRON FENCE: Selsey Bill. Although iron-work is not to be recommended for plant supports, there is less objection to it when it is galvanized. Your Peaches might succeed perfectly well when trained against a galvanised iron trellis work, but it would be advisable to place slips of wood between the shoots and the iron, or you might bind the latter with pieces of cloth before fastening the branches. Great care must be taken to prevent the iron chafing the bark during windy weather.

NAMES OF PLANTS: J. Mason. 1, Antirrhinum glutinosum; 2, Dianthus plumarius; 3, (specimen withered apparently) Lysimachia vulgaris.—J. W., Oak Mount. 1, Campanula trachelium album (the strong-growing one); 2, C. carpatica alba.—Charles Serridge. Aristolochia elegans.—N. A. L. 1, Juniperus sp.; 2, Eucalytus ficifolia; 3, Crataegus prunifolia; 4, C. Pyracantha; 5, Escallonia rubra; 6, Asparagus deflexus.—B. P. Rose Mrs. John Laing.—J. W. Rawdon. Tropaeolum polyphyllum.—W. E. Pontederia coerulea.—A. Hawood. Spiraea Menziesii.—Interested Reader. Heuchera sp.; send when in flower.—J. W.

Tigridia Pavonia (Common Peacock Iris).—H. T. P. 1, Paphinia cristata; 2, Maxillaria luteo-alba; 3, Epidendrum rigidum; 4, Oncidium triquetrum; 5, Oncidium flexuosum; 6, Brassia bicolor.—J. C. Gomesa Barkeri.—P. H. R. Gloriosa grandiflora (Leopoldii): it is a yellow or pale reddish flower closely allied to Gloriosa virescens. (See Supplement in Gardeners' Chronicle, September 10, 1904.)—J. B. O. Robinia hispida.—R. O. Catasetum callosum.

ODONTOGLOSSUM THOMSONIANUM: Bee. The fungus causing the injury is Nectria orchidis. Preventive measures must be adopted. Remove all infected flowering spikes and sponge apparently healthy ones with a rose-red solution of permanganate of potash.

PACKING BULBS IN SAWDUST: S. F. C. Sawdust is often used for packing bulbs, but care should be taken to see that it is perfectly dry. It is not at all injurious to bulbs.

ROSES UNSATISFACTORY: La Rose. Your plants are perfectly healthy, there being no trace of disease. We would advise watering more freely, using liquid manure occasionally. The subsoil appears to be unsatisfactory, and probably some of the trouble is caused through the roots entering this. It would also seem that you have cut away too many of the shoots because they have failed to produce flowers, and at a time when the sap was active, causing a check. If you have 12 main shoots, some already 8 feet long, that is a satisfactory number. It is unusual for this Rose to behave as you describe. You appear to have treated Prince de Bulgarie and Caroline Testout correctly, with the exception that 18 inches is too close pruning. The "blind" growths upon Dorothy Perkins are probably due to the frosts of late May, which caused much harm amongst early varieties.

ROSE LEAVES FOR EXAMINATION: F. B. The leaves are affected with red rust. The minute maggot you refer to feeds on the spores of the fungus; it is therefore not an enemy, but a friend. Burn all fallen leaves during the winter.

TOMATO LEAF WITH SPOT: Tower Lodge. The leaves are affected with Tomato leaf-rust. They should be sprayed with liver of sulphur at the rate of one ounce to two gallons of water, but if the foliage is soft, use three gallons of water.

VIOLAS UNSATISFACTORY: J. L. and J. P. The trouble is due to the soil being infested with the fungus Botrytis. Treat the ground with quicklime.

WILLOW BARK INFESTED WITH PARASITES: H. W. The Willow is attacked by the Ash and Willow scale (Chionaspis salicis). The piece of bark sent is covered with male scales, and the red-winged, minute males are hatching out. The creature does some harm to the trees, but not to the same extent as the scale insects that may attack fruit trees. If an ornamental tree is attacked by this scale, it may be well to destroy the insect by spraying or scrubbing the bark with paraffin emulsion. When Ash poles that have been attacked are cut, the peelings should be burnt at once. Probably your informant from abroad was confusing this pest with the destructive San José scale.

WEED OVERRUNNING A GARDEN: E. C. The plant you send is Polygonum cuspidatum, a native of Japan, and introduced to gardens in this country in 1825. This Polygonum extends very rapidly by means of its underground stems, but we have never heard of a similar case where it was found impossible to eradicate it from a garden. By trenching the ground and throwing out every portion of the underground stem met with, you should get rid of it. If you cut off the growths whenever they appear above ground, this will considerably weaken the plant.

SAND DUNES.

THE modern naturalist is not infrequently charged with inability to express the results of his observations in form intelligible to the layman, and this lack of literary gift on his part is contrasted forcibly with the charm which characterises the writings of the older school of naturalists. The criticism is, we think, deserved, though signs are not wanting that the students of natural history are awakening to the real necessity of bringing the results of their labours to the notice of a wider public than that constituted by one another. Thus, for example, in one of the recent volumes of the *Manuals of Science and Literature*, Professor Bower demonstrates that it is possible—indeed, the careless reader perusing his pages might think it is easy—to put the main conclusions of his investigations on the origin of land floras* in a form which is popular in the best sense of the word. That is to say, he

writes well and picturesquely, and simply enough to be intelligible to any educated person. Of the several interesting chapters in which Professor Bower sketches the struggle whereby primitive plants have made their way landward from the sea, we do not propose to speak here. We must content ourselves with giving an outline of the excellent account, contained in Chapter 8, of the origin of those bulwarks of low-lying coasts, the sand dunes.

After pointing out that many of our cultivated vegetables are the descendants of sea-shore plants—Cabbage, Sea-kale, Carrot, and Beet, among others—and explaining that in thus exploiting them for culinary purposes, man is only taking advantage of a succulence which a saline habitat induces in plants, Professor Bower takes us down to the sea beach and shows us the sand dunes in the making. Two agents are involved in the fashioning of the dune from the sand, the wind and vegetation. The wind brings the material and the vegetation constructs the mound, which, rising higher year by year, becomes at last the chain of hillocks which acts as a barrier to the sea and checks its encroachment landward.

In the beginning, wind and plant co-operate; but wind is proverbially fickle and is apt to destroy what it has helped to create. Thus, where the plant-preservers of the dunes are not present in sufficient numbers, every blast which comes from over the ocean plays capricious tricks with these sandy hills, co-operates with the big tides to undermine their flanks and bring the sand of which they are made tumbling to the beach again, only to be hurried away and to start elsewhere the upbuilding of the transitory white, or shifting dunes. On the other hand, where plants are present in force, the white dune changes complexion slowly as it becomes covered with vegetation and settles down as a grey dune to comparative permanence.

Not all plants, however, are adept at dune formation. The annual, for example, may begin the task, but before its efforts have been rewarded by any but the puniest of results its life is over “and all the rest forgot for which it toiled.” As in elections in the States, those specialists of eloquence called spell-binders alone have power to weld vast numbers of people together so that they vote as one man, so in the building of the grey dune, only those plants which can hold the sand which the wind heaps up about them may act as sand-binders. Easily first among British sand-binding plants is the Marram Grass or Bent (*Ammophila arundinacea*). To it the white dunes owe in the main what slender permanence they have, and on its foundations the grey dune is built.

Truly, the requirements for the performance of the rôle of sand-binder are great. The plant must be a xerophyte, that is, must be fitted by its structure to withstand the dryness of the upper zone of the sea beach. It must be indifferent to large amounts of salt, which, as those who use that substance as a weed-killer know, is deadly to many Grasses as well as other

plants. It must have dense masses of runners underground, in the meshes of which the shifting sand is imprisoned. It must be strong as strongest cord to resist the strain which the loose heaps of sand above may bring to bear upon it. Above all it must possess the capacity which saves it from being buried alive. Though a ton of sand fall upon it, covering it to the depth of many inches, or even feet, the plant must be able to grow in length till the spear-like tips of its rhizome emerge triumphantly from the depths into the light of day. All these qualities the Marram Grass possesses, and by virtue of them it has become the pioneer of the grey dunes. Between it and the wind a ceaseless struggle wages, and victory leans now to one and now to the other. Prime among the factors which decide the campaign are the presence of other vegetable allies of the Marram Grass. One, the importance of which is more considerable than is generally supposed, is the Sea Thistle, *Eryngium maritimum*. Its fleshy root possesses almost unlimited powers of growth, and when a dune is cut through the brown roots of this plant may be seen extending vertically downward as much as 10 feet from the surface. Nothing is more instructive than the sight of such a section of a dune. The sides of sand are held firm by the dense mass of runners of the Marram Grass, and at the bottom of the cutting the upstanding roots of the Sea Thistle reveal the warp on which the weft of Marram Grass was strained. And soon, such is the recuperative power of dune-plants, tops of the cut-off Sea Thistle heal their surfaces, form buds, and grow again to serve as a scaffolding to support the building of the dune. Other plants which aid the growth of the dune are such woody plants as the Creeping Willow (*Salix repens*), and even inconspicuous plants like the Rest Harrow (*Ononis spinosa*) and the little Burnet Rose (*Rosa spinosissima*). The Sea Buckthorn (*Hippophae rhamnoides*), once established on the dune, does yeoman service in the cause of conservation. Lastly, when the dune is grey, the Gorse, the Heather and the Ling make their appearance, and the Gorse crowns the dune and the sandy coast for miles with a crown of gold in spring-time as a token of the subjection of the sand to the beneficent rule of plants.

We have no space here and now to recount the fascinating story which Professor Bower tells of those neighbours of the sand dunes, the golf links; suffice it to say that Professor Bower is by domicile a Scot, and when he writes of golf links has nothing to say of those spurious imitations, the inland courses, but confines, at all events, his botanical study of the links to those where the sea sand beneath the fine grass of the fairway makes a cushion for the feet and a perfect lie for the ball, where the Bents of Marram lurk to hold the sliced or pulled ball as firmly as they hold the sand, and where anyone who fozzles a shot may attribute it to the noise made by the sea clamouring to break the lines of the dunes.

NEW OR NOTEWORTHY PLANTS.

POTENTILLA VEITCHII, E. H. WILSON, N.SP.*

THIS is an evergreen shrub, growing 3 to 5 feet high, with very much the general aspect of *P. fruticosa*, from which, however, its pure white flowers amply distinguish it. From *P. davurica* Nestl., which has white flowers, it is even more distinct, and does not in any way show the close dwarf growth so characteristic of that species. In a broad sense, the three may be regarded as extreme forms of one species, but for purposes of convenience it is best to distinguish them under separate names, especially as *P. Veitchii* will shortly be distributed.

This new *Potentilla* was introduced by me in 1900 to Messrs. James Veitch & Son's Coombe Wood Nursery, where it flowered for the first time in 1902. In 1907 I sent plants to the Arnold Arboretum. In a wild state, *Potentilla Veitchii* is common in the upland thickets of Western Hupeh and Szechuan, above 6,000 feet altitude. It inhabits open, rocky situations, fully exposed to the sun and is remarkably floriferous. Though the plant is at its best in the early summer, it flowers continuously from early May on to late autumn, producing sprays of snow-white flowers raised well above the grey-green foliage. This new *Potentilla* is altogether a charming and attractive plant.

LONICERA NITIDA, E. H. WILSON, N.SP.†

MR. A. REHDER, in his valuable *Synopsis of the Genus Lonicera*, published by the Missouri Botanic Garden in 1903, has, at p. 76, made this bush Honeysuckle a variety (var. *yunnanensis*) of *L. pileata*, Oliver. But in habit and leaf characters it is so very distinct from *L. pileata* that the more convenient course of giving it specific rank seems desirable.

The general aspect of *L. nitida* suggests a small-leaved, evergreen Privet, and it was originally named *L. ligustrina*, var. *yunnanensis*, by Franchet. With this Indian species it has little in common, and since there is already a climbing Honeysuckle named *L. yunnanensis*, it is necessary to adopt an entirely new specific name. *L. pileata* is a fluviatile shrub, almost prostrate in habit, with horizontally-spreading branches, and is common at low altitudes in Hupeh and Szechuan. *L. nitida* is an erect-growing plant, with more slender shoots, much smaller, thicker and more rounded leaves. It is found in Szechuan and Yunnan at higher altitudes than *L. pileata*, and is certainly a hardier plant.

Kew Herbarium possesses specimens, collected in Yunnan by MM. Duleaux and Bodinier, which seem identical with our plant, but there is no reference to the habit of the plant. The specimens collected by Père Soulie and Delavay have larger leaves, and rather suggest a plant with horizontal habit.

Lonicera nitida has been distributed from the Arnold Arboretum into several gardens from plants collected by myself. In this country specimens are growing at Kew Gardens, Coombe Wood Nursery, Aldenham House and Warley Place.

The name *nitida* has reference to the brilliant gloss on the upper surface of the leaves.

* *POTENTILLA VEITCHII*, E. H. Wilson, N.SP.—An evergreen shrub, 3-5 feet of neat, rounded habit, young shoots clothed with pale silky hairs; leaves pinnate, including petiole $\frac{3}{4}$ to 1 inch long; leaflets 3-5 inch, sessile, oval, $\frac{3}{4}$ inch long, greyish-green above, somewhat glaucous beneath, both surfaces covered with silky hairs. Flowers usually solitary at the ends of short twigs, pure white, $\frac{3}{4}$ to 1 $\frac{1}{4}$ inch across; petals broadly obovate, peduncle and calyx silky.
W. Hupeh, 6-9,000 feet. Wilson, Nos. 2,062 and 2,187, in Herb. Kew. Seed No. 1,087, Veitch.

† *LONICERA NITIDA*, E. H. Wilson, N.SP.—Evergreen shrub 3-6 feet high of very neat, even dainty, habit; branches erect, densely leafy, when young purplish, clothed with short pubescence with erect bristles interspersed. Leaves coriaceous, ovate with a sub-cordate base, polished dark-green above, very pale beneath, $\frac{3}{4}$ to $\frac{5}{8}$ inch long, obtuse; petiole $\frac{3}{8}$ inch long, furnished with minute bristles; a few minute, scattered, ultimately deciduous bristles on the upper surface of the leaf and on the midrib. Flowers in pairs, creamy-white, fragrant. Fruits globose, the size of a large pea, blue-purple and ornamental.
W. Szechuan, 4,500-7,000 ft. Wilson, No. 833 in Herb. Arnold Arboretum.

This character and the habit render the new plant one of the most distinct of all bush Honeysuckles.
E. H. Wilson.

PRIMULA GAGNEPAINII.

PRIMULA GAGNEPAINII (see fig. 47) belongs to the "cortusoides" group of *Primulaceæ* found in Western China, which includes *P. Veitchii* and *P. lichiangensis*, both recent introductions from that region. Whilst similar in general habit, it differs from these two species in having more orbicular, seven lobed leaves, the lobes being coarsely toothed and lobed. The foliage is also somewhat thinner in texture than in the others. The hairy petioles are about 3 inches long, and the leaf-blades about 3 inches in diameter. The scapes are some 6 inches long,

[Photograph by W. Irving.]

FIG. 47.—*PRIMULA GAGNEPAINII*: FLOWERS VIOLET-PURPLE.

and bear an umbel of violet-purple flowers very like those of *P. lichiangensis*. There is, however, a marked peculiarity in the calyx, which in *P. Gagnepainii* tapers gradually to the base, whilst in the others it has a distinct bulbous appearance. Mr. E. H. Wilson sent seeds from China to Miss Willmott. Plants at Warley Place flowered freely out-of-doors, and survived the winter in the open in sheltered positions. The flowers vary in colour, some being pale with a lighter eye, whilst others are dark purple with a darker zone near the mouth of the tube. The specimen shown in fig. 47 is growing in a pot and flowered in May, lasting in a good condition for a considerable time. Like *P. cortusoides* it is an easy subject to cultivate. The plant is a perennial, and may be increased by means of division in the spring or from seeds, which are produced freely. W. I.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT THE DELL, EGHAM.

ALL interested in Orchids will be pleased to know that Baron Bruno Schröder is maintaining the famous collection of Orchids at The Dell, Egham, and that he is adding choice plants as opportunity occurs. Under the care of Mr. J. E. Shill, the future success of the collection is assured, and a recent visit showed that great progress has already been made, especially with the superb collection of blotched forms of *Odontoglossum crispum*, and in the raising of hybrids.

In the *Odontoglossum* houses, reminders of the rise of the popularity of *Odontoglossums* are seen in some of the earlier forms acquired by the late Baron Schröder. Many of these have received

Awards at meetings of the Royal Horticultural Society. Noteworthy were *O. crispum apiatum*, which received a First-class Certificate in 1886, and which, in its day, held the record for high price; *O. c. Ballantinei* (1884), *O. c. Dellense*, *O. c. nibilius*, *O. c. Rex*, *O. c. Truffautianum*, *O. c. Veichianum*, *O. c. Baroness Schröder*, *O. c. Black Watch*, *O. c. Pittianum*, *O. c. Harold*, *O. c. Starlight*, *O. c. Princess Victoria*, *O. c. Oakfield Sunrise*, and, among recently-acquired novelties, several plants forming the entire stock of the very remarkable *O. c. Dell Sunrise*, of the same class as *Oakfield Sunrise*, but with flowers of waxlike substance, circular in outline, broad, and well rounded in all the segments, and of a pure white, with a very pretty arrangement of small purple markings inside the margins of the petals. The plants of the celebrated varieties of *Odontoglossum Pescatorei* for which the

collection is noted, viz., *Schröderianum*, *Veitchianum*, and *Sanderæ*, are thriving, and among other remarkable *Odontoglossums* were *O. Memoria Baron Schröder*, *O. illustrissimum*, the fine and richly-coloured *O. mirum* "The Dell variety," *O. ardentissimum* *Ebor*, and many other fine novelties which have not yet been exhibited. In several of the houses store pots of seedling *Odontoglossums*, uniformly arranged, and in a perfect condition of health, promise to provide interesting novelties in the near future.

In a moderately low, intermediate house, the forms of *Miltonia vexillaria* were observed in a good condition, the plant of the variety *Memoria G. D. Owen*, which at one time gave trouble, being now well established; also *M. v. superba*, *M. v. Leopoldii*, and other good forms. With these was a fine selection of *M. Bleuana*, also some rare forms of *M. Hyeana* and *M. St. Andre*.

In the same range of glasshouses were many pretty *Cypripediums* and *Calanthe Tracyana*, of the *C. veratrifolia* section, about which little is known. It was shown at the Royal Horticultural Society, May 14, 1889, and received a Botanical Certificate, this being the original plant. The flowers are white, with a pale mauve tint. In the large *Cattleya* house were a few specimens of *Cattleya Gaskelliana* and others in flower, also the always-attractive *Bulbophyllum barbigerrum*, and, suspended overhead, several fine plants of the rare and pretty *Mormodes luxata eburnea*, some of them with strong flower-spikes about to expand their blossoms. This plant is reputedly a very difficult subject to cultivate, and specimens have been lost in many other collections; but at The Dell it has always grown and flowered well, and a considerable stock has been obtained by division.

Amongst a fine batch of *Cattleya Schröderæ* was a strong plant of the handsome *C. Schröderæ* The Baron; forms of *C. Mossiæ*, some of the plants with six leading growths, and other kinds in a proportionately good condition, there being in each section a set of albinos. The original specimens of the *Veitchian* hybrids, *Lælio-Cattleya Bella*, *L.-C. Canhamiana*, *L.-C. callistoglossa*, *L.-C. Dominiana*, and others were included in The Dell collection many years ago, and it is interesting to see that the plants are still vigorous. Others noted were *L.-C. Sibyl*, *L.-C. Bella alba*, and *L.-C. Golden Glory*.

Of a very rich collection of hybrids of *Brassavola Digbyana* the white *Brasso-Cattleya* *Queen Alexandra* was in flower. Amongst the most cherished and handsome Orchids in the collection are *Brasso-Cattleya Baroness Emma* (*C. Hardyana* × *L.-C. eximia*) and *B.-C. King of Spain*, both perfect in shape, and of a charming colour. A batch of *Cattleya Dowiana*, some extra fine specimens having eight or ten leading growths, should make a fine show in their season.

In the warm house, a considerable number of plants of *Calanthe Baron Schröder*, raised at The Dell, are making very large pseudo-bulbs. In a low, intermediate house, the collection of varieties of *Lælia anceps* are vigorous, and sending up their flower-spikes. In other houses are many plants of hybrid *Cattleyas*, *Lælio-Cattleyas*, and *Brasso-Cattleyas* in various stages of growth. The plants in the collection of *Dendrobiums* are forming good growths, and satisfactory progress is evident in every direction.

The old glass houses, which have hitherto accommodated the collection, are being replaced, at some distance from the present block and in a suitably sheltered position, by a new range of modern houses, erected by Messrs. Duncan Tucker & Sons.

There are three ranges, the central one being the broader and loftier, and they include a special house for the raising of seedlings. To admit of a free circulation of air, spaces 12 feet in width are allowed between the ranges. A very large tank is being made for the storing of rain-water; when completed, this will be covered by earth, and

form a central source from whence all the tanks in the houses will be replenished.

Two sectional White Rose boilers, of the Robin Hood class, are installed for heating the houses. Close by are new bothies for the young gardeners, containing everything for comfort. B.

THE MARKET FRUIT GARDEN.

A RECORD JULY.

For sunshine, heat, and drought, so far as memory can be trusted, the past month stands as a record for July, at least in my own district, and in many others, including some of the most important fruit centres, where the conditions appear to have been similar. While showers or storms were reported from northern and western counties, and even as far south as London, great areas of the country were missed by the rains. At my own station the register shows absolute drought for the first three weeks of July. In the night of the 24th there was a fall of 0.08 inches, the effects of which entirely disappeared in a few hours. After that sprinkling we had no rain until the tail of a somewhat distant thunderstorm in the evening of the 29th gave us 0.20 inches, a quantity entirely useless for fruit crops. Further the records show "sunny and warm" or "sunny and hot" for all but three days, and even these were only partly overcast. As a rule, the sun blazed forth from its rising to its setting. I do not keep a record of temperature, but noticed 94° in the shade as having been reached at least once, and 84° to 88° on two or three occasions.

RESULTS.

So far as fruit-growers are concerned, there are two results of the hot drought, absolute or conjectural. That the sizes of Plums and Apples have been seriously reduced by the weather is unfortunately obvious, while the conjectural result is such a ripening of young wood and fruit buds as has rarely been known. The only drawback to the latter result is the almost leafless condition of great numbers of Plum and Apple trees reported from some of the principal fruit districts. My own Plum trees are not devoid of leafage at present, though the foliage of three of the principal varieties is brown from the effects of aphid and red spider infestations, and the only variety of Apples showing unhealthy foliage is one that has been badly infested with red spider. But I read and hear of orchards of both fruits badly defoliated, and this condition may possibly neutralise the effect of the sunshine and heat in reference to the development of fruit buds for next season's crops. Frequent horse-cultivation and hoeing have done much, by creating what Americans call a "dust mulch" on the surface of the land, to retain moisture in it a few inches below the surface, while frequent sprayings have kept down the damage threatened by insect pests. Consequently the wood growth of Apple trees now in their second and third years from the planting, as well as that of trees in their fifth and sixth years, is excellent. This is mentioned because some reports refer to a heavy mortality amongst young trees as having taken place in some districts. Still, Apples on even young trees are below an average size, and they are very much less on mature trees, particularly in the case of an orchard of three acres under grass, in which the fruit is not more than half its usual size. In this respect Plums have suffered even more than Apples, half size being the rule at present. Whether a thorough soaking of the soil now would be in time to cause late Plums to swell or not is doubtful. Probably the latest Apples would swell to some extent, but not greatly, it is to be feared, because premature ripening is taking place. It might prevent among late Apples the extraordinary dropping of fruit noticeable in early varieties. Beauty of Bath is always

a bad offender in this respect; but no approach to the wholesale dropping of this variety has taken place in any previous season in my experience. When all the dropped Apples were picked up on one day, the ground was strewn with them again on the following day. It was chiefly the green and slightly-coloured fruits that dropped. Other varieties, as they approach ripening, are also dropping more or less badly. This is a great loss, because it means that a large proportion of the crop has to be sold at windfall prices, and that in a season almost devoid of strong winds.

FRUIT CROP ESTIMATES.

In reading the estimates of the fruit crops in this journal two questions have presented themselves to me insistently. The first is as to whether the estimators have allowed sufficiently, if at all, for the deficiency in the sizes of the fruits and the excess of dropping; and the second is whether the crops in gentlemen's orchards and gardens are not much better than in commercial orchards. These questions relate chiefly to Plums and Apples. Reports from the principal Plum districts and market prices alike indicate a Plum crop much below the average in market plantations. The verdict as to Apples is less certain; but, bearing in mind the extraordinary deficiency in size, the profuse dropping, and the small crops on young trees of many varieties, it seems to me doubtful whether the weight of this fruit to be marketed will be as large as usual. The number of fruits may be well up to or even above the average; but when two Apples weigh no more than does one in a good season, number does not settle the question of yield. Another point is that, in order to obtain a correct impression as to the fruit crops from estimates, the acreage of fruit in the several counties has to be considered. In other words, each estimate from Kent, Middlesex, Herefordshire, Worcestershire, or Cambridgeshire in relation to fruit to be marketed has a value three or four times as great as one from Bedfordshire, Leicestershire, or Oxfordshire. The great cider Apple counties do not rank in proportion to acreage in connection with market supplies; but accounts are to the effect that there is one of the poorest crops of cider Apples grown for many years. As to small fruits, the prices realised for Gooseberries, Black Currants, and Raspberries indicated a great deficiency in market plantations; but Gooseberries in sheltered gardens bore large crops, and red Currants had splendid crops. With respect to quality, Apples and Pears are much less affected with scab than usual, at any rate where they have been sprayed. Early Plums are described in some cases as "but little more than skin and stone." This is an exaggeration, but the proportion of dwarfed and misshapen fruits is very large. The thick crop of Early Prolific Plums in course of being gathered in my plantation at the time of writing is one of fruits only about half the normal size, and later varieties, for their respective stages of growth, are equally undersized.

SUMMER PRUNING.

This work, so far as mature Apple and Plum trees are concerned, is not attempted by market growers generally, as it needs to be done in the fruit-picking season, when all hands are busy with what is regarded as more urgent work. The opinion that it is valuable mainly for keeping the interior portions of the trees open to sun and air has been expressed previously in this column, and for this purpose it is important for trees of any age which produce new wood freely. As for young trees, summer pruning is absolutely necessary for their best obtainable development, and for some weeks I have been engaged on the work among Apple trees two and three years old from the planting. By the cutting out of surplus growths the young branches left have the vigour of the trees concentrated upon them, while the wood has a better chance of ripening properly. With such young trees clean cutting-out is much more practised by me than spurring, as the great

desideratum is the furnishing of the trees with strong branches just sufficient in number to make good frameworks of symmetrical shape, the interior of each tree being kept well open. The laterals of some varieties are spurred, while internal growths of others are nearly all cut off entirely in my practice. All depends upon whether a variety is of a thin or dense habit of growth.

early spring) pruning. Everyone of the internal side-shoots was cut off cleanly, the young branch, of course, being left at its full length for the present. Possibly, but not certainly, such a branch may be shortened at the next winter pruning. It will be understood that these remarks apply to young trees. In older ones there is often room for more in-

FIG. 48.—LORANTHUS AMPLEXIFOLIUS. INFLORESCENCE AND FLOWER.

Such varieties as Bramley's Seedling, Warner's King, and Blenheim Pippin, as they tend to make comparatively few and sturdy branches, with none too many laterals, may be spurred freely; while Lane's Prince Albert, Cox's Orange Pippin, and Allington Pippin will form an abundance of natural fruit spurs without any assistance. The great difficulty with the first and last of these three varieties is to induce them to grow branches at once long and sturdy enough in an upward direction, their natural tendency being to produce a mass of slender shoots directed to all points of the compass, but least of all upwards. Allington Pippin is the worst variety grown by me in this tendency to produce a dense mass of slender and misdirected shoots, although it is worse than Lane's Prince Albert only because its

ternal spurs, and short artificial spurs are to be preferred to long natural ones. If a tree is sufficiently well furnished next winter with fairly sturdy branches properly directed, no shortening will be done in the case of this variety. Lane's Prince Albert needs a similar treatment. Both will produce more fruit than is necessary without any artificial spurring. My mature trees of Allington Pippin were not trained in this way, and the consequence is that they are masses of twiggy growths, which produce thick crops of small Apples in one season, and no fruit at all, or very little, in the following year. Domino, Lord Grosvenor, and Golden Spire are other Apples which produce a profusion of natural fruit spurs, and are better without any artificial spurs than with them. The majority of culinary

FIG. 49.—FRUITS OF LORANTHUS AMPLEXIFOLIUS.

vigour is so much greater. For this very reason it is more easy to train in a proper form; only cutting out cleanly must be done very severely. In summer pruning some trees of Allington Pippin a few days ago I counted nine laterals as having grown below the point at which a young branch had been shortened at the winter (really the

Apples and the more sturdy of dessert varieties may be spurred freely. Plums, as a rule, require less thinning of the branches than Apples; but young trees need summer pruning nevertheless. It is doubtful whether the spurring of Plum shoots is of much advantage. A Southern Grower.

INDIAN LORANTHUSES AND THEIR HOSTS.

THE chief difference between *Viscum*, the true Mistletoe, and *Loranthus* lies in the fact that, while both are parasitic on trees, the Mistletoe sends its haustoria into the tissues of the host, while the *Loranthus* spreads along the branches by runners, which only at intervals send in their suckers or haustoria. Many of the species are, moreover, extremely handsome, with dark-green, yellow or brown foliage and masses of brilliant yellow, scarlet or orange-coloured flowers, and on certain trees the growth is extremely abundant.

FIG. 50.—LORANTHUS ON DODONÆA VISCOSA.

From this it may be gathered that *Loranthus* is sometimes a very destructive pest. In the low-land scrub jungle of India, valuable in this coal-less country for its fuel, many of the trees are smothered in parasites, and, consequently, are stunted and distorted. On the stately avenues of Banyans along the main roads, great festooning masses of *Loranthus longiflorus* may be noted, but it is in the hill stations that the injurious influence of the parasites is most noticeable. In many parts

of the high mountains the natural "shola" forest, occurring between the grassy slopes in sheltered clumps or gullies, has been largely cut out for firewood, and, but for the introduction of foreign trees in plantations, little of the natural forest would now be left anywhere. Some 50 or 60 years ago large plantations of Eucalyptus and Acacia were laid down, and this has enabled the Government to preserve the remaining sholas with their interesting indigenous trees. But these introduced trees, unaccustomed in their own country to parasitic attacks, have become the natural prey of the different species of *Loranthus* which have of late years increased enormously in quantity. And it is interesting to note that, while the Gum trees are practically untouched, the Acacias or Wattles are everywhere severely attacked. There would appear to be several

Wattle in particular is being literally eaten out, and, although it reproduces itself naturally, it is doubtful whether it will long be able to hold its own. It is, moreover, a grave question whether it should any longer be encouraged on the hills, as all Pear, Orange, Guava, Peach and other fruit trees in its vicinity, besides Tea and Cinchona plantations, are covered by *Loranthus* plants and severely injured.

To the naturalist the study of Indian *Loranthaceæ* suggests many interesting problems. There is no doubt, for instance, that certain species affect certain hosts. In some parts of the plains the Banyans are the only trees affected by *Loranthus loniceroides*; *Cassia siamea* has been noted in others as the only tree attacked by *Loranthus longiflorus*; where mixed growth surrounds a large Black Wattle, itself impar-

while, in the Nilgiris, *L. neelgherrensis* can only be detected among the Tea bushes on casual inspection by the redder tinge of its shoots. The usually broad-leaved *L. longiflorus*, when attacking the fine-leaved *Albizia amara*, develops narrow, falcate leaves and forms the variety *falcata*, and so forth. These isolated examples are very striking, but until the cause is studied further no definite conclusions may be drawn.

The whole question of the mode of dispersal of the seeds is, here as elsewhere, of great interest. From observations made in Brazil, it appears that the birds squeeze the seed, covered with the sticky endocarp and swallow it, rejecting the outer fruit coats. But, while large birds pass the seed through their bodies, smaller ones are accustomed to reject the seeds through their mouth when the sticky food has been partly digested. There appear to be many birds in India responsible for the distribution of *Loranthus* seeds, but prominent among them, from the highest mountains to the hot plains, is the bulbul, and observations have still to be made as to the exact procedure adopted by different birds. For those who wish to prosecute this line of study it may be interesting to know that the base of the seed contains certain marks, caused by the entry of the vascular bundles, by which any seed may be certainly referred to its species, and by collecting birds busy on the trees and emptying their stomachs the connection between bird and parasite can be at once determined.

The germination of the different forms of *Loranthus* presents some very interesting features. In many, the young seedling is enclosed by a transparent mass of gum, within which, in dry weather, the green leaves may be seen like "fruits in aspic," an excellent protection from drying-up until the direct connection with the host's water supply has been made. In *L. neelgherrensis* a definite species of fungus grows on this gum, and has not been found elsewhere. The runners are characterised by large numbers of lenticels or air-holes, and a study of these has shown that their arrangement differs with the different species, while, by a study of their structure under the microscope, many species may be readily recognised. These are a few of the problems which confront the naturalist interested in this group, and add zest to the otherwise uninteresting collection of plants for the herbarium.

THE ROSARY.

THE RUGOSA ROSES.

HE who would have Roses in May should plant Rugosas, and not singly or dotted as a single plant here and there, but in hedges and surrounding the lawn or the Rose garden. Over a number of years they will vary but little in their time of flowering which generally begins on May 23 or 24, and from that time, being true perpetuals, they will continue with only a break in early July (when we can spare them) until autumn reddens their fine fruits, which remain to brighten the garden as long as the birds will allow them.

They are also delightfully fragrant, so much so that they will scent the air of the garden, and one at least, Mme. Georges Bruant, has a Sweetbriar scent in the foliage. It is a red hybrid Rugosa, Rose à parfum de l'Hay, that Mons. Jules Graveraux has, after many experiments, selected as the most fragrant of all Roses from which to make Rose perfume. Two of the earliest are *Thusnelda* and *Blanc Double de Coubert*, though this year they were preceded by one day by *America*. *Thusnelda*, once aptly described by Mr. G. L. Paul as "the first and the last Rose in flower," is a very pale, flesh-coloured variety, very full of petals, and very free in flowering. Some, like *Blanc Double de Coubert*, begin to flower again (though sparsely at first) almost before the first blooming is over, while a few, like *Conrad F. Meyer*, *Carmen* and

FIG. 51.—TREES OF *ACACIA MELANOXYLON* DESTROYED BY *LORANTHUS*.

reasons for this immunity of the Gum trees. In the first place, their lower branches are cast off in succession, sometimes loaded with germinating *Loranthus* seeds; in the second, the bark is constantly shed throughout the life of the tree and hangs in long strips, making it difficult for the *Loranthus* to lay hold, and, lastly, there is less temptation for birds to seek shelter under the open, straggling foliage. By their enormous growth the blue Gums are soon raised above the horizon of the smaller birds of the forest, but the Acacias, and especially the handsome *Acacia melanoxylon*, the Black Wattle, affords to birds a safe retreat after feeding in the recesses of its dark-green foliage. The Wattles are amongst the most beautiful trees on the hills, *Acacia melanoxylon* because of its shade and foliage and the bluer-coloured *Acacia decurrens* because of its masses of light and dark-yellow flowers. Both trees become infested with parasites. The Black

ally attacked by all the species of the neighbourhood, *L. cuneatus*, *L. neelgherrensis*, *L. intermedius*, and *L. tomentosus*, we find *Symplocos opicatus* harbouring *L. intermedius*, *Cinchona* only attacked by *L. neelgherrensis*, and *Dodonæa viscosa* only by *L. cuneatus*, while *L. tomentosus* has no special host. There are many cases, again, of *Loranthus* fixed on other species of the same genus, parasite on parasite, and one species of *Viscum* is hardly found at all, excepting on *Loranthus longiflorus* var. *falcata*. Then again there is the interesting speculation as to whether the kind of host affects the morphological development of the parasite, the leaves of the latter in some degree simulating the former. It has been shown that in an Assam Tea garden *Loranthus longiflorus* had leaves so like those of the Tea plants that they were regularly collected by the pickers with the Tea leaves, and imparted a curiously bitter taste to the Tea,

others, have distinct flowering periods, separated by times when there are no flowers on the plant. Mme. Ancelot, a very vigorous grower, is rather a shy bloomer, but the majority of Rugosa Roses flower well, and more or less continuously.

The Rugosa Rose came from Japan about 100 years ago, where, according to Lindley, it was known as the Ramanas Rose, but Lindley knew it only from Thunberg's description, which he found difficult to distinguish from that of *R. ferox*, the Hedgehog Rose. For garden purposes, at all events, the two have little in common save their hardiness. The Rugosa is one of the hardiest of all Roses, and its strong foliage allows it to flourish in the most exposed situations, so that it does well, even near the seaside. Unlike our native Dog Roses the Rugosas are not lovers of the clay, and flourish best where the soil is light and sandy, and I have seen them doing well in chalk districts.

Although they were introduced so long ago and seed so freely it was long before any great

Morlet produced *Fimbriata*, a nearly single Rose; the petals are white-tinted blush, and fringed at the edges like a Pink. The flowers are both pretty and distinct. In 1892 Cochet gave us *Blanc Double de Coubert*. This is still the best white form. The flowers are pure white, carried in clusters and semi-double. The variety blooms early and constantly; during the autumn fruit and flowers may be seen on the same bush. In the same year Nabonnand produced *Comte d'Epresmesnil*, a variety with double flowers of a not very pleasing violet-lilac shade, and Messrs. Paul & Son obtained a variety named *America*, with large, open flowers, something the colour of crimson-lake. I believe Mr. G. L. Paul told me this Rose was sent to his firm by Prof. Sargent. *Atropurpurea*, the best red variety, appeared in 1899; the flowers are deep maroon-red. Then, at the close of the century, appeared Conrad F. Meyer, the most distinct advance in hybrid Rugosas. It was obtained by crossing an unnamed Rose, the progeny of *Gloire*

Jacqueminot and *R. damascena* with *R. rugosa*; and Mrs. Anthony Waterer. In 1909 a fresh break appeared in Daniel Leseuer, a Rose with a distinct shade of yellow. From its habit it would appear to have *Gloire de Dijon* among its ancestors. The flowers are a pale, pinkish-yellow, the buds being a coppery-pink. They are well shaped, large, full and often beautiful. This variety also is constantly in flower. The habit of the plant, however, is rather straggling.

Of the varieties I have tried myself the following seem to me to be most worth growing:—White and Blush, alba, *Blanc Double de Coubert*, *Fimbriata*, Mme. Georges Bruant, *Nova Zembla*, and *Repens alba*; shades of pink: *Bienvenu*, *culocarpa* (for its berries), Conrad F. Meyer, *Delicata*, Mme. Ballu, Mme. Lucien Villeminot, *Mercédès*, *Thusnelda* (one of the best); Reds: *atropurpurea*, *Carmen* (bright and pleasing), *Le Cid*, Mrs. Anthony Waterer, *Rose à parfum de l'Hay*, *Souvenir de Pierre*, *Leperdrieux* (the last two are specially fragrant); Yellow: *Daniel Leseuer*.

The two faults of the Rugosas are that as a class the doubles are rather wanting in form, and they do not last well in water when picked. From the former defect Conrad F. Meyer and Daniel Leseuer are exceptions, so this may be remedied in time, but until the habit of drooping when picked and put into water is remedied we must regard them rather as Roses for the garden than for the dwelling room. *White Rose*.

ACIPHYLLA SQUARROSA.

THIS remarkable plant (see fig. 52) belongs to the natural order Umbelliferae, and is popularly known as the Bayonet plant. Each segment of the crowded mass of leaves bristles with a spear-like point, and in New Zealand it is said to form impenetrable thickets in sub-alpine districts. It is a decorative plant, and on bold rock-work, or as an isolated specimen, it makes a suitable evergreen plant all through the year. *A. squarrosa* is of very dense growth, making a mound of greyish leaves from 2 to 4 feet through. The radical leaves are 2 to 3 feet long, and two or three times pinnate. The leaflets are linear, not more than a $\frac{1}{4}$ inch broad, deeply striated, stiff, and leathery. The inflorescence is a queer-looking, spiny spike, about 4 feet high, composed of numerous umbels springing from the axils of spiny bracts. The bracts vary from $\frac{1}{2}$ to 1 inch broad; they are yellowish and sticky, tipped with three to five rigid spines, the middle one being the longest. The flowers are small and not showy. The plant figured is a female specimen; the male plant has a more spreading panicle.

The plant is apparently only propagated from seed, which is difficult to obtain in this country. Some say the *Aciphylla* dies after flowering, but this is not always the case; at Glasnevin, by cutting out some of the flower-spikes, the plants are retained, and, when in good health, they will live for many years, but do not flower annually.

The flower-stems are hollow, and have the characteristic Umbellifer smell. Both *A. squarrosa* and *A. Colensoi* yield an aromatic gum resin which was formerly used by the Maoris as a masticatory. *A. Colensoi* has broader leaves of a brownish colour, but at Glasnevin it has not formed so large a plant as *A. squarrosa*. Another species, *A. Traversii*, flowered this June at Glasnevin, throwing up a flower-spike about 2 feet high with greenish flowers. The leaves are not so rigid and are plain green, with curious, transversely-jointed leaf segments. It was raised from seeds obtained from New Zealand, but, although interesting, it is less interesting than *A. squarrosa*. The genus, except for two species which are found in the Australian Alps, is confined to New Zealand. The fruits are linear oblong in shape, rather like those of *Ligusticum*. C. F. Ball, Royal Botanic Gardens, Glasnevin, Dublin.

[Photograph by C. F. Ball.]

FIG. 52.—ACIPHYLLA SQUARROSA GROWING IN GLASNEVIN BOTANIC GARDENS.

advance took place. Thunberg seems to have introduced two forms; the first was the type, *Rugosa rubra*, which, at least as we now know it, appears synonymous with the form known as *Regeliana* (a view which has Crépín's authority), and perhaps also with *himalayensis*. The second was *Rugosa alba*, a white form. Towards the end of last century, however, some new varieties appeared. *Helvetica*, a form with trusses of white flowers, must have been one of the earliest, but I have been unable to ascertain the date. In 1837 came Mme. Georges Bruant, also white and semi-double, the flowers being produced more or less singly. It was a cross between Thunberg's *Rugosa* and the Tea Rose *Sombreuil*. From this point the tide of production began to flow. Three years later Dr. Müller obtained a variety, *Germanica*, which, though it seems to be lost to cultivation in this country, was the parent of many of the modern Rugosas. The next year, 1891, as the result of a cross between Mme. Alfred Carrière and *Rugosa* (type),

de Dijon and Duc de Rohan with *Rugosa germanica*. It is an extremely vigorous Rose, throwing up great shoots 8 feet high, densely armed with numerous prickles, which are persistent, and seta, which fall in the autumn. The foliage is large, dark-green, and strong, but unlike most of the Rugosas it is somewhat subject to mildew. The flowers are large, satiny-pink, with silvery-pink edges, well shaped and delightfully fragrant, but they do not last long as cut blooms.

Conrad F. Meyer has given rise to two sports, *Nova Zembla*, white or nearly so, and often good, and Mme. Lucien Villeminot, of a soft pink colour, which I prefer. It is rather more free-flowering than its parent, but not so thorny, and, though the flowers are not well shaped, their colour is, I think, very pleasing.

The number of the hybrid Rugosas is now considerable. Two of them have General Jacqueminot blood, *Rose à parfum de l'Hay*, obtained by crossing a seedling from General

THE FLOWERS OF CHAUCER.

(Continued from page 84.)

IVY.

1. He may go pypen in an ivy leef.
Knights Tale, I. 147.
2. Of erbe yve that groweth in our yerd, that
mercy is.
Nonne Prest his Tale, III. 220.
3. Pipe in an ivy leefe, if that the leste.
Troilus and Cryseyde, VI. 37.

Chaucer reckons the Ivy among medical plants, a virtue it has long lost; but the use of an Ivy leaf in the mouth as a musical instrument is still not uncommon.

LAUREL.

1. Hom he ryt anoon
With laurer crowned as a conquerour.
Knights Tale, I. 121.
2. Upon his heed he wered of laurer grene
A garlond freisch and lusty for to sene.
Ib. 159.
3. Eke on his heed a croune of laurer grene.
Ib. 180.
4. Box, chesteyn, lynde, laurer. *Ib. 182.*
5. Al my lymes ben as greene,
As laurer thurgh the yeer is for to seene.
Marchaundes Tale, II. 169.
6. Lauriol, century, and fumytere.
Nonne Prest his Tale, III. 220.
7. The victor palme, the laurer, too, divine.
Assembly of Foules, IV. 195.
8. At the laste I gan ful wel aspy
Where she sat in a fresh grene laurer tree.
Flower and the Leaf, IV. 240.
9. Chapelets . . . some of laurer.
Ib., IV. 242.
10. Chapelets newe made of laurer grene.
Ib., IV. 246.
11. And on their heddes, wel
Dressed, were crownes of laurer grene.
Ib.
12. Boughes shene,
Some of laurer. *Ib.*
13. The nightingale, that al the day
Had in the laurer sate. *Ib. 253.*
14. Alle they that of laurer chapelets beare.
Ib. 255.
15. Forth they yede
Unto a faire laurer that stood fast by.
Ib. 248.
16. The precious laurer so notable. *Ib. 256.*
17. And ferst to se the holy laurere quake.
Troilus and Cryseyde, V. 134.
18. Dane her self shet
Undur the bark, and lawrer wax for drede.
Ib. 141.
19. The laurer-crowned Phebus. *Ib., VI. 26.*
20. Under the laurer, which that may not fade.
Queene Anelyda and False Arcyte, VI. 180.
21. (Theseus) Laurer crowned in his chare.
Ib. 181.
22. With his tryumphe, and laurere crowned
thus. *Ib.*
23. Thou shalt se me go as blyve
Unto the next laurer I see,
And kysse hyt, for hyt is thy tree.
House of Fame, VI. 229.
24. And loken on these faire loreryes.
Romaunt of the Rose, VII. 57.
25. With many high lorey and pyn. *Ib. 59.*
26. I sawe the Daphene closed under rynde.
Complaynte of a Loveres Lyfe, VIII. 8.

In all these passages the Laurel is the Bay; the tree into which Daphne was changed and the crown of conquerors. What we now call Laurel was introduced into England many years after Chaucer, and was rightly called the Cherry Laurel, being not a Laurel but a Cherry.

LEEKES.

1. Wel loved he garleek, oynouns, and ek
leekes. *Prologue, I. 103.*
2. To have an hoor heed and a greene tayl,
As hath a leek.
Prologue of the Reeve, I. 217.
3. I hold a mouses hert not worth a leek.
Prologue of the Wyf of Bathe, II. 62.
4. Every man that holt him worth a leek.
Marchaundes Tale, II. 165.
5. And othere suche, deere y-nough a leeke.
Prologue of the Chanounes Yeman, III. 32.
6. Ful sade and caytif was she eek,
And al so grene as ony leek.
Romaunt of the Rose, VII. 20.
7. Sich love I preise not at a leke. *Ib. 165.*
8. If he be a nygard eke,
Men wole not sette by hym a leke.
Ib. 182.
9. Though they die, they sette not a leke.
Ib. 193.

LICORICE.

1. Clowe-gelofre, and lycorice.
Romaunt of the Rose, VII. 58.
2. Ther springen herbes greet and smale,
The licorys and the cetewale.
Tale of Sir Thopas, III. 119.

As Chaucer reckons Licorice among growing trees and herbs, I must give it a place.

LILY.

1. Emelie, that fairer was to seene
Than is the lilie on hire stalkes grene.
Knights Tale, I. 121.
2. An egle tame, as eny lylie whyt. *Ib. 159.*
3. Thou with thi garlond, wrought with rose
and lylie,
The mene I, mayde and martir Cecilie.
Secounde Nonnes Tale, III. 7.
4. (Cecilie) it is to say on Englisch, hevenes
lilie. *Ib. 9.*
5. Of good fame
The soote savour, lilie was her name.
Ib. 10.
6. This aungel had of roses and of lilie
Corounes tuo. *Ib. 13.*
7. And whan that he the savour undernom,
Which that the roses and the lilies cast.
Ib. 14.
8. Whennes this soote savour cometh so
Of rose and lilies, that I smelle her.
Ib. 14.
9. In laude as I best can or may
Of the and of thy white lily flour.
Prioresses Tale, III. 103.
10. Over that his cote-armour
As whyt as is a lily flour.
Tale of Sir Thopas, III. 124.
11. Upon his crest he bar a tour,
And therein stiked a lily flour. *Ib. 127.*
12. His nayles whitter than the lily flour.
Nonne Prest his Tale, III. 217.
13. And lily forehede had this creature.
Court of Love, IV. 159.
14. The lilie wexith, white, smoothe, and soft.
Troilus and Cryseyde, V. 50.
15. As whyte as lylie or rose in rys.
Romaunt of the Rose, VII. 46.

The Lily of Chaucer, as of all other writers of his day, is, without doubt, the pure white Madonna Lily.

LIME.

1. Chesteyn, lynde, laurer.
Knighytes Tale, I. 182.
2. To seke Gamelyn under woode lynde.
Cokes Tale of Gamelyn, I. 260.
3. Be ay of chier as light as lef on lynde.
Clerkes Tale: Envoye de Chaucer, II. 160.
4. Fyne ew, popler, and lyndes faire.
Romaunt of the Rose, VII. 59.

Line or Linden was the English name of the Lime tree from the earliest times. The present name Lime does not occur in English literature before Dryden.

LUNARY.

Egrimoigne, valirian, and lunarie.
Prologue of the Chanounes Yeman, III. 32.

Lunary was a name given to many plants of supposed magical powers in Chaucer's time, but later it was restricted to Honesty (*Lunaria biennis*) and the Fern Moonwort (*Botrychium lunaria*).

MAPLE.

1. Mapul, thorn, beech.
Knights Tale, I. 182.
2. Under a maple that is faire and grene.
Cuckow and the Nightingale, IV. 229.

Both name and tree have been in England from the earliest times: now chiefly as a hedge-shrub.

MARIGOLD.

1. And jealousy
That werud of yolo guldes a gerland.
Knights Tale, I. 150.
2. Eek eche at other threw the floures bright,
The primeroze, the violete, and the gold.
Court of Love, IV. 183.

Gold is the short name for the Marigold, a great favourite in all old gardens but the name is given to several different yellow plants, as the Marsh Marigold, the Corn and the Garden Marigold. Chaucer's may have been any of the three.

MEDLAR.

1. That ilke fruyt is ever lenger the wers,
Til it be rote in mullok or in stree.
Prologue of the Reeve, I. 217.
2. I was ware of the fairest medler tree,
That ever yet in alle my life I sie,
As ful of blossomes as it might be.
Flower and the Leaf, IV. 240.
3. The goldfinch eke, that from the medler tree
Was fled for heat into the bushes colde.
Ib., IV. 254.
4. Medlers, plowmes, perys, chesteyns.
Romaunt of the Rose, VII. 59.

The Medlar is not a native of England, but it was introduced into England very early, and, as an ornamental tree, it fully deserves all that Chaucer says of it in No. 2.

MINT.

Doun by a lytel path I fonde
Of mentes fulle.
Romaunt of the Rose, VII. 37.

MYRRH.

The myrre also that wepeth ever of kynde.
Complaynte of a Loveres Lyfe, VIII. 8.

Chaucer alludes to the fable of Myrrha changed into a tree.

NUTMEG.

1. And notemuge to put in ale.
Tale of Sir Thopas, III. 119.
2. And trees there were gret foisoun,
That baren notes in her sesoun,
Such as men notemygges calle,
That swote of savour ben withalle.
Romaunt of the Rose, VII. 58.

Though Chaucer spoke of Nutmeg trees, it is very certain that he never saw one; but the nut, with its pretty covering of Mace, was imported into England from the East long before his time.

NETTLE.

1. Full oft
Next the foule nettle, roge and thik,
The little wexith, white, smoothe, and soft.
Troilus and Cryseyde, V. 50.
2. Nettle in dokke out.
Troilus and Cryseyde, V. 196.
3. Thesteles sharpe of many maners,
Netles, thornes, and hokede breres.
Romaunt of the Rose, VII. 69.

See "Dock." H. N. Ellacombe, *Bitton Vicarage, Bristol.*

(To be continued.)

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

CHRYSANTHEMUMS IN TUBS OR LARGE POTS.

—I have previously advised the culture of the early-flowering variety of Chrysanthemums in large receptacles. Our plants are nearly 6 feet through, and the shoots have been trained apart to make shapely specimens. In another month the earliest varieties will be in flower. If large plants are not needed, smaller ones should be grown, and these will only require at the most three stakes. Avoid formality as much as possible in training the plants. Attend carefully to their watering, and never allow them to suffer from drought at the roots. Occasional doses of liquid manure will greatly assist them at this stage, and this stimulant may be given for a few weeks to come. All Chrysanthemums now require a close attention in watering, tying the shoots and keeping them free from aphids.

ROMAN HYACINTHS.—The earliest consignments of Roman Hyacinths have been received, and the bulbs are found to be of good quality. I prefer a heavy, solid bulb of medium size rather than an extra large one. Proceed as soon as possible to pot or box the first batch intended for flowering in October. For use as decorative plants in pots place three bulbs in a 4½-inch pot or six bulbs in a 6-inch pot, but if the blooms are required for cutting, as many as from 25 to 50 bulbs may be placed in a single box. Just cover the bulb with the soil, which should consist of sandy loam and leaf-mould. Successional plantings should be made to extend the time of flowering. Not more than one fifth of the stock of bulbs should be planted at one time, and the last potting should be done not later than the end of September. Place the pots in a cold frame and cover them with a layer of ashes about 3 inches deep; see that the ashes have been well exposed to the air for some time after removal from the stokehole. The lights need not be put on for two months at least, but the ashes may be watered.

NARCISSUS.—The first batch of early Narcissi may also be potted, for early potting means early rooting, and it is essential to secure an abundance of roots before forcing is attempted. Both the Double Roman and the Paper White Narcissi, of the Polyanthus section, are quite dependable and force easily. The old double-flowered Daffodil and Golden Spur are, in their section, the best to choose for early forcing. Both these may be had in flower by Christmas or the New Year, if they are started in growth early in the autumn.

PELARGONIUM.—The large-flowered section of Pelargoniums, represented by the Show, Regal, and spotted French varieties, should soon be pruned, if the work has not been done already. The plants should be placed on their sides for a time before the operation is performed in order to allow them a rest. Do not hesitate to prune severely, unless large specimens are desired. Some of the best cuttings should be reserved for purposes of propagation. They will root in the open if planted in a sunny situation, in loamy soil containing plenty of sand.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

COCHLIODAS AND THEIR HYBRIDS.—The genus *Cochlidia* is not a large one, the only known species being *C. Noezliana*, *C. rosea*, *C. sanguinea*, and *C. vulcanica*. These are, however, of considerable importance to the hybridist; crossed with *Odontoglossums*, they have given us the beautiful *Odontiodas*, and these include some of the most brilliant Orchids that have been raised. *O. Bradshawiae*, *O. Bohnhoffiae*, *O. Charlesworthii*, *O. Devossiana*, *O. Graireana*, *O. heatonense*, *O. keighleyensis*, *O. St. Fuscien*, *O. Thwaitesii*, *O. Vuylstekeae*, and *O. wickhamiensis*, may be mentioned as some of the choicer amongst them. They will all thrive in a cool, airy, and moist atmosphere, such as is suitable to the cool *Odonto-*

glossums. The plants should be grown in pots, placed on the stage, and kept well up to the light all the year through. In a suitable atmosphere, and under judicious treatment, they are not much subject to insect attacks, but every endeavour must be made to keep down thrip. This is a very troublesome pest to eradicate at this season, and if any thrip is detected, prompt measures must be taken to effect its destruction. Mild fumigations of a vaporizing compound at regular intervals and dipping the foliage in some safe insecticide are the best remedies. The plants are rather erratic in their time of growing and flowering; the majority are now making their growths for next year's blooming. If any plants are in need of fresh rooting materials, the cultivator should, if possible, anticipate the production of young roots from the developing growths, by placing some compost about them, as this will strengthen the plant materially and afford a firm hold in the new soil. Nothing is better for planting them in than fresh *Osmunda* fibre, broken into small lumps with the fingers; *Polypodium* fibre or Oak leaves, and clean, fresh *Sphagnum*-moss, three-parts of the *Osmunda* fibre to one each of the others. Add a little coarse sand and crushed crocks to the mixture, and stir the components well together. Small pots should be employed, as nothing is so fatal to these plants as overpotting, and the pots should be thoroughly well drained with clean crocks. In potting, set the plant so that the base of the pseudo-bulbs are slightly above the rim of the receptacle, pressing the compost firmly about the roots without bruising the latter, and finish off with a layer of fresh *Sphagnum*-moss, trimmed at the edges to present a neat appearance. The supply of water at the roots must be ample while the growth is active, and at no period should the rooting material be allowed to remain dry for any considerable length of time.

HOT-WATER SYSTEM.—The heating apparatus should be thoroughly overhauled and put in a proper working order ready for the winter. Leaky joints in the pipes should be made good, and the valves and air-taps made easily movable. The present season affords a suitable time for renewing old and worn boilers; if these are neglected they are almost sure to break down when extra strain is put upon them during cold weather in winter. Of the many good types of greenhouse boilers on the market, the best of the sectional kinds are to be recommended.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

PROPAGATING BEDDING PELARGONIUMS AND FUCHSIAS.—Cuttings of bedding Pelargoniums may be inserted forthwith, taking care to select the shoots where they will not be missed in the flower-beds. Vigorous plants are the better for being thinned, especially close-growing varieties, with shoots that are crowded in the centre. But the taking of cuttings from such sorts as Paul Crampel, Univers, and the popular Henry Jacoby needs to be done judiciously, or their removal from the plants will be noticed for some time afterwards. The shoots will be firm and well ripened this season, and should strike readily. It is a good practice to allow the cuttings to wither for a day or two after they are trimmed before inserting them in the cutting boxes or pots. It is also well to place the boxes on a trellis-work staging, in case heavy rains should fall before the cuttings are rooted. Ivy-leaved Pelargoniums root much more freely than the Zonal-leaved varieties: they should be treated in the manner advised above. Allow for failures by inserting a fair percentage above the numbers required of all kinds. Cuttings of Fuchsias may also be inserted now. Soft shoots are the best for the purpose, and to preserve them in a fresh condition, they should be placed in a pan of water till wanted. They root successfully in an ordinary cold frame, kept close and shaded from the sunshine; but they need to be sprayed frequently to prevent them from flagging. Cuttings, if inserted at this season, will, if they are treated properly, provide good flowering plants by the time they are wanted next June. It seems to be the custom to insert cuttings of bedding *Violas* about this time, but two months hence is quite soon enough for these, and the shoots at that time are superior for the purpose to any

that can be had now. These later cuttings will root in time to form splendid plants for summer and autumn blooming.

ASTERS.—Black leg disease has been very prevalent amongst the Ostrich Plume varieties of China Asters this season, although the other kinds are scarcely affected. No fewer than 200 plants have already been replaced with fresh stock. Sheep dip, in solution, which is composed mainly of carbolic acid, is said to be a valuable specific for black leg. Hitherto, I have refrained from using this substance, mainly because that which is harmless to vegetation on some soils might prove injurious on the very porous soil in which Asters are growing here.

DIANTHUS BARBATUS (SWEET WILLIAMS).—The blooming of these flowers being almost over, the old flower-spikes should be cut down close to the ground, preserving, however, the growths which proceed from their base, should the plants be considered worth keeping. After the spikes are cut, apply some light soil about these basal shoots, so that roots may develop and form plants that may be either transplanted before the autumn or left where they are to flower next year. The bare spaces in the beds should be filled meanwhile with some other plant in or just about to flower. Soak the plants with water to enable them to produce new roots immediately. Pinks of such varieties as Mrs. Sinkins and those of the plumarius and superbus types, which root in the same way as Sweet Williams, should also be trimmed, and have soil applied in the same manner to induce the production of stem roots before the autumn, when the plants may be pulled to pieces, and each piece replanted with its newly-formed roots. The florists' varieties of Pinks will now be rooted, and the layers should be transplanted before the roots become entangled in the soil. It is usual to place them in lines a few inches apart till beds can be got ready for them next month.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

PARSLEY.—The plants raised from seed sown a month ago should be ready for thinning. Those removed from the rows may be planted in some sheltered position, where they may be covered with box frames during cold weather. The ground selected for the transplanted seedlings should be rich, but not of a light texture, and the soil should be trodden before the plants are put out. If the seedlings are planted at 8 inches apart, they will have room to develop into good strong plants before the season is far advanced. Give liberal supplies of water at the roots, and, when the plants have grown to a good size, they should be cut close to the ground to procure a stocky growth. Frequent light dustings of soot may be given to Parsley with advantage.

CELERY.—Give liberal supplies of water to the roots of Celery plants throughout their growing season in order to promote a clean, healthy growth. After a copious watering has been applied, the surface soil should be stirred with a hoe in order to loosen it and keep down weeds. The earliest plants should be further earthed up as soon as the leaves are of a sufficient height above the soil which was placed about them a short time since. Great care should be exercised that none of the soil is allowed to fall into the centres of the plants. Neither should it be pressed too tightly, as the centre leaves need room to develop.

LEeks.—Further plantations of Leeks may be made now to provide supplies next April and May. The plants should be allowed a distance of 1 foot between the rows and 8 inches in the rows. Give plenty of clear water to the roots until they are established, and keep the soil loose by hoeing frequently. Leeks planted early in the season should be watered freely with liquid manure, and have a little soil placed around the stems as growth advances. The Leek is a gross feeding subject, and, unlike most vegetables, the largest specimens have the mildest flavour, therefore endeavour to grow them as large as possible.

TOMATOS OUT-OF-DOORS.—If the plants have been restricted to single stems, there will be little difficulty in securing a good crop of fruits. As soon as four or five trusses are set

on each plant, the top of the shoots may be pinched out, and all side shoots and worthless leaves removed. The surface soil should afterwards be pricked over with a fork, and a dressing of artificial manure applied and washed into the bed with clear water. Tomato plants intended to furnish a supply of fruits in the early winter, should be ready for potting into their fruiting pots. Turfy loam and a sprinkling of leaf soil will form a suitable rooting medium. Pot moderately firmly and allow room for top-dressing to be applied towards the end of the season, when sufficient fruits are set. The plants may be grown in the open until the fruits have formed, unless wet weather sets in, when they should be placed under cover in some well ventilated house, but leave the lights open night and day as far into the autumn as circumstances will permit.

SPINACH.—It is still necessary to make frequent sowings of Spinach in order to maintain a daily supply. Choose a border with an eastern aspect so that the plants may escape the afternoon sun. Give daily waterings with clear water as soon as the sun's rays are off the border. Winter Spinach may be sown in quantity in order to produce a good supply in the cold weather. Sow in shallow drills, drawn at 15 inches apart, and, if the ground is dry, pour water into them the night previous to making the sowing.

LETTUCE.—Prick off seedling Lettuces as soon as they are large enough to handle and before their roots have reached to any considerable depth in the soil. Plant in a shady situation. While dry weather continues the plants should be frequently damped in order to hasten their growth. Make a sowing of Lettuce seeds weekly throughout August, choosing a border facing west, where the plants may be protected from east winds in early autumn.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

WALL FRUIT.—Apricots are ripening their fruits, which should be exposed to the sun's rays as much as possible. Keep the leading branches trained to the wall, and stop all fore-right shoots close to the main branches. Peaches and Nectarines that have developed strong shoots must receive proper attention to enable the growths to become thoroughly ripened. All shoots not required for bearing next year should be removed at once, particularly the gross-growing ones that are not required for furnishing vacant spaces. Thin out the weaker growths so that those that remain are exposed fully to the light and air. Should red spider or mildew appear on the trees, carefully dust the affected parts with sulphur, as advised in a previous calendar, but avoid syringing the foliage with insecticides whilst the fruits are present on the trees. Morello Cherries need to be protected by nets until they are gathered.

BUSH FRUIT.—Either destroy at once or mark for destruction later any bushes that are inferior in any way, for if this is neglected until the leaves have fallen they will be difficult to identify, and mistakes may be made. Keep the ground between the bushes well hoed, especially where the plants have been attacked by caterpillars. If this is done, there will be less likelihood of caterpillars appearing than if the soil is not disturbed. Indeed, in some places where the ground is kept well hoed, caterpillars are not seen for years together. Avoid planting anything near the bushes which will prevent the soil being stirred frequently.

APPLES AND PEARS.—These fruits have been greatly benefited by the recent rains, and are swelling fast. The Apple and Pear crops are more satisfactory than was expected earlier. In these gardens, whilst some Apple trees have no fruit, others have a fair number. It is interesting to observe that, whilst young trees of Blenheim Pippin are fruiting fairly well, older-established trees are bare of fruit. Of dessert Apples, American Mother, Baxter's Pearmain, Beauty of Bath, Brownlee's Russet, Cox's Orange Pippin, and Sturmer Pippin are carrying fair crops; whilst the following cooking varieties are satisfactory:—Ecklinville Seedling, Bismarck, Blenheim Pippin, Hawthornden, Lane's Prince Albert, Lord Grosvenor, Schoolmaster,

The Queen, Warner's King, and Northern Greening. Many varieties, including some of the newer sorts, such as Allington Pippin and Charles Ross, also Lady Sudeley, Lady Henniker, Hoary Morning, Newton Wonder, and Sandringham, have failed altogether this season. With well-ripened wood, most of these will, in all probability, fruit satisfactorily next season. Attend to the removal or stopping of all superfluous growths, so that the shoots and spurs which will bear fruit next year may have all the sunlight and air possible. Fruit trees of all kinds are now fairly free from insect pests, and, with favourable autumn weather, the wood generally should be well ripened. Where wasps are troublesome, the nests should be searched for and destroyed. Cyanide of potassium is one of the surest and quickest agents to employ for the extermination of these pests, but great care must be exercised in its use, as it is a very poisonous compound. If a small piece of the cyanide is placed in the hole leading to the nest, and the entrance afterwards covered with a clod of earth, it will usually exterminate the whole colony, after which the nest may be dug out and destroyed.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

POT VINES.—The wood of pot vines intended for early forcing is almost ripened, for the recent spell of fine, sunny weather has been entirely in the plants' favour. If the vines are not already stood out-of-doors, they should be placed in an open, sunny position outside and made secure against the wind. Watering must be done carefully, as the plants, having matured their growth, require very little moisture, but the soil must not be allowed to become excessively dry. Pinch out any lateral growth, and allow the foliage to fall naturally.

PEACHES AND NECTARINES.—It has been a difficult matter of late to retard any trees with fruits approaching ripeness, and in many instances the fruits have matured too quickly. Trees carrying the latest crops of these fruits will need all the fresh air it is possible to afford them, both by day and night, and a slight covering placed on the glass during the day. Where the material that was applied to the borders as a mulch has become exhausted, apply a further thin covering of horse-droppings. This mulching will prove helpful to Peach trees in all stages of growth. As the crops are gathered, and if the wood is too thick, some of this year's fruiting shoots may be removed with a sharp knife, but otherwise I prefer to leave any pruning until the winter. See that the trees do not suffer for lack of water, as more than one cause of failure in the spring is, I believe, attributable to dryness at the roots at this season. Give the foliage a thorough syringing at least once daily, except those trees that are carrying ripe or nearly ripe fruits. The use of fire-heat during the present hot weather is quite unnecessary.

GENERAL REMARKS.—Contrary to last year's experience, wasps have this season been much in evidence, and they are spoiling all out-of-door crops of fruits, including the few green Apples we have. We have made a careful search for their nests, and destroyed nearly one hundred in the immediate vicinity. Wasp-proof netting should be placed at once over the ventilators and other apertures in all houses containing fruit. Bunches of Grapes may be enclosed in muslin bags, but I prefer the use of wasp-proof netting. Examine bunches of ripe Grapes at intervals for shranked or otherwise defective berries. The permanent rods of early vines may have the lateral growths removed where the vines are in good order, as this will assist in ripening the growths that remain. Attend carefully to the watering of pot Strawberries that have only recently been transferred to the fruiting pots. Remove all runners and weeds, and, as the plants require it, afford increased space. The loam and other ingredients required for the making and top-dressing of borders should be got in readiness, and, where the loam is liable to infection by wire-worm, a quantity that has been charred, should always be kept in stock. This will be especially useful for potting purposes and the formation of Melon beds, etc. At

Aldenham we use rough firewood for the purpose of sterilizing soil by baking, building it up in a ridge, and placing the turves grass side downwards to smoulder for several hours. A good supply of charcoal may be obtained in this way, which will be useful for potting and other purposes.

THE APIARY.

By CHLORIS.

BEES AND WATER.—Brooks and ponds are, in many parts, quite dried up, and the natural water supply being very scarce, it is necessary for the beekeeper to provide plenty of clean water for his bees. Several methods were advised in my notes for May 20, any one of which may be resorted to now.

WASPS.—In some apiaries wasps are already a great source of trouble, and weak colonies of bees will be easily destroyed by them; where this is the case, unite the weaker colonies by drawing the hives gradually towards each other, moving them about a yard each day when the bees are on the wing, until they stand side by side. After this is accomplished, give each colony, in the late evening, a good puff of smoke to make the bees gorge themselves with food, so that they may be the more easily united. Having settled which hive is to be the future home (it would be better to utilise a perfectly clean hive), take the combs covered with bees and either use the flour dredger, giving all the bees a light covering of flour, or spray them with peppermint water to give them the same scent. Perform the same operation in the other hive, then place the combs of brood from each hive alternately, giving more than the usual space to prevent fighting; combs of sealed food may be inserted the next night, when the frames may be properly spaced. It is best to use some scented water in preference to flour, because the bees will cleanse themselves of flour and store it as pollen, and usually bees have more than enough of this food. The entrances of all hives badly attacked should be narrowed so that one bee only can pass at the same time. In some instances heavily-laden bees, which do not quite reach the alighting board, are attacked on the ground and the bodies severed, the wasps carrying away the abdomens. It is an easy matter to destroy wasps when their burrows are found by placing a small piece of cyanide of potassium at the entrance. The poison and the surrounding soil should be slightly moistened with water. At night remove the dead wasps with a stick and remoisten the cyanide. Next morning repeat the operation, and at night the nest may be dug out.

TIME OF MANIPULATION.—Some beekeepers use far more smoke than is necessary when examining their hives, thus irritating the bees, causing endless stings and trouble. During cold and stormy weather and when honey is scarce, are the worst times to open the hives. Some beekeepers do not puff smoke in at the entrance, believing that it only drives bees upward, where they are not wanted. As the quilts are rolled back, slight puffs only are given as the bees require to be driven back. Very little expert knowledge is necessary to know when bees are spiteful and intent on stinging; they fly at the operator in a determined manner and with a loud buzz that cannot be misunderstood. To prevent bees from creeping up the sleeves use a pair of elastic bands or a pair of gauntlets that will grip the wrists firmly. Instead of the smoker, some experts prefer an atomiser, which will send a fine spray of dilute carbolic acid over the bees. The solution is made by using 20 parts of water to one of Calvert's No. 5 carbolic. A third method is the carbolic cloth, which was first used by a skilled and enthusiastic beekeeper of considerable repute, who was noted for his gentleness. Cut a piece of calico the size of the top of the frames 17 or 18 inches square, make a solution of carbolic, using one of carbolic to two of water, sprinkle the cloth, just perceptibly damp, roll it up and place in a tin box and it is ready for use. As the quilts are rolled back, unroll the carbolic cloth, and after a few seconds it may be taken off and the hive examined. As soon as the bees rise draw the cloth over the frames. Another advantage of using carbolic is that it is a good disinfectant and a preventive of foul brood, but it will cause the skin to blister, and must be used with caution.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 12—
Green and District Fl. Sh.

MONDAY, AUGUST 14—
United Hort. Benefit and Prov. Soc. Com. meet.

TUESDAY, AUGUST 15—
Roy. Hort. Soc. Coms. meet (no exhibition). Roy. Oxfordshire Fl. Sh. American Gladiolus Soc. Sh. at Baltimore, U.S.A. (4 days). North of England Hort. Soc. Sh. at Harrogate.

WEDNESDAY, AUGUST 16—
Hemel Hempstead Fl. Sh.

THURSDAY, AUGUST 17—
Roy. Hort. Soc. of Aberdeen Sh. in Duthie Park, Aberdeen (3 days). Deal, Walmer & Dist. Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62°·2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 9 (6 P.M.): Max. 97°; Min. 67°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 10 (10 A.M.): Bar. 30°·3°; Temp. 77°; Weather—Sunshine.

PROVINCES.—Wednesday, August 9: Max 91° Cambridge; Min. 58° Ireland N.W.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Special Sale Liliun Harrisii, Roman Hyacinths and numerous other bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 2.

The Heat and Drought.

Few people outside the ranks of professional gardeners realise the enormous amount of labour and the acute anxiety which are entailed by a spell of weather such as we are experiencing at the present time. The continued drought and fierce heat are enjoyable topics of conversation to those who sit on sandy beaches fanned by the cool breeze from the sea, but they are exasperating subjects not fit for conversation to those whose work confines them to the hot air ovens of London or any great town. Yet, even for them, drought merely spells, for the most part, discomfort and not disaster. It is, we fear, often otherwise in the garden, where, despite the employment of all modern resources of mulching and the use of sprayers and spreaders and watering pots, choice specimens are flagging, leaves falling prematurely, fruit failing to swell, and trees are dying. Nowhere have the labour and the anxiety entailed by the drought been felt more acutely than at Kew. In those great gardens, in spite of the watering being carried on night and day, many shrubs are suffering, and not a few Beeches and other trees have already succumbed. Some idea of the enormous labour entailed upon the staff by this almost unprecedented period of drought and fierce sunshine may be gathered from the fact that, last week, upwards of one and a half million gallons of water were used in that establishment. When it

is remembered that, with very brief intermission, the drought has extended for six or seven weeks, it will be understood how even such a liberal allowance as this may fail to meet the requirements of the thirsty soil. Nearly a month ago, on July 13, it was found necessary to use nearly half a million gallons of water in these gardens. The water is pumped from the Thames into reservoirs situated on high ground in Richmond Park, whence it is distributed to the various parts of the grounds. With respect to the temperatures which have been recorded, we may mention that on Wednesday, the 10th, the maximum sun temperature at Kew was 114°. In the frame-yard the shade temperature had already reached 80° at 9 o'clock, and by 1 o'clock it had established the record of 97°. These indeed are records which we could well do without, and even at the expense of hurting the feelings of those who are bent on holidays, no gardener can refrain from expressing the ardent hope that we may soon be blessed with "the gentle trouble of the rain."

School Gardens in London.

At a meeting of the London County Council on August 1 the Education Committee reported that they had had under consideration the general question of school gardens. There are already about 171 of these gardens in or adjoining the playgrounds of public elementary schools maintained by the Council. Sixty applications for the formation of school gardens had been postponed pending a decision on the general question. The school garden is used in connection with the teaching of botany and also in conjunction with the observation- and nature-study lessons which are included in the curriculum of the majority of the elementary schools.

Formerly, the subject of nature study was confined almost wholly to infants' schools, but it is now taking an important place in the work of the senior departments. Although the gardens at many of the schools have been formed for some time, the experiment of utilising them for nature study is a comparatively recent one. At first they were used for decorative purposes only, but the advantages of obtaining first-hand information on many points connected with nature-study lessons and of providing specimens for instruction in botany have induced many teachers to take considerable interest in the gardens and to utilise them in connection with the school work. Several of His Majesty's inspectors have suggested from time to time that it would be an advantage if the garden plots could be arranged in the playgrounds, and the Council's district inspectors are unanimously of opinion that school gardens are of high educational value and deserve the utmost encouragement by the Council. Having regard to all the circumstances the Education Committee are of the opinion that it is desirable that gardens should be provided wherever the conditions are favourable.

There are, continues the report, various points to be borne in mind in deter-

mining each application for the formation of a garden. The committee regard it as essential in each case (a) that the initial cost should be reasonable, (b) that the teachers should be desirous of having a garden, (c) that the size of the playground should admit of a garden being provided which would not unduly encroach on the space required for games, or that land should be obtained near the school, and (d) that the teachers should be qualified to undertake the management of the garden. They propose that a selection should be made from the applications now before them and that during the next few years about twenty gardens should be formed each year in connection with the existing schools. They were advised that many of the 171 school gardens at present in existence were remarkably well cultivated, but that others did not afford the full educational advantages of which they were capable—partly owing to lack of knowledge on the part of the cultivators, and partly because of want of means. On several occasions they had had under consideration the question of transferring the management of the gardens to the Parks and Open Spaces Committee, but that Committee has expressed the opinion that it would not be practicable for the work to be carried out in an economical manner by the Parks department. They were convinced that if the gardens are to be successful, it is essential that the school teacher should have the management of them, on the understanding that, when desired, he or she should be enabled to have the advice of the officers of the botany dépôt. They therefore propose that the management of the gardens should be entrusted to the schoolmaster or head-mistress of the schools.

The average cost of forming a school garden was about £15, so that if twenty additional gardens were formed each year the cost would be about £300. They could not at present estimate the total number of gardens which should be formed in existing schools, but it is not anticipated that the number will exceed one hundred. When they had been arranged the cost of the total upkeep would be about £75 a year, £25 for tools and £50 for seeds. Garden beds would be formed at new schools where the conditions are suitable and where the head teacher is desirous of such facilities.

The Education Committee recommended the Council to vote £300 for the formation of school gardens and this was agreed to.

The Finance Committee in reporting on the proposal said that they had carefully scrutinised it, as the policy which was being pursued might lead ultimately to considerable expenditure. The necessity of providing these gardens "as an experiment" was not apparent, as there were already 171 gardens in connection with schools, but after careful consideration the Finance Committee were prepared to concur in the provision up to the expenditure now in question, on the understanding that the limitations laid down were strictly observed. Any departure from such conditions would necessitate the reconsideration of the whole scheme.

KIGELIA PINNATA, WITH FLOWERS AND SUSPENDED FRUITS, IN THE SAJJAN NIWAS GARDENS, UDAIPUR.

OUR SUPPLEMENTARY ILLUSTRATION represents a tree of *Kigelia pinnata* growing in the Sajjan Niwas Gardens, Udaipur, India. Mr. STORER, the superintendent of the gardens, has been very successful in obtaining seeds by artificial pollination, and the specimen figured in the illustration is a young tree which has reached the fruiting stage. As will be seen, the fruits, which are borne on the old wood, hang down like candles, 2 feet long, suspended by yet longer stalks. *Kigelia pinnata* is a native of Africa, whence it has been introduced into many parts of the Tropics. It is a member of Bignoniaceæ, and forms a large and striking tree.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.—The revised schedule for the International Exhibition, to be held at Chelsea, in May next, is now ready for distribution, and copies may be obtained, post free, from T. GEOFFREY W. HENSLOW, Secretary, Royal International Horticultural Exhibition, 7, Victoria Street, Westminster. A preliminary schedule was distributed some months ago for the purpose of affording exhibitors some indication of the general nature of the competitive classes, but it was not possible at that time to enumerate the awards. These latter include presentation cups offered by His Majesty the KING, the Duke of PORTLAND (President of the Exhibition), and others, also a large number of gold and silver medals. In some of the more exacting classes money prizes accompany the medals, in order that exhibitors may be compensated for expenses necessarily incurred. The present schedule contains this information, and it is therefore indispensable to those who contemplate making contributions to the show. R. Hooper Pearson, Hon. Press Secretary.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.—At the exhibition of this society to be held on the 15th inst., at Harrogate, in the cricket field next to the Harrogate Agricultural Society's field, delegates from the Royal Horticultural Society will award R.H.S. medals. Lord FABER has offered a challenge cup for the best exhibit staged by an amateur employing a regular gardener. Mr. W. PENROSE GREEN and Lady KATHLEEN PILKINGTON have also offered challenge cups. The show will open at noon and close at 6.30 p.m. Judging will commence and committees will meet at 11 a.m. The official list of awards will be made at 3.30 p.m., when the cups, to be held for one year, will be presented to the winners by Lady KATHLEEN PILKINGTON. The National Hardy Plant Society offers special prizes for a "circular bed of hardy plants of not more than three kinds, not less than 6 feet nor more than 8 feet in diameter, to demonstrate their value for bedding."

VISIT TO A SEED NURSERY.—Messrs. JOHN K. KING & SONS recently invited members of the gardening Press and others interested in seed-raising to inspect the trials at their various seed farms, situated between Coggeshall and Chappel. The first place visited was Robin's Bridge, Coggeshall, where a trial of 213 varieties of garden Peas is being conducted. The visitors were also shown trials of Lettuces, Onions, Cabbages, Carrots, Broccoli, Radish and Beet, as well as farm crops, including Mangel, Sugar Beet, Swede, Turnip, Wheat, Barley, and Oats. Altogether the crops under cultivation for seed purposes at the various farms included 284 acres of Swedes and Turnips, 178 acres of Mangels, 280 acres of Wheats, 230 acres of garden Peas, 20 acres of garden and field Cabbages, 120 acres of Oats and Barley, 24 acres of Radishes, 18 acres of Onions, 12 acres of Carrots, 18 acres of garden Beans, and 16 acres of Kohl Rabi.

THE KING'S PRESENT TO A GARDENER.—His Majesty the KING has presented a gold and jewelled scarf pin to Mr. WILLIAM SMITH, the superintendent of the gardens at Holyrood Palace, as a token of his appreciation of the condition of the gardens and grounds at Holyrood on the occasion of the recent visit of the KING and QUEEN to Edinburgh.

NATIONAL HARDY PLANT SOCIETY.—The National Hardy Plant Society is arranging a conference to be held at Shrewsbury on August 24, the second day of Shrewsbury flower show, when papers on important subjects will be read and discussed. All members and prospective members of the Society are invited to attend. Full particulars may be obtained from the hon. secretary, Mr. FRANK BOUSKELL, Market Bosworth, Nuneaton.

EXHIBITION OF GLADIOLI.—In the Palm Court at Messrs. SELFRIDGE'S, Oxford Street, London, on the 2nd, 3rd, and 4th inst., a display of about 1,000 spikes of Gladioli was made by Messrs. KELWAY & SON, Langport. The flowers proved a great attraction to visitors, there being large spikes of some of the finest sorts of this beautiful flower.

ROYAL VISITORS AT A DUTCH NURSERY.—On Monday, July 24, H.R.H. Prince HENRY OF THE NETHERLANDS, paid a visit to the Royal Moerheim Nurseries, Dedemsvaart, Holland. His Royal Highness, who arrived by motorcar, was welcomed by Mr. B. RUYS and his brother Mr. L. A. RUYS, and immediately the company started to inspect the grounds. The Prince examined with much interest the several specialties of Mr. RUYS' nursery. The fields with Delphiniums, Phlox, &c., which were in full flower, attracted the attention of His Royal Highness, and he expressed admiration of the culture of the Conifers, Rhododendrons, Hollies, Roses, &c. Mr. RUYS had prepared a show of cut flowers. Two tables were covered with 360 vases of flowers, among which were 50 varieties of Roses, including Rayon d'Or, Juliet, Lady Hillingdon, and Miss Alice de Rothschild.

"THE BOTANICAL MAGAZINE."—The issue for July contains illustrations and descriptions of the following plants:—

VIBURNUM RHYTIDOPHYLLUM, tab. 8382, figured and described in *Gardeners' Chronicle*, June 30, 1906, p. 418. The plant is very ornamental in September when covered with its red berries, which ultimately turned black.

SPIRÆA VEITCHII, tab. 8383.—This species was described by Mr. HEMSLEY in *Gardeners' Chronicle*, April 25, 1903, p. 258. Plants in Messrs. VEITCH'S Coombe Wood Nursery have formed growths 6 to 8 feet long in a single season. These shoots are barren the first year, but the following season they develop axillary branches.

DRACOCEPHALUM ARGUNENSE, tab. 8384.—The genus *Dracocephalum* includes two closely-allied species, *D. Ruyschiana* and *D. austriacum*. *D. argunense*, which was regarded by the late Professor GRAY as a variety of the *D. Ruyschiana*, was named and figured in the *Gardeners' Chronicle*, August 9, 1878, p. 167, as *D. Ruyschiana*, variety japonicum. The species has long been cultivated in gardens, having been introduced in 1822. Mr. W. PURDOM, whilst plant collecting for Messrs. J. VEITCH & SONS, sent seeds from Weichang, in Northern Chili, and the plants raised therefrom furnished the material for illustration in the *Botanical Magazine*.

CUCUMIS METULIFERUS, tab. 8385. This species is a native of Tropical Africa, and produces brilliant, scarlet fruits, which remain on the plants for a long time, and are very ornamental. Specimens grown in the Tropical Aquatic house at Kew, in company with other gourds, produced a most beautiful effect.

CYPRIPEDIUM SPECIOSUM, tab. 8386.—This species has been in cultivation in this country under the name of *C. macranthum*, of which it is undoubtedly a near ally, but the original *C. macranthum* has flowers of a deep rose-purple shade. In *C. speciosum* they are pale flesh-colour veined with rose. The cultural conditions suitable for *C. macranthum* are also suitable for *C. speciosum*.

A NEW IMPATIENS.—In the *Kew Bulletin*, 1911, p. 249, Sir JOSEPH HOOKER describes a new Balsam with peltate leaves, under the name of *Impatiens peltata*. It is a native of the Malay Peninsula, and was discovered by Mr. D. T. GWYNNE VAUGHAN, Professor of Botany at Belfast. Sir JOSEPH HOOKER states that it is the only species known to him having peltately attached petioles, and a stiff, sub-erect spiniform spur. It is a fleshy herb 9 to 12 inches high, bearing few, solitary, pink flowers, less than an inch in their greatest diameter. A second species, *I. Vaughanii*, described in the same place, is remarkable in the colouring of the flowers, described by the discoverer as: "Lower two perianth segments greenish yellow; tubular process cream yellow; other segments deep violet to purple."

PUBLICATIONS RECEIVED.—*Journal of Botany*. (August.) (London: West, Newman & Co., 54, Hatton Garden, E.C.) Price 1s. 6d.

SWEET PEAS AT WISLEY.

SPLENDID plants of Sweet Peas have been grown in the gardens of the Royal Horticultural Society at Wisley this season—one of the driest on record—notwithstanding the light character of the soil. At the time of our visit, the clumps, 70 in number, were about 7 feet tall and 4 feet in diameter. The plants had a large crop of flowers of excellent quality, the footstalks being quite 1 foot in length, and many of the spikes bearing each four blooms. The ground was trenched early in February to the depth of 2 feet 6 inches, cow manure and a little lime being added. The seeds were sown under glass early in February in 3-inch pots, filled with ordinary garden soil, four or five seeds in each pot. Soon after germination the pots were stood out-of-doors on a warm border, and planted in their permanent quarters on March 15. Four potsful were planted in a circle to form a clump. Hazel sticks were used as supports, one in the centre and three or four round about each clump. The plants were kept well watered, and in June were mulched on the surface with a layer of rotted manure.

It may well be asked what is the secret of such fine success on a dry soil, in a situation exposed to blazing sun all day. Clean, rational culture, without any attempt to force growth by the aid of artificial manure is, I consider, the secret. A deputation of the Floral Committee examined the Sweet Peas recently and gave a number of awards and recommendations (see p. 96). The merits of the respective varieties as decorative plants were considered, i.e., plants which, while being good in habit and floriferousness for garden decoration, also furnished flowers of pleasing form and shades for use as cut blooms. Half-a-dozen of the best included Nubian, a large, dark-maroon variety; Asta Ohn, an excellent strong-growing lavender-coloured root; Dobbie's Sunproof Crimson, Elfrida Pearson, pale-pink and white, giving some flowers with double standards; Isobel Malcolm, pale-cream; and Etta Dyke, pure white. Visitor.

IPOMŒA RUBRO-CŒRULEA.

THE genus *Ipomœa* is represented in gardens by about half-a-dozen beautiful and well-marked species. If we had to deal with no more than these there would be little difficulty in tracing the history and descriptions of garden *Ipomœas*. Botanists fix the number of known *Ipomœas* at between 300 and 400 species, including with them the genera *Quamoclit*, *Batatas*, *Pharbitis*, *Calonyction* and *Exogonium*, as well as many of the plants usually known as *Convolvuluses*. The majority of the species are ornamental and

this beautiful *Ipomœa* will be new to many, yet it has been known in English gardens for more than 70 years. It is a native of Southern Mexico. Valuable as is the plant under glass, its merits are most apparent in the open garden, and it has always been a matter of the greatest surprise to me that so few employ this *Ipomœa* for the adornment of their gardens during the summer and early autumn. Last year I had six plants growing against a south-west wall 12 feet high. Wires were strained perpendicularly up the wall at a distance of about 2 inches from the brick-

will be about 2 feet high and carrying flower-buds. The soil close to the wall should be taken out to a depth of 8 inches and a width of 1 foot. The holes should be filled with a compost composed of one-half well-rotted manure from a spent mushroom bed and one-half leaf-mould and fibrous loam. Sufficient room should be left to receive the ball of earth and roots when the plants are turned out of their pots, and this operation needs to be done very carefully, so that the mass may not be broken. The soil should be pressed lightly around the roots and a copious watering given. Every evening, if rain has not fallen during the day, the plants should be syringed copiously. A resident in the United States, writing of this *Ipomœa*, states: "This grows luxuriantly in warm, sunny places out-of-doors, but I do not think your English summers are long enough for it to bloom in the outside garden, and, therefore, you had better treat it as an indoor vine." How mistaken he was is proved by the accompanying illustration. Last year the plants bloomed splendidly, from 40 to 50 blossoms expanding every morning, and on one occasion there were 72 flowers. They made a beautiful picture and were greatly admired by visitors. Unfortunately, the flowers fade soon after noon, and in the afternoon are closed and turn pinkish-red, this being probably the reason for the name "*rubro-cœrulea*," but when the flower is fresh it is of a lovely pale blue colour. The plants commenced to bloom the second week in July, and fresh flowers continued to expand every morning until nearly the end of September, after which no more expanded, though there were hundreds of buds. The individual flowers measure 4 inches across, and supply a tint that is absolutely unique in the summer garden. I have grown this plant for five years consecutively, and even in wet summers it has always been a success. Wyndham Fitzherbert.

FIG. 53.—IPOMŒA RUBRO-CŒRULEA: FLOWERS PALE BLUE.

many of them quite distinct from the few that are in cultivation. They are remarkable for the beauty of their flowers, which, though fugitive, are developed in such abundant and rapid succession as to keep up a rich display of blossoms for several weeks or even months. *Ipomœa rubro-cœrulea* (see fig. 53) is one of the most beautiful of all annual climbers and one of the easiest to cultivate. It thrives in a greenhouse or conservatory during the summer, requiring a little extra heat during its flowering season. Although

work, and the *Ipomœas* soon furnished these supports. The plants branched very freely and entirely covered the surface of the wall, attaining a height of about 10 feet. It is sometimes advised to sow the seeds in February, but this is far too early for those planted out-of-doors; not much before the end of June is suitable. My practice is to sow the seeds in a warm house in May, to gradually harden off the plants when they are about 6 inches high, and to place them afterwards in a cool greenhouse. By the end of June they

FARM INSTITUTES.

A circular issued by the Board of Education to county education authorities announces that the Treasury, upon the recommendation of the Development Commissioners, have decided to make an advance from the Development Fund to the Board of Education in order to enable the Board to make additional grants in aid of the provision by county education authorities of agricultural education, in so far as that falls within the province assigned to the Board of Education by the Memorandum of Arrangements between the Board of Agriculture and Fisheries and the Board of Education, issued on September 22, 1909 (Cd. 4886 of 1909).

The grants will be distributed under detailed regulations, which the Board hope to issue at an early date. They will be given, in accordance with the proposals made by the Board after consultation with representative members of county education authorities and in the light of the report of the Rural Education Conference on County Staffs, and concurred in by the Development Commissioners and the Treasury, in aid of the provision by individual counties or by combinations of counties of county staffs of agricultural instructors working from farm institutes as their headquarters. The several types of work within and without a farm institute which a county staff might undertake in appropriate circumstances are described in detail in the enclosed Memorandum on the Principles and Methods of Rural Education. It is intended that a farm institute should serve as the headquarters for the miscellaneous and itinerant work of the agricultural staff, other than that done in regular local courses of instruction, and for educational demonstrations and similar purposes, and that it should also provide accommodation for central courses of instruction in agriculture and kindred subjects. These central courses might include, for example, (i.) a 16 to 20 weeks' winter agricultural course for the sons of small farmers, who have acquired

some practical experience on the land since leaving elementary schools; (ii.) shorter courses in dairy work, poultry-keeping and the like during spring and summer; and (iii.) vacation courses for teachers of rural subjects in local continuation courses. The buildings of an institute should include (a) an educational block with class-rooms, laboratories for students and staff, dairy, poultry stores, carpenters' and smiths' shops, &c., and, where necessary, bee-keeping and fruit-preserving stores; (b) residential accommodation for the principal; and (c) such other accommodation as may be desirable. Suitable equipment for the educational work will of course be necessary, and additional provision may in some cases be required for the institution of an information bureau and a library in connection with the work of the staff outside the farm institute.

Aid will be granted from the Development Fund towards both the provision and the maintenance of farm institutes. The grant in aid of the provision or enlargement of a farm institute will be limited to an amount not exceeding in any case 75 per cent. of the total approved cost of the provision or enlargement. The maintenance of a farm institute will be aided in two ways. The authority providing the farm institute will receive grants under the Board's ordinary regulations for technical schools, &c., in respect of the instruction given by the county agricultural staff in regular courses. To these will be added a contribution from the Development Fund in respect of the miscellaneous and itinerant work of the staff, which will be so limited that the total exchequer aid distributed by the Board shall not exceed 50 per cent. of the total approved cost of maintaining the institute and its staff. The small amount of aid at present given towards the miscellaneous and itinerant work of a county staff, under Article 34 of the Regulations for Technical Schools, &c., will be discontinued, and the Board's grants, otherwise than out of the Development Fund, will in future be limited to regular courses of instruction.

On educational grounds the Board of Education regard it as essential for the successful working of a farm institute that there should be available and in close proximity to it a farm and garden. These will not only be required in connection with the internal courses of the institute, but should also serve as an object-lesson to the farmers and gardeners of the country. In some cases a "small holding" for demonstration purposes may with advantage be added. The farm and garden should be conducted on business principles, so far as may be consistent with their primary use for educational purposes; but it is probable that such use will as a rule entail some annual deficiency upon a profit and loss account. Under the Memorandum of Arrangements between the two Boards, it will be for the Board of Agriculture and Fisheries to distribute any State aid which may become available for the purposes of a farm and farm buildings. That Board will, it is understood, in fact seek an advance from the Development Fund for the purpose of enabling them to aid local education authorities to equip and maintain farms in connection with farm institutes.

It will as a rule be desirable that the value of a staff of agricultural instructors should be fully recognised in a county before it is given permanent establishment in an institute, and the regulations will, therefore, make temporary provision for grants towards the maintenance of a staff of instructors, which has been appointed in advance of the provision of its permanent headquarters, as an initial step in the more complete organisation proposed for a county or a group of counties.

The sums which will be advanced to the Board of Education up to March 31, 1916, from the Development Fund for the purposes explained above will not exceed in all £325,000. It is understood that the Development Commission are not prepared to recommend the making of any other advances during this period for the purpose of aiding the provision of such branches of agricultural education as fall within the province of the Board of Education. In these circumstances, local education authorities will doubtless recognise that no useful purpose will now be served by their undertaking the preparation of applications to the Treasury for direct advances from the Development Fund, and will instead make application to the Board of Education for aid towards farm institutes under the forthcoming regulations.

In making grants under this scheme to local education authorities, the Board of Education have undertaken to secure that the grants shall not have the effect of reducing the amount of any expenditure at present incurred by a local education authority out of rates or other local resources upon work of the type to be aided, or the amount of any contribution made by the authority out of such funds to the higher types of educational work conducted by agricultural colleges. It is also essential that only such farm institutes shall be provided and maintained by aid from the Development Fund as are really necessary, and in this connection the Board will give close consideration to the possibility and desirability of combination between counties for

OSMANTHUS ARMATUS, DIELS.

A LIVING plant of this new and strikingly distinct evergreen (see fig. 54) was brought by me from China in 1902 to Messrs. Veitch's Coombe Wood Nursery, where a good stock of young plants has been raised from the original. This new *Osmanthus* is a rare plant in a wild state, occurring sparingly in woods throughout Western Hupeh. It affects cliffs and humus-clad boulders, often in dense shade, but occasionally fully exposed to sun. As in the case of other *Osmanthus*es, *Hollies*, and prickly-leaved evergreens generally, the leaves become smaller and less spiny on adult plants. In one of my speci-

[Photograph by E. J. Wallis.]

FIG. 54.—FOLIAGE OF OSMANTHUS ARMATUS.

the purpose. In view of the limitations placed upon the funds at the Board's disposal, it may be necessary to impose limitations upon the number and size of the institutes to be aided in any individual county.

The detailed regulations will be supplied to the authority as soon as they can be prepared. Many points of detail in regard both to the substance and form of applications will require settlement and will need careful consideration, and the authority should therefore defer for the present the completion of any scheme they may have it in contemplation to make, either alone or in conjunction with other counties, as it will be impossible for the Board to deal with any applications relating to farm institutes or county agricultural staffs until the regulations have been published.

mens collected in 1900 (No. 2,645) the leaves are 2 to 3 inches long, oval, and the margins vary from spiny-toothed to quite entire. *Osmanthus armatus* has not flowered yet under cultivation. It belongs to the autumn-flowering group with axillary inflorescences like *O. aquifolium* as distinct from the spring-flowering species with a terminal inflorescence like *O. Delavayi*, Franchet.

The description here appended is founded on my Herb. No. 2,645 and living material (No. 1,915), and the distinguishing characters are well shown in fig. 54. In some respects it amplifies Dr. Diels's original description founded on a specimen collected in South Szechuan by von Rosthorn (No. 2,040). In the Kew Herbarium there are

several sheets of this plant collected by Dr. Henry in various localities in Western Hupeh.

Osmanthus armatus, Diels, in Eng. Jahrb., xxix., p. 532, describes the species thus:—

"An evergreen shrub or small tree 8-15 feet high, with rigid branchlets, greyish white by autumn, clothed with minute down and furnished with pale lenticels. Leaves oblong-lanceolate when young, 3 to 6 inches or more long, $\frac{3}{4}$ to $1\frac{1}{2}$ inch wide, acuminate, rounded or sub-cordate at the base and abruptly narrowed to petiole, coarsely denticulate; the teeth triangular with very slender, spiny points; dark, dull green above, paler beneath, glabrous on both surfaces; petioles and midrib often dull-red coloured, venation prominently reticulate; lower surface covered with minute dark dots. Petiole $\frac{1}{8}$ to $\frac{1}{4}$ inch long, downy. Flowers, creamy-white, fragrant, $\frac{1}{4}$ inch in diameter, produced in axillary fascicles in the autumn; corolla lobes sub-rotund; calyx glabrous irregularly toothed and lobed; peduncles glabrous about $\frac{1}{4}$ inch long, slender. Fruit ovoid, $\frac{3}{4}$ inch long, violet-black." *E. H. Wilson.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

KENSINGTON GARDENS.—Numbers of gardeners will be paying their annual visit to the parks and gardens in London during August and September. I trust they may have time to inspect the long walk in Kensington Gardens, where the flower borders are, and promise to be for some time to come, a perfect paradise of floral beauty. The Dutch garden near to Kensington Palace, with its fine Lily tank, is also just now very beautiful. *Wm. Lee, Kensington.*

SECRET COMMISSIONS.—I am desired by the committee of the Secret Commissions and Bribery Prevention League, Incorporated, to warn your readers against the practice of certain foreign firms who are in the habit of offering British gardeners a secret commission. One catalogue, for which I have to thank a gardener, has the words written upon an inside page in pencil, "5 per cent. discount for head gardeners." Illustrations of such practices might easily be multiplied, but the object of this letter is to put those who employ gardeners on their guard, as some of the offending firms have neither agents nor travellers in this country, and the Prevention of Corruption Act, which prevents British firms from giving secret commissions, affords no remedy in such cases. *R. M. Leonard, Secretary of the Secret Commissions and Bribery Prevention League, Incorporated.*

ROSA HEMISPHERICA (p. 92).—If G. M. Taylor will consult Clusius or Parkinson he will find that Nicholson was quite correct in his account of the introduction of this Rose. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

MUSSAENDA ERYTHROPHYLLA (see p. 95, fig. 43).—This plant was first distributed by the late Mr. William Bull of Chelsea, as long ago as 1888, and was figured in his catalogue for that year. It did not become popular, and after a time almost dropped out of cultivation. Within the last few years it has been more frequently met with in flower, and may yet prove to be a desirable garden plant. The creamy-yellow, five-pointed, star-shaped flowers with their ruby centres are very pretty, but extremely fugacious. The brilliantly-coloured sepals by which they are subtended are of a lasting nature, so that the plant remains an object of beauty for a considerable time. When first introduced to cultivation it was grown in the warmest part of the stove, under which conditions it grew freely but flowered seldom. In Messrs. Veitch's nursery at Feltham the plants are grown in a comparatively cool structure, with the result that flowers are freely produced. Cuttings root readily, and the young plants grow freely, but if the atmosphere is too hot and dry the leaves are liable to be attacked by red spider. In some parts of India it is employed as a bedding plant, the enlarged sepals being freely produced and brilliantly-coloured in that hot country. *H. T.*

"COX'S ORANGE PIPPIN."—Mr. Bunyard's note on this Apple (see p. 81) is very interesting and instructive, particularly in relation to *Sphaeropsis malorum*, one of the two leaf-spots to which Cox's Orange Pippin is specially subject. Mr. Bunyard's experience agrees with some American investigators in regarding this spot as a cause of canker. With respect to the need of avoiding the planting of Cox's Orange Pippin in large blocks, the question is as to whether the variety is self-pollinating or not. If it is, there seems to be no objection to planting in large blocks. In one orchard, I have 12 rows of the variety in one block, and one outside row, which has no Apple trees on the outside of it, is bearing as freely as the row on the other side next to trees of Mr. Gladstone, which are 144 feet distant. *A.*

—Mr. Bunyard expresses the opinion "that, for richness of flavour and digestible texture, this Apple is superseded by Roundway Magnum Bonum." I am aware that Mr. Bunyard holds a very high opinion of Roundway Magnum Bonum, and if his opinion is formed partly from its cooking qualities I will admit that it is a good-flavoured Apple in that respect. But how many who have grown the latter variety would regard it as equal to Cox's Orange Pippin? The fruit is too large for dessert purposes, and the variety has very little colour to recommend it for the table. Roundway Magnum Bonum is a good grower, but I have never found it a free cropper, and free growth alone is not sufficient to induce people to plant it. If this variety is so meritorious, how is it that it is not more generally cultivated? One seldom finds it in private gardens, and I believe Messrs. Bunyard's is the only firm which catalogue it; at any rate, that was the case in the past. American Mother is an excellent dessert variety. Lady Sudeley is fair, when eaten quickly after gathering. James Grieve is a nice-flavoured early Apple, and one which should be grown more extensively. Mr. Bunyard justly remarks that stocks are a most important matter in the cultivation of Cox's Orange Pippin, and also suitable land. Any variety of Apple grown on the approved Paradise stock (which is the approved stock) should be grafted sufficiently near to the ground to allow of the union being covered. We might then probably hear less of canker. I have saved more than one cankered Apple tree by replanting and covering the union, and this has also added to the vigour of the tree. *T. H. Slade.*

A HEAVY RAINFALL.—At New Barnet on Wednesday, July 26, during a thunderstorm, 2 inches of rain was registered. As much as 1.52 inch fell in 50 minutes. *A. M., Greenhill Park.*

THE HOLLYHOCK DISEASE.—What are the conditions favourable to the increase of *Puccinia malvacearum*, the Hollyhock disease? For many years it has, in the average garden, been almost impossible to retain any foliage on the plants. The flowers have usually been good, bright of colour, and fine in form, but they have been borne on bare poles. Various remedies have been tried, but still the rust quickly destroyed nearly every leaf. In a few instances seeds sown in the ground where the plants were intended to flower produced plants which survived the disease better than other plants did, but in far too many cases this change of method was ineffectual. But this summer one sees, in many different gardens, fine, stately Hollyhocks wreathed with beautiful flowers, and retaining large, rich leaves, almost, if not quite, to the ground. This welcome improvement naturally brings forth the inevitable "why." Can it be that, as often happens, the disease has worn itself out and is departing, almost as suddenly as it came, or is it that the Hollyhock rust has not found the weather conditions congenial? Chili, the home of the disease, is a country with a large annual rainfall and warm, moist summers, so that it seems reasonable to assume that as the disease was very abundant during the cycle of wet summers which we have just passed through, and that it is absent now, the conditions essential for its spread have been wanting. It has been demonstrated that when the carpels are attacked, the seeds produce diseased seedlings, so that it is quite possible to be entirely rid of the disease after another tropical summer, even though wet seasons follow. *A. C. Bartlett.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 64-70.)

(Continued from page 87.)

2, ENGLAND, N.E.

YORKSHIRE.—The fruit crops in this district are below the average, with the exception of Apples and Strawberries, which are average, and Gooseberries and Currants, which are rather larger crops than usual. The profusion of blossom was remarkable but prolonged drought and cold nights affected the yield unfavourably. The bright sunshine and drying winds experienced since rain fell at the end of June have exhausted the soil of moisture, and all fruit trees are now feeling the effects of drought most seriously. Our soil is of a stiff nature, and rests on a subsoil of marl, clay and chalk. *F. Jordan, Warter Priory Gardens, York.*

—The prospects for a good fruit year were favourable at the time of blossoming, but the deficiency of the rainfall was responsible for many of the fruits dropping, particularly Plums, these trees being bare of fruits. Apples are above a usual crop and of good quality. Strawberries were plentiful and promised well till drought and brilliant sunshine caused the plants to become dried up. Our difficulties in a dry season may be imagined when I state that our garden is situated on the top of a hill, and our thin soil overlies sandy rag. Only those crops that have been watered copiously have done well this season. We have had 57 rainless days, between May 1 and July 10. *J. G. Wilson, Chevet Park Gardens, Wakefield.*

—Strawberries promised a heavy crop, but owing to drought the berries failed to swell. Gooseberries, Currants and Raspberries were all heavy crops. Pears are a very poor crop; the trees produced very little blossom. Apples set exceptionally well, and although many of the fruits fell owing to the drought, there are still too many on the trees to mature properly. The soil in these gardens is a heavy loam resting on clay with red sand below. A season such as this suits it well. *Jas. E. Hathaway, Baldersby Park Gardens, Thirsk.*

—Apples are a satisfactory crop, especially early varieties. Pears are very scarce, but the fruits are very clean. Gooseberries, Raspberries and Red Currants are all good crops. Black Currants are scarce, and the bushes are affected with blight. The Strawberry crop was adversely affected by the drought. *Geo. P. Bound, Grims-ton Park Gardens, Tadcaster.*

—All bush fruits, with the exception of Black Currants, are very good crops. Strawberries were satisfactory, but the season was soon over. The Apple crop is very promising; trees of Bramley's Seedling, Lane's Prince Albert, Bismarck and James Grieve are carrying heavy crops. Plums are looking well, but the Pear crop is a poor one. Apricots are almost a complete failure. Both Raspberries and Loganberries are carrying very heavy crops. Early Potatoes have given only half the usual crop, although late varieties are satisfactory. *A. E. Sutton, Castle Howard Gardens, Welburn.*

3, ENGLAND, E.

CAMBRIDGESHIRE.—The Apple crop is very satisfactory, and the trees and fruits are clean, especially where spraying was practised last winter. Ribston Pippin worked on the Paradise stock is always satisfactory in these gardens, and this year the trees are carrying a heavy crop, for although many fruits have fallen, there are plenty left. Pears are an irregular crop, and the same remark applies to Apricots. Plum trees on walls and in the open are carrying heavy crops. Peaches and Nectarines promised well in early spring, but on the morning of April 12 9° of frost were registered, and this spoiled the prospects. Black Currants are rather scarce: the bushes were attacked by aphids at the time the fruits were setting. Strawberries have been an abundant crop, and the fruits were of good quality. *W. J. Snell, Wimpole Hall Gardens, Royston.*

—All hardy fruit trees produced an abundance of blossom, but the long-continued drought

has been the cause of large numbers of Apple and Pear fruits dropping. We have given the trees copious supplies of water, and mulched them, to ensure the fruits swelling. Bush trees, four years old, of Cox's Orange Pippin, Ribston Pippin, Wealthy, Stirling Castle, Ecklinville Seedling, and Lord Suffield Apples are carrying good crops. Pear trees set only half a crop of fruits, owing to the cold north-east winds in April and May. Black aphid has been very troublesome on Cherry trees, necessitating much labour in syringing with the garden engine, and the applications of insecticides. The soil here is a strong loam, resting on the blue gault. *T. W. Birkinshaw, Hatley Park Gardens, Gamlingay.*

—The Apple crop is a very thin one, the local Emneth or Victoria being the best variety; Lord Grosvenor following closely. The Pear crop is a failure; of Plums there is only a half crop of Victoria and Belle de Louvain, and even less of The Czar. Cherries are fairly plentiful, but the fruits are small. Among small fruits, Gooseberries are about three-quarters of the usual crop. Red Currants are about half the average quantity; Black Currants are very scarce, but Raspberries are satisfactory. The Strawberry crop was a good one, the variety Leader being especially fine. *Stephen Castle, Walpole St. Andrews, Wisbech.*

ESSEX.—There will be an abundance of nearly all kinds of fruits in these gardens; Apples, Pears, and Plums being especially good. Of small fruits, the yield of Strawberries, Gooseberries, and Currants is the finest I have known here. Frosts occurred when the trees of Nectarines, Peaches, and Apricots were in bloom, and later a hailstorm of great severity damaged these crops, but notwithstanding this, the crops are fair. The prolonged drought during May and June is probably responsible for a medium crop only of Morello Cherries. *Arthur Bullock, Copped Hall Gardens, Epping.*

—The Apple crop promised early in the season to be an extra good one, but owing to the drought many of the fruits have fallen. Black Currants were almost a failure, owing to late frosts and hailstorms. Early Strawberries were very good, but late varieties did not finish their fruits well, owing to the drought. *William Johnson, Stansted Hall Gardens, Stansted.*

—Notwithstanding the effects of the dry weather that prevailed during the month of May and the early part of June, and occasional sharp frosts during the latter month, the crop of Apples must be pronounced as fairly satisfactory. Large trees of Hambledon's Deux Ans, Norfolk Beefing, Bramley's Seedling, and King of the Pippins are all carrying good crops of fine, clean fruit. Young trees of the following sterling varieties of Apples are also bearing fair crops:—Stirling Castle, Ecklinville, Grenadier, Lord Grosvenor, Lord Derby, Early Victoria, Early Julian, Lane's Prince Albert, Emperor Alexander, Potts's Seedling, Lady Sudeley, and Warner's King. Pears, Plums, and Cherries are almost nil. Gooseberries are a good crop. Strawberries have been a good average crop. Royal Sovereign continues to bear satisfactory crops of fine, large, firm, well-flavoured fruits. Our soil is a sandy loam resting on a sandy-clay subsoil, the ground sloping southward, and is protected fairly well from the north and east. Altogether, the situation may be considered a favourable one. *H. W. Ward, Lime House, Rayleigh.*

LINCOLNSHIRE.—The prospects of a good fruit year were most promising in the spring, but frost, blight, and a long spell of dry weather have thinned the crops of Peaches, Pears, Plums and Apricots very considerably. Black Currants, too, have suffered from blight most severely. Apples are a splendid crop, and, on the whole, of good quality, especially on trees that were sprayed during the winter and spring. I have never had Strawberries of better quality and flavour than those of this season. *H. Vinden, Harlaxton Manor Gardens, Grantham.*

—Up to the present time the fruit prospects in this locality are very satisfactory. At one period Cherry trees and Currant bushes were badly infested with green and black aphid, but after giving the foliage a thorough syringing with quassia extract the trees became clean and healthy, and the crops are very good. *F. Barton, Hainton Hall Gardens, Lincoln.*

NORFOLK.—Apples are falling very badly through the dry weather. Raspberries and Gooseberries are both splendid crops, but Black Currants were scarce. *J. Wynn, Sedgford Hall Gardens, near King's Lynn.*

—The fruit crops generally through Norfolk are very good. The very wet summer of 1910, in conjunction with the very light crop last season, caused the fruit trees and bushes to make strong growths, and fears were entertained generally that, owing to an absence of sunshine, the wood would not ripen. But towards the end of the autumn we experienced open, sunny weather, with the result that most of the wood ripened somewhat, with the exception of Pears. I never saw blossom more plentiful or finer than this spring, and the genial, sunny weather, with no frost, were ideal conditions for the fruits setting. The long period of drought, especially where the land is light, has caused Apples to drop, but there is an abundance of fruits left. The trees also are very clean. *Lewis Smith, Shotesham Park Gardens, Norwich.*

—Considering the dry weather, the fruit crops are very satisfactory. The rainfall in April amounted to only 1.03 inch, in May to 1.29 inch, in June to 2.71 inches, and from June to July 14, the date of writing, 0.04 inches. Aphid has been very troublesome on Plum trees and Black Currant bushes. A copious rainfall would prove most welcome. Our soil is a sandy loam. *Wm. Allan, Gunton Park Gardens, Norwich.*

—The whole of the fruit crops gave excellent promise early in the season, but drought and insect pests have since spoiled the prospects. Until about ten days ago the Apple crop was very good, now large numbers of the fruits are dropping. The Strawberry crop was a very heavy one, but the berries were soon over, especially those of the variety Fill Basket. Owing to the abundant sunshine the flavour of Strawberries was very good. *William Orr, Stow Hall Gardens, Downham.*

—The promise for fruit in the early spring was exceptionally good, but late frosts, followed by drought in April and May, thinned the fruits of Apples, Pears and Black Currants. The rains in June benefited the Raspberry and Strawberry crops, which were above the average. We cultivate about 50 acres of fruit here, including Apples, Black Currants, Raspberries, and Strawberries. The soil is a rich, sandy loam. *G. D. Davison, Westwick Gardens and Fruit Farm, Norwich.*

SUFFOLK.—Spring frosts did much damage to the Pear and Apricot crops in this neighbourhood, only those trees that were well protected escaping damage. Our soil is of a rather heavy nature, but good. *Herbert Coster, Ickworth Park Gardens, Bury St. Edmunds.*

—The fruit crops in this district are very good, with the exception of Pears, Plums, Peaches, Apricots and Cherries, which are average or, perhaps, slightly under. Bush fruits and Strawberries have been abundant and of good quality. The Strawberries Royal Sovereign and Givon's Late Prolific are the most satisfactory sorts in our heavy soil. Apples are a very heavy crop, the fruits requiring considerable thinning. Our soil is of a very heavy nature, and rests on a cold clay subsoil. *James Hilson, Flixton Hall Gardens, Bungay.*

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—The fruit crops in early spring were most promising. The trees blossomed abundantly, especially Apples and Pears, but, owing to cold winds and dry weather, many of the fruits dropped. Bush fruits are good, with the exception of Black Currants, which are very thin, and the bushes have been badly affected with aphid, the foliage and shoots requiring frequent washings. Strawberries are always a good crop on our heavy soil. Givon's Late Prolific furnished a late supply of brightly-coloured and highly-flavoured fruits. Plums are about an average crop, those of the Gage type being the most numerous. Brown Turkey Figs furnished a good late crop. The soil is too cold for Cherries, and needs to be especially prepared and drained for these fruits. *F. J. Foster, Cranfield Court Gardens, Woburn Sands.*

—The fruit crops generally are looking well in this district, with the exception of Black Currants, which are a complete failure. Apples are a better crop than they have been for three seasons, but many of the fruits are dropping, owing to the prolonged drought. *C. J. Ellett, Chicksands Priory Gardens, Shefford.*

—The hot, dry weather is causing Apples and Pears to drop very freely. Plums are very badly infested with aphid. Some trees are smothered with a blue-coloured fly. Our soil is a light loam on gravel. Potatoes look well, but I have detected disease here and there, and it would no doubt spread quickly if rain fell. *H. W. Nutt, Ampthill Road, Flitwick.*

—There is a good average crop of all fruits this season, with the exception of Black Currants, which are not satisfactory in any part of the county. All other fruits are looking well. Apricot trees did not blossom freely, which may be attributed to the wet and sunless summer of 1910. The soil in the gardens is a light loam on a sandy and clay subsoil. *George Mackinlay, Wrest Park Gardens, Ampthill.*

—There was a wonderful show of blossom and no spring frost, but the fruits set badly, owing to the dry weather during the blooming period. *Laxton Brothers, Bedford.*

BUCKINGHAMSHIRE.—Although the crops of Apples are much below the average, the quality of the fruits is fairly good. Pears are almost a complete failure. The quality of bush fruit is good, excepting Black Currants, this crop being a very light one, and the quality poor. Early, mid-season, and late varieties of Strawberries gave average crops of good quality berries. Many orchard trees are badly blighted, and, on the whole, the crops in orchards are small. Our soil is a heavy, retentive loam, resting on clay, and the natural drainage is bad. *W. Hedley Warren, Aston Clinton Gardens.*

—The fruit crops in this neighbourhood are quite up to the average quantity, with the exception of Black Currants, which are largely grown as a market crop in these parts. The cold winds and frosts in spring caused the young fruits to drop, and, in many cases, the leaves also. Strawberries were plentiful and good, and late varieties are giving satisfactory crops. Apples, both culinary and dessert varieties, are good where the trees received proper attention in spraying. Cox's Orange Pippin, Ribston Pippin, Chas. Ross, Wealthy, and Lady Sudeley, amongst the dessert varieties, and Bramley's Seedling, Grenadier, Loddington, Tyler's Kernel, Peasgood's Nonesuch, and Lane's Prince Albert are all carrying heavy crops of good, clean fruit. Plums of all kinds are a heavy crop, and require thinning. Walnuts, Cobnuts, and Filberts are all very good. *Chas. Page, Dropmore Gardens, Maidenhead.*

CHESHIRE.—We had a magnificent show of blossom on all fruit trees, which appeared, in most cases, to set their fruits satisfactorily; but the long period of drought during May and early June caused the trees to suffer, and, consequently, to cast much of their fruit. The rain of June 17, however, has saved, with few exceptions, good crops, which are clean and promising. Our soil is a light, sandy loam, resting on a gravelly subsoil. *Charles Flack, Cholmondeley Castle Gardens, Malpas.*

DERBYSHIRE.—The fruit crops in this district were badly affected by drought in the spring months. Apples are a heavy crop, but the fruits are reported to be falling very freely. Pears, Plums, and Damsons are scarce. Strawberries have been good in both crop and quality, although in districts where the soil is light they suffered from the drought. The rainfall at the end of June, beginning with the 17th, saved the Strawberry crop, and on the strong clay land it has been excellent. Loganberries are a very good crop. This I consider one of the very best of fruits for small gardens. From 10 plants, on the 10th of July, I made a gathering of 10 lbs., and there promises to be several 10 lbs. to follow. The fruits make excellent jelly; better than Black Currant jelly. Dr. Hogg and President Strawberries have been splendid in size and quality this dry season. *Bailey Wadds, 181, Uttoxeter New Road, Derby.*

HERTFORDSHIRE.—The Apple crop in this district at one time promised to be a very heavy one, but the hot dry weather caused many of the fruits to drop, some sorts much more than others. The following varieties are carrying good average crops: Bramley's Seedling, Bismarck, Blenheim Pippin, Grenadier, Peasgood's Nonesuch, and Mère de Ménage. Varieties of Pears carrying the best crops are Doyenné du Comice, Pitmaston Duchess, Durondeau, Beurré Diel, Beurré Easter, and Beurré Bosc. Plums are a poor crop, the fruits being scarce in cases where the frost on June 15th damaged them. Small fruits are an excellent crop. Gooseberries, Red Currants, Strawberries, and Raspberries have all carried good crops. *C. E. Martin, The Hoo Gardens, Welwyn.*

—Following the poor crop of last season, it is gratifying to state that, on the whole, the fruit crops here are good. In April and May we were seriously troubled with insect pests, but by careful spraying we have been able to secure the promise of clean fruits. A severe hailstorm on May 31 injured the foliage and badly damaged much of the fruit; we have been able, however, to thin generally to fruits that were little damaged. The crop of small fruits is exceptionally good in both quantity and quality. *H. Prime, Hatfield House Gardens.*

—The fruit crops in this locality are very disappointing, especially Apples and Pears, although the Apple trees flowered abundantly. No frost worth mentioning occurred while they were in bloom, but in nearly all cases the fruits failed to set. I never considered the flowers were as strong as they should be, and the flowering period was somewhat later than usual. Pear trees failed to bloom satisfactory, but Plum trees were laden with blossoms. Peaches and Nectarines bloomed freely, but the fruits failed to set for the first time with us for many years. All kinds of bush fruit are good, and the bushes remarkably clean. Strawberries have never been better, the variety British Queen being especially good. The soil here is a stiff clay, and the gardens are 305 feet above the sea level; the situation is surrounded by hills. *Edwin Beckett, Aldenham House Gardens, Elstree.*

—The fruit crops generally are fairly satisfactory, with the exception of Apricots, which are almost nil. All stove fruits suffered from the effects of cold and a dry atmosphere early in May. Our soil is clay, partly on gravel and partly on chalk. The gardens are situated about 400 feet above the sea-level. *Wm. Whitelaw, Batchwood, St. Albans.*

LEICESTERSHIRE.—The Apple crop stands out as being the most abundant of our hardy fruits. Pears and Plums on wall trees are very short crops, although pyramid and standards in orchard give promise of an average crop. Of other stone fruit Peaches, Nectarines and Cherries are the best. Of small fruits Gooseberries and Raspberries are more than average crops. Red and Black Currants are scarce, especially the latter; owing to the drought in April and May many of the berries fell off. The Strawberries were much affected by the very hot days of early June. Our best Strawberries were gathered from plants of last autumn's planting, which confirms my opinion that by annual planting, especially in the case of Royal Sovereign, the best results are obtained. *Daniel Roberts, Prestwold Gardens, Loughborough.*

—Apple trees flowered abundantly and the fruits set very thickly. The weather at that stage was very bright, with cold north winds, but no frost. Within ten days a large quantity of the young fruits had dropped off, showing plainly that frost is not always the cause of fruits dropping. We have, however, sufficient fruit left, and some trees have too many. Pears are a thin crop, many trees having failed to flower. Plums are plentiful; the fruits set well, notwithstanding the cold weather. Peaches and Apricots flowered freely, and were well protected, as usual, but the exceptional cold weather early in April was too severe for them. On April 5 the minimum temperature was 27° and the maximum 35°, with showers of snow all day. We have experienced no day in April here so cold as that since our meteorological records were commenced, in 1876. Cherries are a heavy crop, following a very light one last year. The Straw-

berry crop was one of the best I have ever seen, notwithstanding the dry season. British Queen is still one of the best varieties, and Waterloo and Laxton's Latest continues the supply three weeks longer. Raspberries are a heavy crop. Gooseberries suffered severely from the cold in April. Insects have not been so troublesome this season as in some past years. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

—The fruit trees have been healthy until recently, but Plums are now blighted in many cases. Apples are healthy, strong, and clean, many sorts having fine crops. The severe frost of June 15 did considerable damage, and a fortnight's very low temperature afterwards retarded the growth of crops of all kinds. *John Harrison, Overdale Gardens, Aylestone, Leicester.*

(To be continued.)

SCOTLAND.

BIRD MIGRATION.

SOME exceedingly interesting results have been obtained in connection with the enquiry into bird migration now being carried out under the auspices of the Natural History Department of Aberdeen University. Aluminium rings have been placed on the legs of large numbers of young birds found in the nest, and on old ones. The following results obtained at an early stage of the work will serve to indicate how interesting the investigation is likely to prove. A song-thrush (*Turdus musicus*), one of a brood marked as chicks in the nest at Skeene, some seven or eight miles inland from Aberdeen, in early June, 1910, was shot near Leiria, Portugal, in early November of the same year. The two localities are about 1,250 English miles apart in direct over-seas line. Six lapwings (*Vanellus vulgaris*) marked as chicks in the north-east of Scotland in the summer of 1910, were shot respectively in counties Tipperary, Roscommon, Cork, and Limerick, and two in Portugal during the winter of 1910-11. A widgeon duckling (*Mareca penelope*), one of five marked in June, 1909, on Loch Brora, Sutherlandshire, Scotland, was taken in a duck-decoy in the province of Groningen, north-eastern Holland, on September 3, 1909. A second member of the brood was shot on the Trent, near Retford, Lincolnshire, in January, 1911, having worn the ring for one and a half year. Seven herring gulls (*Larus argentatus*), marked as chicks on the cliffs about 20 miles north of Aberdeen in the summer of 1910 were shot at different localities on the east coast of Scotland and England in the following autumn and winter.

FRUIT REGISTER.

CHERRY FRUHESTE DER MARK.

THIS new Cherry has been grown on the Continent for some years. In the district of Werder, near Berlin, it is considered to be the earliest yet introduced.

It is grown in France under the name of "La Plus Précoce de Marche," or, in error, "La Plus Précoce de Marché"—a natural mistake, "Mark," a district in the province of Brandenburg, being misread for markt (market).

Coming originally from Guben, where it was raised by Herr Kuppen, it was put in commerce by the firm of Spath, of Berlin, in 1887. Since that time its culture has extended rapidly, and this year, thanks, no doubt, to an exceptional spring, a Belgian grower marketed ripe fruit on May 29.

The fruit is of the Guigne type, and bears a good reputation for quality, and its bright rose colour will recommend it for market sale. It has been introduced into England, and should be tried in a warm soil to test its claims as the earliest Cherry grown. *Edward A. Bunyard.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 1.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the Chair); Messrs. E. M. Holmes, W. Cuthbertson, J. W. Odell, W. Hales, J. T. Bennett-Poë, J. Fraser, and F. J. Chittenden (hon. sec.).

Uncommon Orchids.—Mr. J. O'BRIEN drew attention to two uncommon Orchids shown by Sir TREVOR LAWRENCE—*Catasetum apterum*, which he regarded as nearly related to *C. splendens*, several varieties of which had been described, and *Eria mysorensis*, bearing pretty, small flowers, with a curious and rather unpleasant scent.

Antirrhinum, &c., malformed.—Mr. FRASER showed a flower of *Antirrhinum majus*, with the petals separated nearly to their bases, and therefore almost free. The flowers below it in the inflorescence were of normal structure. Two plants showed the peculiarity, but seed did not appear to be formed freely. He also showed *Gloxinia* flowers having petaloid outgrowths from near the base of the corolla, on its outer side, similar to those previously exhibited by Mr. ODELL of *Gloxinia* and *Streptocarpus*, and which Mr. ODELL had found in the former plant to be produced regularly every year.

Aconitum rostratum.—Canon ELLACOMBE sent a fasciated branch of this rare, white-flowered *Aconitum*.

Cucumber with persistent flower.—Dr. G. WALLER, of Wimbledon, exhibited fruits of Cucumber, having the flower green, and persisting even when the fruit was fully grown. This is not a very uncommon occurrence in fruits of this family, but Dr. WALLER's plants sent showed it in a marked degree.

Sweet Pea with supernumerary carpels.—Mr. CUTHBERTSON mentioned the occurrence in the garden of E. H. CHRISTY, Esq., of Margarettown, of Sweet Peas, having three pods produced from every flower in the variety Mrs. Hugh Dickson. The flowers appeared to be otherwise normal, but every flower on the plant produced three carpels, which had been noticed by Mr. A. IRELAND when examining Mr. CHRISTY's collection.

MORDEN COTTAGE GARDEN AND INDUSTRIAL.

AUGUST 2.—The 19th annual exhibition of this society was held in the pleasure ground of Morden Hall, the residence of Mr. G. E. Hatfield, on this date. The 1st prize and the Coronation medal offered for the best and most varied collection of garden produce in the show, was won by Mr. C. F. Cuss. The 2nd prize was awarded to Mr. E. PIERCEY, and the 3rd to Mr. A. LONGHURST. Mr. HATFIELD (gr. Mr. Alderman) arranged an attractive group of *Caladiums*, *Celosias*, *Gloxinias* and other plants, a well-grown *Kentia* being used in the background. At the opposite end of the same tent J. WORMALD, Esq. (gr. Mr. C. Gibson), displayed a group containing well-grown plants of *Lilium lancifolium rubrum*, *Achimenes*, *Begonias*, and blue and white forms of *Campanula pyramidalis*. An edging of *Coleus* and variegated *Panicum* (*Oplismenus*) completed the arrangement. The 1st prize for a decorated table was won by Mrs. LONGHURST, who employed *Gypsophila paniculata* and *Souvenir de Chas. Turner* Ivy-leaved *Pelargoniums*. Mrs. W. SARGANT gained the 2nd award with an arrangement of *Coreopsis*, *Gaillardia*, *Gypsophyla* and Grasses. Mrs. POUPART was very highly commended for an attractive exhibit of honey in sections and glass jars. The same exhibitor also gained the 1st prize for a lady's spray of pink Carnations backed with *Asparagus plumosus*. The 1st, 2nd, 3rd, and 4th prizes awarded for allotments were won by Messrs. H. COLLYER, A. LONGHURST, E. PIERCEY, and G. ROWE in the order named.

Messrs. D. S. THOMSON & SONS, Wimbledon, staged a non-competitive group comprised of several of the newer forms of *Nephrolepis*, *Todea africana*, also *Phoenix Roobelinii* and other decorative Palms. The best collection of plants grown in a window box was exhibited by Mr. H. COLLYER.

SCOTTISH HORTICULTURAL.

AUGUST 1.—The monthly meeting of the above Association was held in the Goid Hall, 5, St. Andrew's Square, Edinburgh, on this date. Mr. Massie, the president, occupied the chair, and there were 70 members present.

The paper on this occasion was on "The Cultivation of the Perpetual-flowering Carnation," by Mr. Thomas Hay, superintendent of Greenwich Park (late of Hopetoun), and in the absence of the author it was read by the secretary.

The exhibits were:—Dwarf Polyantha Rose "Jessie" and French and African Marigolds, from Messrs. DOBBIE & Co., Edinburgh; pyramid-trained Gooseberries, from Messrs. STORRIE & STORRIE, Carse of Gowrie Nurseries, Perthshire; Tomato Gilbert's Improved Sunrise and a seedling variety, Strawberries Givon's Late Prolific and The MacMahon, and Black Currant "Scarlett's Edina," from the City of Edinburgh Distress Committee's farm at Murieston, per Mr. CAIRNS, manager; Eucomis punctata, from Mr. A. JOHNSTONE, Hay Lodge, Edinburgh.

At the meeting on September 5 a paper will be read by Mr. Alex. Porter, Davidson's Mains, Midlothian, on "Montbretias."

Four new members were elected.

It was intimated that an address of welcome from the office-bearers and members of the Association had been forwarded to the Secretary for Scotland for presentation to the King on the occasion of Their Majesties' recent state visit to the city, and that a basket of Scotch-grown Roses had been presented to Her Majesty the Queen by the president and council.

MIDLAND CARNATION AND PICOTEE.

AUGUST 2, 3.—The 21st annual exhibition held at the Botanical Gardens, Edgbaston, on the above dates, was very much smaller than usual. The quality of the flowers, too, was below the average seen at Birmingham. Twenty-seven classes were provided for Carnations and Picotees, i.e., 13 for dressed flowers shown on boards and 14 for undressed flowers displayed in vases with their own foliage and buds. Prizes for Sweet Peas were also included.

DRESSED FLOWERS ON STANDS (OPEN).

In a class for 12 Self Carnations there were five exhibits. The 1st prize was won by Messrs. A. R. BROWN, LTD., Wychall Lane, King's Norton, with beautifully fresh flowers of the varieties Ann Hathaway, Mrs. G. Marshall, Elizabeth Shiffler, Mrs. R. B. Waite, Everest, Alfonso, W. H. Parton, Iberia, Cambria, Mrs. F. J. Johnston, Sydney and Royal Velvet. 2nd, Mr. C. J. WHITE, Walsall, who showed well-developed flowers of Blaizer, Mrs. Guy Seabright, John Knox, Miss Alley, Medox and Alice Woodward. 3rd, Mr. C. H. HERBERT, Acocks Green.

The best of six exhibits in a class for 12 Fancy Carnations were shown by Mr. A. W. JONES, Stechford, who had large, handsome flowers of Mrs. Leo Hunter, Linkman, Father o'Flynn, Liberté, Erl King, Lord Steyne, Gloriosa, Hengist, Pathfinder, Billy Barlow, Linkman (sport) and Queen Eleanor. 2nd, Messrs. A. R. BROWN, LTD. 3rd, Mr. HAYWARD MATHIAS, Medstead.

In the class for 12 Yellow-ground Picotees, the last-named exhibitor won the 1st prize with refined flowers of Libra, Onward, Iago, Mrs. W. Heriot, Ariel, Styx, Exquisite, Ida Pope, Corona, Lady Douglas Galton, Her Majesty and Alpha. 2nd, Messrs. A. R. BROWN, LTD. 3rd, Mr. C. H. HERBERT.

Messrs. A. R. BROWN, LTD., excelled in a class for 12 White-ground Picotees showing excellent flowers of Hon. Mrs. Kenyon, Fortrose, Muriel Stevens, Muriel Horton, Lavinia, Duchess of York, W. E. Dickson, Lady Ethel, Mrs. Sharp, Mrs. Gorton, Amy Robsart and John Smith. 2nd, Mr. C. H. HERBERT, whose flowers of Fortrose, Hon. Mrs. Kenyon, Amy Robsart and Favourite were meritorious. 3rd, Mr. C. J. WHITE. Messrs. A. R. BROWN, LTD., also won the 1st prize for 12 Flake or Bizarre Carnations, with good flowers of C. H. Herbert, Gordon Lewis, Guardsman, Ophelia, George Rudd, Joseph Jester, Shamrock, George Melville, Pandora, Merry Thought, Barnaby Rudge and Edward Adams. 2nd, Mr. C. F. THURSTON, Wolverhampton. 3rd, Mr. HAYWARD MATHIAS.

DRESSED FLOWERS ON STANDS (AMATEURS).

For six Self Carnations Mr. F. W. GOODFELLOW, Walsall, was placed 1st with an even set of flowers of the varieties Blaizer, Elizabeth Shiffler, Anglia, Miss Willmott, W. H. Parton and Hadzor. 2nd, Rev. C. A. GOTTWALTZ, Droitwich.

Mr. F. W. GOODFELLOW also showed the best exhibit of six Fancy Carnations. The varieties Pathfinder, Mrs. Leo Hunter and Hidalgo were noteworthy. 2nd, Rev. C. A. GOTTWALTZ.

Mr. GOODFELLOW also won the 1st prizes in classes for (1) six Yellow-ground Picotees, and (2) six White-ground Picotees.

Mr. C. F. BUDENBERG, Marple, Cheshire, was the only exhibitor in a class for six Flake or Bizarre Carnations, and he well deserved the 1st prize awarded, as his flowers were large, shapely and very fresh.

In the three following classes reserved for amateurs who do not grow more than 300 plants, competition was very keen, no fewer than 25 exhibits being placed before the judges. Mr. J. B. WILLETT, Yardley, won the 1st prize for six White-ground Carnations or Picotees, with superb flowers of Lady Sybil, Maud Brown, Mrs. C. H. Herbert, W. E. Dickson, Elaine and Favourite. 2nd, Mr. JOHN T. SIMISTER, Denstone.

Mr. J. H. CAMM, Smethwick, was placed 1st in classes for (1) six Self Carnations and (2) six Yellow-ground Carnations or Picotees.

UNDRESSED FLOWERS SHOWN IN TREBLES (OPEN).

Although the undressed flowers were not very numerous, they were much appreciated by visitors. Messrs. A. R. BROWN, LTD., won the 1st prize in each of the four open classes. In the first class for six Self Carnations they had very fine flowers of Mrs. G. Marshall, Miss Alley, Crystal, Signal Light, Cambria and Ayesha. 2nd, Mr. C. H. HERBERT.

In Messrs. BROWN's 1st prize stand in the next class for six varieties of Fancy Carnations, we noted grand blooms of Liberté, Becky Sharp and Clement. 2nd, Mr. C. J. WHITE. In a class for six varieties of Yellow-ground Picotees, Messrs. A. R. BROWN, LTD., beat Mr. C. H. HERBERT and Mr. HAYWARD, who were placed 2nd and 3rd respectively.

Messrs. BROWN were the only exhibitors in a class for White-ground Picotees. Their best varieties were Lady Sybil, Fortrose, and W. E. Dickson.

BLOOMS SHOWN IN TREBLES (AMATEURS).

The most successful exhibitor in this section was Mr. C. F. BUDENBERG, Marple, Cheshire, who won 1st prizes in classes for (1) three varieties of Self Carnations, (2) three varieties of Fancy Carnations, (3) three varieties of Yellow-ground Picotees, and (4) three varieties of White-ground Picotees.

1st prize winners in the small amateur classes were Mr. W. ROGERSON, Mellor, Derbyshire, and Mr. W. C. FLANDERS, Derby.

PREMIER FLOWERS (DRESSED).

Bizarre Robert Houlgrave, shown by Mr. C. F. THURSTON; Flake George Melville, shown by Mr. C. F. THURSTON; Heavy-edged White-ground Picotee Clementine, shown by Mr. F. W. GOODFELLOW; Light or Wire-edged White-ground Picotee Fair Maiden, shown by Mr. F. W. GOODFELLOW; Heavy-edged Yellow-ground Picotee Corona, shown by Mr. HAYWARD MATHIAS; Light-edged Yellow-ground Picotee Exquisite, shown by Mr. HAYWARD MATHIAS; Yellow-ground Fancy Mrs. Leo Hunter, shown by Mr. A. W. JONES; Self Daffodil, shown by Mr. J. H. CAMM.

PREMIER FLOWERS (UNDRESSED).

Self Daffodil, shown by Mr. C. F. BUDENBERG; Fancy Hidalgo, shown by Mr. C. J. WHITE; Yellow-ground Picotee Exquisite, shown by Mr. HAYWARD MATHIAS; White-ground Picotee Lady Sybil, shown by Messrs. A. R. BROWN, LTD.

The Silver Medal offered to the exhibitor gaining the highest number of points in the open classes was won by Messrs. A. R. BROWN, LTD., with 204 points. Mr. C. H. HERBERT gained the Bronze Medal with 84 points. Mr. C. F. BUDENBERG secured the Silver Medal offered in the amateur classes with 116 points. The Bronze Medal was won by Mr. F. W. GOODFELLOW with 96 points. These medals were all given by the

Birmingham Botanical and Horticultural Society. The Midland Carnation Society's Silver Medal offered in the smaller classes was won by Mr. J. B. WILLETT with 68 points, and the Bronze Medal by Mr. W. ROGERSON with 60 points.

SWEET PEAS.

Prizes were provided for Sweet Peas by ROBERT SYDENHAM, LIMITED. For 12 varieties of 20 to 30 stems. Mr. A. TAYLOR, Olton, won the 1st prize. 2nd, Mr. E. DEAKIN, Hay Mills. For six varieties, Mr. S. SMITH, Bournville, was placed 1st, and Miss JESSIE HIRST, Yardley, 2nd.

HONORARY EXHIBITS.

Messrs. GUNN & SONS, Olton, staged a large exhibit of Roses. (Silver-gilt Medal.)

Messrs. W. H. SIMPSON & SONS, Birmingham, showed a collection of Sweet Peas. (Silver Medal.)

Mr. ROBERT SYDENHAM, LIMITED, Edgbaston, showed Sweet Peas in pots.

Mrs. WALTER BARROW, Edgbaston, exhibited Gloxinias and Ferns.

WESTON-SUPER-MARE HORTICULTURAL.

AUGUST 3.—This society held its annual exhibition in the charming Grove Park and Glebe House grounds on this date. The groups and exhibits in the decorative classes were exceptionally good. Messrs. J. CYPHER & SONS, Cheltenham, were placed 1st for a group of plants arranged in a space of 100 square feet. The exhibit was far better than that shown at Cardiff by this firm, the Orchids being much fresher. 2nd, Mr. CORNELIUS, a local exhibitor. In the class for six stove and greenhouse-flowering plants, three flowering and three foliage kinds, Messrs. J. CYPHER were again placed 1st and Mr. CORNELIUS 2nd, with B. C. SHEPHERD, Bridgewater, 3rd. A challenge cup was offered in the class for a group of plants in a space of 75 square feet, arranged for effect. Mr. C. J. ELLIS, Weston Nursery, Weston-super-Mare, set up a most effective group and won the cup for the second year in succession. A magnificent plant of *Areca lutescens* crowned the centre, and from this hung *Hiawatha* Roses and *Lilium lancifolium* album, whilst arranged in rustic mounds were some very finely-coloured *Codiaeums* and *Amaranthuses*. Choice flowering and stove foliage plants formed the groundwork, and the front was pleasingly broken and finished with well-berried plants of *Nertera depressa* and other suitable subjects. Messrs. W. BROOKS showed the best shower bouquet, and Mr. C. J. ELLIS the best shower bouquet of Carnations and best epergne of flowers.

The challenge cup offered for the exhibitor gaining the highest number of points in the show, a 1st to count three points, 2nd two points, and 3rd one point, was won by Mr. B. C. SHEPHERD, Bridgewater.

ROYAL LANCASHIRE AGRICULTURAL.

AUGUST 3-7.—The horticultural section of the Royal Lancashire Agricultural Society showed a considerable falling off this year, although the quality of the exhibits was good. Cut flowers and vegetables were very poorly represented. In the class for a group of miscellaneous plants, Messrs. JAMES CYPHER & SONS, Cheltenham, won the 1st prize for a well-finished exhibit, in which *Codiaeums* (Crotons) played an important part. Palms, Alocasias, Ixoras, Cattleyas, and *Liliums* were all utilised to advantage. Mr. W. A. HOLMES, Chesterfield, was placed 2nd.

Messrs. CYPHER also won the 1st prize offered for 12 stove or greenhouse plants, staging *Kentia Fosteriana* and *australis*, *Latania borbonica*, *Crotons*, *Warrenii* and *Flambeau*, *Clerodendron Balfouri*, *Allamanda nobilis*, *Erica obnata* magnifica, *Statice intermedia* and other kinds. This firm also excelled in the class for 12 plants in pots not exceeding 10 inches in diameter. *Ixoras* *Pilgrimii* and *Regina* were exhibited splendidly.

The best six exotic Ferns were shown by J. W. MCCARTNEY, Esq. (gr. Mr. W. Holmes), *Nephrolepis Todeaoides* and *Adiantum cuneatum* elegans being specially good.

Messrs. CYPHER led for six Orchids and Mr. W. HOLMES had the best specimen plant of an Orchid.

In the class for a table of cut flowers measuring 100 square feet, Mr. H. DICKSON won the

1st prize, which included a Silver Cup, for a charming collection of Roses. Mr. J. SAUL, Preston, also won a 1st prize for cut flowers, with good Lilliums, Gladiolus, Hydrangeas, &c.

The best exhibits of 18 and 12 varieties of Sweet Peas in vases, were shown by Mr. F. HINDLEY, Lymm.

In the amateurs' section, Mr. EDGAR M. ALLEN showed the best six vases of Sweet Peas, and he was awarded the Silver Cup offered for the best collection of Sweet Peas exhibited by a grower in the county of Lancashire. Messrs. C. E. TAYLOR, Carnforth, Mr. F. H. SMITH, Preston, Mr. G. LAYWELL, Wigan, Mr. J. N. FELL, Preston, and Mr. J. HOWARTH, Bury, all won 1st prizes in this section.

Mr. C. F. WATERS, Balcombe, showed the best Carnations, and Messrs. H. CLARK & SON, Leeds, the best show and Cactus Dahlias.

Messrs. J. GIBSON & Co., Bedale, had the premier exhibit of hardy perennials in the open class, and Mr. F. J. SMITH excelled in the amateurs' section for hardy perennials.

Mr. HUGH DICKSON, Belfast, won the 1st prize in the class for 24 Roses, having bright, fresh blooms, and Messrs. ALEX DICKSON & SON, Newtownards, showed the best exhibit of 12 Roses.

J. B. WALMSLEY, Esq., Burnley (gr. Mr. J. Scholes), won the Silver Cup offered in the amateurs' classes for the best stand of these Roses from a garden in the county of Lancaster.

FRUIT AND VEGETABLES.

The Duke of PORTLAND, K.G. (gr. Mr. J. Gibson), showed the premier exhibit of 12 dishes, distinct. He had good bunches of Muscat of Alexandria and Madresfield Court Grapes, Crimson Galande and Bellegarde Peaches, Pineapple and Humbolt Nectarines, Royal Sovereign Melon, &c. 2nd, the Earl of HARRINGTON (gr. Mr. G. H. Goodacre).

The Duke of PORTLAND showed the best two bunches of black Grapes in the variety Madresfield Court. The Earl of HARRINGTON excelled in the classes for Black Hamburgh, Foster's Seedling, and Muscat of Alexandria Grapes; this exhibitor had the best scarlet-fleshed Melon. The Duke of PORTLAND won the 1st prizes in the classes for a green-fleshed Melon, Six Peaches, six Nectarines, and six dessert Apples.

The Duke of PORTLAND secured the premier awards in the classes for nine distinct kinds and for six distinct kinds of vegetables, his Scarlet Runners, Peas, and Onions being excellent produce.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. DICKSON, BROWN, and TAIT, Manchester, for a collection, of about 100 varieties of Tomatos. This exhibit was an outstanding feature of the exhibition. This firm also showed Roses, Lilliums, Gladiolus, and vegetables. Messrs. A. DICKSON & SONS, Newtownards, for a collection of Roses. Messrs. H. B. MAY & SONS, Edmonton, for a large collection of choice Ferns. Mr. R. BOLTON, Carnforth, for an imposing exhibit of Sweet Peas.

Silver Medals were awarded to Mr. H. MIDDLEHURST for Sweet Peas, and to Messrs. BOLTON BROS. for Ferns.

Messrs. CLIBRAN showed Tomatos, Peas, Beet, and other garden produce. Messrs. DICKSON & ROBINSON exhibited Scabious, Spiræas, Gladiolus, and other flowers.

PERTHSHIRE SWEET PEA.

AUGUST 4, 5.—The second annual exhibition of the Perthshire Sweet Pea Society was held in the City Hall on these dates. There was a large attendance of visitors in the afternoon, when Lady Dewar, who was accompanied by Sir John A. Dewar, Bart., M.P., performed the opening ceremony.

Considering the dry weather, the show, as a whole, was a remarkably fine one. We noted that one or two of last year's foremost exhibitors were absent, owing to the want of rain (rather unusual for Scotland). Mr. Fender, winner of the Champion Cup last year, was unable to stage a single vase, and yet the flowers shown in the cup class were of superb quality. The premier collection, shown by Mr. JOHN A. GRIGOR, Forres, was exceptionally good. The flowers were large

and clean, the colours well defined, and the stems 15 to 18 inches long, yet the blooms had no suggestion of coarseness.

Mr. GRIGOR secured the highest awards in four other classes with flowers of equal merit. The varieties for which the cup was awarded were:—Dobbie's Sunproof Crimson, Mrs. Hugh Dickson, Elsie Herbert, Nubian, Masterpiece, Mrs. W. J. Unwin, Etta Dyke, Edrom Beauty, Countess Spencer, Isobel Malcolm, John Ingman, and Earl Spencer. Mr. YOUNG's collection, of Falkland Palace, was only a point or so inferior to the 1st prize exhibit. In the small-growers' section, Mr. G. MILNE, of Montrose, was the most successful exhibitor, winning nearly all the 1st prizes. In the pink section, his vase of Hercules (probably the best vase in the show) was the admiration of everyone. Other outstanding prize-winners were Mr. JAMES DUTHIE, Dundee; Rev. H. MAYALL, Comrie; Mr. KIRKWOOD, Crieff; Mr. G. REID, Dundee; Mr. DEMPSTER, Dunkeld; and Mr. ADAMS, Brechin.

Miss A. B. MECHIE, of Perth, secured the 1st prize for a table decoration, with a peculiar combination of mauve Sweet Peas, to which a touch of pink was added.

For a display of Sweet Peas, open to the trade, Messrs. THYNE & SON, Dundee, were awarded the 1st prize, Messrs. YOUNG & Co., Elgin, being 2nd.

NON-COMPETITIVE EXHIBITS.

Messrs. DOBBIE & Co. put up a beautifully arranged bank of Sweet Peas, which included charming vases of Melba, Red Star, Mrs. Cuthbertson, Lady Knox, Dobbie's Cream, Elfrida Pearson, Dobbie's Thomas Stevenson, and May Campbell. (Gold Medal.)

Messrs. COCKER & SON, Aberdeen, supplied a pleasing change from Sweet Peas in a beautiful exhibit of Roses and hardy flowers. (Gold Medal.)

Messrs. HENDERSON & SON, Perth, exhibited Carnations and other flowers. (Silver Medal.)

Great interest was taken in the duplicate vase of Sweet Peas that won the *Daily Mail* prize of £1,000, also vases shown by Mr. FRASER and several silver medalists in that competition.

In the afternoon, a conference, which was largely attended, was held in the Lesser Hall, when a lecture on "Staging and Judging" was given by Mr. W. P. Wright, and Mr. Wm. Cuthbertson, of Messrs. Dobbie & Co., read an interesting paper on "New Sweet Peas."

PRESCOT HORTICULTURAL.

AUGUST 7.—The annual exhibition of this society was again held in Knowsley Park, the seat of the Earl of Derby. The entries were much fewer in numbers than usual. Mr. W. ROWLANDS' collection of Roses was an especial feature of the show.

In the class for a group of plants arranged for effect, F. DIXON-NUTTALL, Esq. (gr. Mr. W. H. Roberts), was awarded the 1st prize, his Caladiums, Palms, Codiums, and Carnations being very good. 2nd, F. R. DIXON-NUTTALL, Esq. (gr. Mr. J. Barker).

The best two Palms were shown by T. HENSHAW, Esq. (gr. Mr. J. George).

For four stove or greenhouse plants J. STONE, Esq. (gr. Mr. D. McKelvie), excelled, his plants including a well-flowered specimen of *Clerodendron Balfouri*; 2nd, Mr. DIXON-NUTTALL.

Mr. D. MCKELVIE won the 1st prizes in the classes for four stove or greenhouse plants, four greenhouse plants in bloom, and one specimen plant in bloom, and a specimen foliage plant.

E. SHORROCK ECCLES, Esq. (gr. Mr. C. Houghton), won the 1st prize in the class for four Caladiums, followed closely by Mr. J. BARKER.

The best exhibit of four Begonias was made by F. C. HALL, Esq. (gr. Mr. E. Lambert), whilst Mr. J. BARKER had the best four Zonal-leaved Pelargoniums and single specimen of the same.

Mr. DIXON-NUTTALL excelled in the classes for three Fuchsias and for three Coleuses.

The leading awards for Roses were shared by Messrs. J. BARKER, C. HOUGHTON, and J. EVANS.

Mr. J. GEORGE had the best herbaceous cut flowers, including Sweet Peas and Dahlias, and Mr. E. LAMBERT the best dozen Begonias.

Fruit was not shown largely. In the class for four dishes the prizewinners were Messrs. D. MCKENZIE, J. BEECHAM, Esq. (gr. Mr. W. Oldham), and Sir D. GAMBLE (gr. Mr. W. S. Barnes) in this order.

Mr. OLDHAM won the 1st prizes in both classes for Grapes with Madresfield Court and Buckland Sweetwater.

Mr. J. GEORGE had the best collection of nine varieties of vegetables; Messrs. W. J. ROBERTS and J. BARKER being 2nd and 3rd respectively.

WEST DERBY HORTICULTURAL.

AUGUST 9.—The annual exhibition of the above society, held on this date in glorious weather again provided a success. The use of the old show ground was again granted by the Rev. P. Stewart, and the tent was well filled with well-arranged exhibits. The schedule was a comprehensive one, embracing more than 100 classes.

Three exhibits were staged in the class for a group of plants in a space of 10 square feet. The 1st prize was won by Drs. TIDSWALL and INGALL (gr. Mr. G. Osborne); 2nd, A. H. JONES, Esq. (gr. Mr. H. Spencer); 3rd, Mr. H. OGDEN. Drs. TIDSWALL and INGALL also excelled in the classes for two and one Palms respectively, for four stove or greenhouse plants, for six table plants, 12 blooms of Roses, and 12 bunches of hardy annuals.

A silver Rose bowl was offered for the best collection of 12 varieties of Sweet Peas; it was won for the third time by Mr. J. B. NICHOLLS, and thus becomes his absolute property. The blooms were fresh and of moderate size.

R. R. HEAP, Esq. (gr. Mr. H. Osborne), showed the best six dishes of fruits, distinct, whilst for six dishes Messrs. TIDSWALL and INGALL were awarded the 1st prize, and these exhibitors beat all other competitors in the class for nine varieties of vegetables, distinct. In the class for six varieties of vegetables, H. MCCUBBON, Esq. (gr. Mr. R. Cleaton), and D. CUNNINGHAM, Esq. (gr. Mr. S. Leith), were placed 1st and 2nd respectively.

DUTCH BULB GROWERS'.

THE following Awards have been made at the recent meetings of the Floral Committee, at Haarlem:—

AWARDS OF MERIT.

Leucanthum maximum excelsum.—The flowers are pure white, and of large size.

Gladiolus "Electra".—This variety has flowers of a brilliant vermilion colour.

Gladiolus "Hohenzollern".—The flowers of this new variety are rosy-salmon, spotted with reddish-brown.

Gladiolus nanceianus "Willy Wigman".—A rosy-white variety, spotted with purple.

Gladiolus "Meteor".—The flowers are scarlet shaded with brownish-red.

Gladiolus nanceianus "Golden West".—A Californian variety; the brilliant orange flowers are spotted with carmine.

Gladiolus gandavensis "Ivorine".—A creamy-yellow variety.

Phlox decussata "Asia".—The flower-trusses are very large; the orange-coloured blossoms are shaded with carmine.

REMARKS.—English Apples are arriving in considerably increased quantities. Beauty of Bath and Quarrenden are selling freely, also large Culinary varieties. Black and Red Currants, Gooseberries and Cherries are finished. Tomatoes have been a shorter supply during the past week. The last shipment of Tasmanian Apples is not yet unloaded at the docks owing to the strike—this is also the case with the first shipment of Californian Pears and Plums. The Grape trade this week has been brisk, at moderate prices. Supplies of Peaches and Nectarines have increased. Melons are plentiful and meeting with a good demand at much lower rates. Outdoor Figs are now obtainable in quantity at reasonable prices. E. H. R., Covent Garden, August 9, 1911.

REMARKS.—Trade has improved and prices have advanced a little on account of a shorter supply. Edward J. Newborn, Covent Garden and St. Pancras, August 9, 1911.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 5, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Over the country generally the weather last week was less settled than at any time since the close of June, but in the east and south-east of England the rainfall was again slight. Thunderstorms were experienced at various times in most districts, and were accompanied in a few cases by exceedingly heavy showers.

The temperature was again above the normal, the excess amounting to more than 6° in England N.E. and the midland counties, and to 7° in England E. The highest of the maxima were observed in the earlier half of the week, and ranged from 88° in England E. and 85° in England S.E. to 75° in Scotland W., and to 74° in Ireland. The lowest readings were observed at times varying greatly in different localities. In the English Channel the thermometer failed to fall below 57°, and in England N.E. and N.W. it did not fall below 52°, but in Ireland N. it sank to 45°, and in Scotland E. to 42°. The lowest grass readings reported were 37° at Llangamarch Wells, 38° at Crathes and 39° at Markree Castle.

The mean temperature of the sea was higher than in the corresponding week of last year, excepting round Shetland, where it was a trifle lower. On the English coasts the difference was rather considerable; at Margate it amounted to more than 8°. The mean values for the week ranged from 70° at Margate and 65° and upwards on the east and south-east coasts of England generally to about 54½° at Wick and to a trifle below 54° at Lerwick.

The rainfall was largely in excess of the average in most of the western districts, but a little below it in Scotland W. Over the northern, eastern and central parts of Great Britain there was a general deficiency, and at many places in England E. and S.E. the amount was quite unappreciable. In the west the heaviest falls occurred on Friday and Saturday; on the former day 1.3 inch was collected at Holyhead, 1.4 inch at Falmouth and 1.5 inch at Bettws-y-Coed; while on the latter day 1.1 inch was registered at Southport, 1.2 inch at Cullompton and 1.4 inch at Liverpool.

The bright sunshine was in excess of the average in all districts excepting the English Channel. The percentage of the possible duration ranged from 59 in England E. and 57 in England S.E. to 36 in Ireland S., 34 in Scotland N., and 32 in Ireland N.

THE WEATHER IN WEST HERTS.

Week ending August 9.

The hottest day as yet recorded here.—The first few days of the past week proved only moderately warm, but on each of the last three days the temperature in the thermometer screen has exceeded 80°, and on the last of those days rose as high as 96°. The latter is not only the highest reading as yet recorded here this year, but also higher than in any month during the 25 years over which my records at Berkhamsted extend. The nights proved warm, but, as in the two previous weeks, not remarkably so. At 2 feet deep the ground is now 4° warmer, and at 1 foot deep as much as 7° warmer than is seasonable. Some rain fell on two days of the week, but the amounts deposited proved insignificant. For more than five weeks no rainwater at all has now passed through either of the percolation gauges. The sun shone on an average for 7½ hours a day, which is 1½ hours a day in excess of the usual duration at this period of the year. As in the previous week the winds proved light, the direction being principally some point of the compass between S. and W. The mean amount of moisture in the air at three o'clock in the afternoon fell short of a seasonable quantity for that hour by as much as 15 per cent. On one day the difference between the readings of an ordinary thermometer and one with its bulb kept constantly moist amounted at 3 p.m. to as much as 25°. On that occasion the air was, with two exceptions, drier than in any month during the past 25 years. E. M., Berkhamsted, Aug. 9, 1911.

DEBATING SOCIETY.

READING GARDENERS.—The members of this association visited Wilton House, Salisbury, on July 26, on the occasion of their annual outing. The party, which numbered 100, was conducted through the mansion and gardens by Mr. Challis. At 4.45 p.m. farewell was taken of Wilton with many expressions of thanks to Mr. Challis. Those who had railway connections to make at Reading made the return journey early; the majority, however, broke the journey at Salisbury for the purpose of visiting the Cathedral. Reading was reached at 9.40, the excursion being pronounced one of the most successful and enjoyable ever promoted by the association.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting Box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

Mr. J. H. KEAT, for the past 2 years and 4 months Foreman at Broadoaks, Byfleet, Surrey, and previously Foreman at Effingham Hill and Porter's Park, as Gardener to Wm. CLEAVER, Esq., Ballard Coombe, Coombe Warren, Kingston-on-Thames.

Mr. H. S. BLACKWELL, for more than 3 years Foreman at Cheveley Park Gardens, Newmarket, as Gardener to H. D. BROUGHTON, Esq., Beech-Hurst, Andover, Hampshire. (Thanks for donation of 2s. for R.G.O.F. box.—Eds.)

Obituary.

J. J. WILLIS.—We learn with sincere regret of the death of Mr. J. J. Willis, of the Rothamsted Experimental Station. Mr. Willis, who was 69 years of age, died on Wednesday, July 26, after a long illness. For 40 years he had been Botanical Assistant and Superintendent of the agricultural field experiments at Rothamsted. During this time he had witnessed, and in no small measure contributed to, the important work carried out by that station. Mr. Willis, despite the arduous nature of his official work, found time to write in a pleasing and simple manner on horticultural subjects. He was also co-author with Mr. J. C. Buckmaster of a work on the elementary principles of scientific agriculture. It was specially with reference to manures and manuring that Mr. Willis was an expert, and the series of articles on these subjects in Thompson's *Gardeners' Assistant* and those in Cassell's *Dictionary of Gardening* are from his pen. Mr. Willis took an active part in the life of the neighbourhood in which he lived so long. He was one of the early members of the Harpenden School Board, was honorary secretary to the village institute for 20 years; worked as teacher and superintendent in the Boys' Church Sunday School for no less than 40 years; was a member of the church choir and Secretary of the Temperance Society. Mr. Willis did all in his power, not only to make village life better and happier, but also to inculcate in his neighbours his own love for horticulture. He lectured in the various towns of his neighbourhood on agricultural and horticultural subjects, and was secretary of the Harpenden Horticultural Society for 28 years.

DAVID BUCHANAN.—The death of my father, David Buchanan, occurred on June 16, at the age of ninety years. He was, I believe, one of your earliest contributors. The gardens in which he was employed include: The Grange, Kilwinning, Ayrshire; Hanworth Park; Swallowfield, Berkshire; Bythe Hall, Norfolk; Botanic Garden, Regent's Park; Tanderage Castle, Ireland; Groom's Nursery, Clapham; Dyrham Park, Barnet; Sherwood Park, Tunbridge Wells. He came to Queensland, and was appointed manager of the first State Nursery. He retired from active work about ten years ago. *Frank Buchanan, Foreman, Sugar Experiment Station, Mackay, Queensland.*

*** The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction in this Journal.

BEGONIAS UNHEALTHY: *W. E.* The roots are badly infested with eelworm. It is not advisable to try to save the plants, as the pest cannot be eradicated at this stage. They should be burned, and the soil in which they were growing sterilised by baking.

DESTRUCTION OF POND WEEDS: *H. W.* Sulphate of copper will destroy Algae and certain weeds in ponds. First procure a correct estimate of the quantity of water to be treated, and then use the sulphate of copper in the proportion of 1 lb. to 100,000 gallons of water. Place the powder in a bag and draw the bag over the surface of the water, so that the chemical will be evenly distributed. The quantity of copper sulphate advised will not injure Nymphaeas. It may be necessary to repeat the application once or twice during the season. Failing this, raking frequently is the only means of keeping the water clear of weeds.

EMPLOYMENT AT KEW GARDENS: *H. H.* Apply to the Director, Royal Gardens, Kew, for a form of application. Names of applicants are entered in a book, and men whose capabilities are considered suitable are written to when there are vacancies.

FIGS: *R. O. F.* To fruit Figs satisfactorily, especially in the open, the ground should be firm and poor in quality; the trees frequently do best when planted by the side of a gravel path facing south or west. When carrying heavy crops of fruit, the trees should be liberally watered, using liquid manure water frequently. The growths should be kept well thinned and the foliage syringed thoroughly. We know of no special work dealing with the Fig.

NAMES OF FRUITS: *South.* The specimens of Apples were too immature for naming. Send fruits again later in the season.—*E. Lazenby.* Apple Red Astrachan.—*G. Miller.* Apples: 1, The Queen; 2, Jolly Beggar.—*Dr. P., Tenerife.* The Peach is probably one of the Blood Peaches; such as you sent in June last. The specimen had turned black, and was not in a good condition for identifying.

NAMES OF PLANTS: *John E. Parker.* Echium vulgare.—*A. W.* 1, Lysimachia vulgaris; 2, Sidalcea candida; 3, Epilobium hirsutum; 4, E. angustifolium; 5, Anthemis inodora var. flore plena; 6, Polygonum cuspidatum.—*K. & B.* Asclepias syriaca (Cornuti).—*W. J. W., Ltd.* Probably Lavatera sp., but the specimen was much too withered to be identified.—*B. G. A.* Chironia linoides *Foreman.* 1, Catasetum Darwinianum; 2, Gongora quinquenervis; 3, Oncidium sessile;

THE LATE J. J. WILLIS.

4, Oncidium tetrapetalum.—*D. M.* 1, Veronica spicata; 2, Mimulus cardinalis.—*H. H.* 1, Davallia parvula; 2, Onychium japonicum; 3, Asplenium flaccidum; 4, Hymenophyllum unilaterale.—*P. W. S.* 1, Ceanothus species; 2, Ligustrum japonicum; 3, Pittosporum Tobira; 4, Spiraea Lindleyana; 5, Paulownia imperialis; 6, Erythrina Crista-galli.—*H. W.* Veronica cupressoides var. salicornoides.

"OGDEN'S GOLDEN" PLUM: *W. P. P.* We cannot trace this variety in any work on Plums. If there is no apparent distinction between the two sorts you name, do not exhibit them as separate varieties.

PEACHES DECAYING: *E. L.* The rotting of the fruits is due to Peach mildew. Spray the trees next spring, when the leaves are unfolding, with liver of sulphur, 1 ounce in 3 gallons of water, and repeat the spraying at intervals.

PLANTS FOR A GARDEN ON A CHALK HILL-SIDE: *A. C. B.* Many garden plants will grow well in a chalk soil. Any borders or shrubberies should be trenched 2 feet deep, keeping the top spit of loam on the top. Dear though manure may be, a rail-truck full of horse and cow manure worked in as the ground is prepared will prove profitable. Such shrubs as Privet, Veronica, Lilac, Scotch and Rugosa Roses, Sweet Briar, Syringa, Tamarisk, Escalonia, Euonymus, Pyrus japonica, Myrtles,

Austrian Pines, Osmanthus, Shrubby Spiræas, Cornus (Red Dogwood), Beech, Sycamore and Yews may be planted. Of border flowers select Sweet Williams, Wallflowers, Doronicum, Stocks, Scabiosa caucasica, Pinks and Carnations, German Iris, Campanulas, Helenium, Lupinus polyphyllus, Heucheras, Iberis, Cistus, Coreopsis and Michaelmas Daisies. Nearly all annuals and plants usually bedded may be included. The following plants are suitable for training on walls: Clematis, Climbing Roses, Jasmine, Solanum jasminoides, Penzance Sweet Briars, Ceanothus, and Bignonia radicans. For Roses against walls manure is imperative.

PLANTS FOR SHADY POSITIONS: *L. T.* (a) The following plants are suitable for growing on a shady border:—Aconitum Napellus, A. Wilsonii, Hemerocallis flava, H. fulva and vars., Helleborus orientalis (Lent Lily), Lilium Martagon, L. pyrenaicum, Funkia ovata, F. Sieboldiana, Rodgersia podophylla, Sidalcea candida, Polygonatum giganteum (Solomon's Seal), Convallaria majalis (Lily of the Valley), and Campanula latifolia. (b) For a shady rockery:—Primula denticulata, P. pulverulenta, P. rosea, Gentiana asclepiadea, G. septemfida, Epimedium pinnatum, Saxifraga umbrosa, S. hypnoides, Campanula Portenschlagiana, C. carpatia (turbinata), Arabis alba, Phlox amœna, and P. reptans are suitable.

SOLANUM WENDLANDII: *Z.* This plant may be grown from cuttings inserted in very sandy soil in a warm propagating frame. Use a mixture of good fibrous loam, leaf-soil, and sand for potting the cuttings when they have rooted. Grow them on in a warm greenhouse or heated frame, affording larger pots as required. To obtain small plants for flowering in pots, it will be necessary to stop the growths frequently.

SWEET PEAS: *Anxious.* As you intend to exhibit blooms on August 17, the flowers should be cut to prevent pods forming. Your suggestion to pinch out the points of the shoots may be adopted, as this will improve the size of the flowers and length of stem. Syringe the foliage at night-time. If soot water and manure water is applied to the roots twice a week the colour and substance of the flowers will be improved.

TOMATO BLACK ROT: *G. W. B.* The Tomatos sent us are attacked with the "Black Rot" (Macrosporium Tomato). The disease is sometimes caused by extremes in respect to the affording of water. The use of green manure, or anything that is likely to cause the fruits to crack, should be guarded against. Fruits that show signs of the disease should be removed and burned, and the plants sprayed occasionally with potassium sulphide, particularly when they are setting their fruits. Avoid having too much moisture in the atmosphere, and open the ventilators to renew the air when the weather is favourable. Soil should not be taken from the Tomato house to use for cultivating Potatos, or soil in which Potatos have grown for the cultivation of Tomatos.

TOMATOS NOT RIPENING SATISFACTORILY: *A. B. C.* The hard, unripened patches on the fruits are due to an absence of sulphide of potassium in the soil. The defect is not caused by disease, and may be overcome by watering the roots at intervals of three days with a solution composed of 1 ounce of the substance mentioned mixed in 1 gallon of water.

TRAPPING MOLES: *S. T.* The traps should be set near the ends of newly-made runs, not those which have just been commenced.

TREE CARNATIONS: *E. T.* Tree Carnations will not flower satisfactorily in a temperature of 45° in winter, and although 50° might give satisfaction in some districts, it is better to maintain a temperature of 55°. For pot-culture in a greenhouse we would recommend the following 12 varieties:—Britannia, Carola, Enchantress, Flamingo, Harlowarden, Lady Alington, Lady Bountiful, May Day, Mrs. Burnett, R. F. Felton, White Enchantress, and Winsor.

THE FRAGILITY OF FLOWERS.

THE fragility of flowers is a common-place fact so universally recognised as to have become proverbial. Within the closely-circumscribed limits of suitable conditions, their loveliness may endure for a comparatively long time; but, disturb these conditions, and the petals fall as though by resentful magic! The evanescence of floral beauty is so striking that the poets have made it the example of mortal joy in general:

Pleasures are like Poppies spread;
You seize the flower, the bloom is shed. . .

To the poet and to the ordinary mortal, this capriciousness appears as the inevitable expression of delicate grace—the defect of the quality of loveliness. The man of science, who is apt to seek utility even in beauty, inclines rather to the view that the graces of form and colour of our flowers are but means to ends—lures to pollinating insects—and he searches for the explanation of the evanescence of flowers in terms of usefulness. When their work is done, when the pollen, ensconced on the stigma, begins to quicken into life, the plant, having no longer use for them, casts off the petals or lets them fade. And indeed there is a certain measure of support for this severe and practical view. We know that the fading, or casting off of

petals follows, in many flowers, quickly on pollination, and gardeners resort sometimes to the expedient of removing the stamens and pistils from the flowers whose bloom they wish to preserve for yet a few more days. We may see on all hands how Nature at times sacrifices the beauty of the flower to the imperious need of propagation. Among the Loranthes of tropical countries the flowers remain closed till a bird of bright intelligence comes flying fast against them. Then at the impact the flowers open with an explosive movement, and, in some species, fling their petal lobes and stamens full in the face of the intruder. He, intent on nectar, gives no heed to the dusty rebuff, but seeks the sugary fluid stored in the long tube of the corolla. Then he flies away and commits a like sacrilege on another Loranthus flower and, incidentally, transfers the pollen from the first to the stigma of the second blossom which opens perforce to his assault.

Yet, though such curious facts could be multiplied indefinitely, other and equally curious facts point rather in the direction of the view of the poet and ordinary man and away from the calculating utilitarianism of the man of science.

For example, it suffices only to cover a potato flower with one of the light muslin bags used by the plant breeder for excluding insects from the flowers on which he wishes to operate to ensure the fall of the flower. Nor, be it remembered, is the fall an accidental one, but rather the flower, thus enswathed, is cast off swiftly and cleanly by the formation of a layer of cork in the flower-stalk. The flowers of Sweet Peas are similarly intolerant of the breeder's methods, although, on the other hand, to most flowers, the removal of petals and stamens is a matter of indifference so far as retention of the power of seed-formation is concerned. Most plants suffer the loss of both stamens and pistils without showing signs of premature withering, but in some—*Erodium Manescavi*, for example—a slight damage of the stigma suffices to cause the petals to fall within about an hour. Many are the hostesses who have had to deplore the capriciousness of floral beauty in seeing their table decorations, lovely enough before, fade and fall as soon as the gas was lit. On the other hand, this same capricious casting off of the petals was the designer of a charming scheme of table decoration at a banquet some weeks since. Certain Pelargoniums had been chosen as the flower for ornamenting the tables. The dining-hall was warmed with oil stoves. The fumes no sooner reached the flowers than they began to cast off one by one their petals, which fell upon the cloth beneath and lay there radiant. The florist knows well the frailness of many of the flowers he sells, and introduces skilfully a quick-setting gum, which holds the petals, prone to fall, in their place.

Chief among the agents which excite the plant to cast off its petals are coal gas and carbon-dioxide. Professor Fitting finds, for example, that the traces of coal gas which occurs in the air of ordinary

laboratories are sufficient to cause *Geranum pyrenaicum* to exfoliate its floral leaves in the course of a few hours. Carbon-dioxide is yet more potent, and if only some 4 or 5 per cent. of this gas is added to the air in which the flowers are confined a shower of petals falls in an extraordinary short time.

The older flowers are affected first; within 10 or 12 minutes of their exposure to carbon-dioxide their petals are cast off. The younger flowers react no less certainly, though less quickly, and it may be several hours before they have shed their petals. Tobacco smoke and acid fumes, chloroform and ether are also potent agents in inciting plants to the unnatural deed of discarding their blossoms, and even a transference to a very hot room, for example, one of a temperature of about 40° C. suffices to cause the petals of many plants to fall within a few minutes. Again some flowers succumb in similar fashion to shaking; *Verbascum thapsiforme*, for example, when shaken somewhat vigorously, throws off its petals almost like a Dandelion sheds its fruits.

These reactions are no mere physical reactions; the shaking does not shake the petals off, the warmth does not cause the petals first to fade and then to fall, the gas does not act by first doing violent damage to the plant. They are but agents which serve to stir the plant up to do what might almost be called the deliberate work of exfoliation of petals. Sometimes, indeed, no external agent at all need be called in to produce the premature fall of petals. It is habitual with some flowers to discard their corollas before the constituent petals are fully grown and before the stigma is mature.

The fragility of flowers, then, is a more capricious and subtle thing than either the poet or the man of science is apt to think! At times this frailness appears to be the fault of grace, and at times the sign of the consummation of pollination. Attached by the most delicate rows of living cells to the tissues of the flower-stalk, the petals stand like acrobats on acrobats poised with consummate delicacy, a very little suffices to disturb their unstable equilibrium; slight changes, which occur when pollination has taken place and the pollen grains begin to grow, suffice to signal to the plant to throw off its trappings, which are now rather a hindrance than a help, since they may again lure insects to do the work which has been done already. The leading acrobat, as it were, casts off the lighter members of the troupe balanced on his shoulders. Or a slight external change of conditions, just as it may spoil the human performance, may also bring the petals falling like leaves to the ground. The poet's view is right, that grace must needs be fragile; the view of the man of science is also right, that the plant continues to draw advantage even from the fragility of those members which, for special ends, it constructs and endows with matchless gracefulness. In the present day the man of science is, as he has been always, a pioneer in providing the raw material of facts and ideas for the poets of the time to come.

NEW OR NOTEWORTHY PLANTS.

MONTANOA WERCKLEI, N. SP.*

THIS new species is a shrub about 6 metres high, with large, elegant leaves and white, tomentose branches. The flowers appear from December to January, and although not quite so large and showy as those of *M. bipinnatifida*, are yet very pretty and elegant, each about 2 inches across. They are arranged in broad corymbs on tomentose pedicels.

The tomentum of the branches is of a delicate, almost cobwebby nature. It extends from the branches along the upper margins of the channelled petioles, and is very conspicuous in the younger parts of the plant, but when older it gets washed off, and finally disappears on the old wood.

The leaves have patent petioles 6-7 inches long, with the blade somewhat drooping. This is about 8-10 inches long and broad, 5-7 lobed, with a more-or-less cordate base, near which two little patent or reflexed leaflets are attached, whence the leaf ought to be considered as very unequally pinnate or trifoliate. The leaflets do not exceed $1\frac{1}{2}$ inch in length, and are generally much smaller in the upper leaves, and finally disappear. The leaves are softly pubescent, the lobes pointed and coarsely dentate.

This plant was grown from seeds kindly sent to us by Mr. C. Werckle, of San José in Costa Rica, in 1905. In its native land it is known as *Toona quirita*. The plant grows quickly, and seems to be as hardy as *M. bipinnatifida*, which is much planted along the Riviera, and generally in great beauty at Christmas. *A. Berger*.

CAMASSIA LEICHTLINII.

THE Camassias, which are natives of North America, and quite hardy, are ornamental subjects for borders and beds, and are particularly valuable plants for the wild garden, since they associate excellently with the herbage and are able to hold their own against the natural vegetation. The specimen shown in fig. 56 is the ivory-white form of *Camassia Leichtlinii*, which has a very ornamental effect in the border. The leaves are about 2 feet in length, and the bold flower-spikes, about 4 feet in height, carry nearly 100 flowers, each about 2 inches in diameter, with evenly-disposed, lanceolate petals. The upper 2 feet of the flower-spike is covered with blossoms arranged in a light and graceful manner. The projecting styles and stamens add greatly to the effect of the blossoms. *Camassia Leichtlinii* is very variable, and there are several forms. One, named *alba*, is pure white and a magnificent plant, the blossoms appearing as if frosted. The variety *atrocerulea* bears dark purple-blue, broad-petalled, star-like flowers of large size, and is one of the finest of the Camassias, being stouter and taller than the type. Other Camassias are *C. esculenta*, styled by the Indians, who eat the roots, *Quamash*. The plant grows 18 inches in height, and bears from 20 to 30 purple-blue flowers, each 1 inch across. It is useful for massing in the wild-garden, and grows well in the grass. Of this there is also a white

* MONTANOA WERCKLEI BERGER N.SP. ex affinitate *M. grandiflorae* DC. Prodr. V. 565.—Frutex ramis cylindraceis cicatricibus foliorum annulatis, internodiis 2-7 cm. et ultra longis, in partibus junioribus tomento arachnoideo-lanoso albo dense vestitus, demum glabrescens. Folia opposita, petioli e basi carnosae subsemianplexicauli canaliculati patenti, arachnoideo-tomentosi, folia caulina impari-pinnata vel trifoliolata, foliolo terminali multo majore, reliquis lateralibus fere auriculatis, basi subcordato, 5-7 lobato, lobis ovatis acuminatis subtrilobatis, sinibus obtusis, nervis tribus majoribus subtus prominentibus percurso, crenatodentato, utrinque molliter pubescente, foliola lateralia lanceolata, patentia vel reflexa. Inflorescentia corymbosa multiflora, pedunculis tomentosis, inferioribus bracteis lanceolatis munitis; involucri squamæ exteriores ovato-lanceolatae acutae, hirtae, interiores ovato-cuspidatae; ligulae 8-10 oblancoolatae acutae, 21 mm. longae et 9 mm. latae.

Costa Rica, e seminibus a cl. Carolo Wercklé anno 1905 missis in Horto Mortolensi culta. Floret mensibus, Dec.-Jan.

form. *C. Cusickii* attains to a height of about 4 feet, and the upper 2 feet of the flower-spike is densely studded with upwards of 100 lavender-blue flowers, having yellow anthers. The individual blossoms are starlike in shape and 1 inch in diameter, and are closely packed together. The leaves are glaucous, 2 feet in length, and 2 inches in breadth. The bulb is the largest of any species, and is described as

lanceolate petals. The anthers are very large, rich golden-yellow in colour, and set off the blue of the flowers most effectively. It is the latest of the race to bloom. *C. Brownii* grows 3 feet in height. The flowers of this species are 2 inches in diameter, and lavender-blue-coloured, with many metallic tints on both sides. The richness of the blossoms is due to their changeable hues, according to the strength of the light.

FIG. 56.—CAMASSIA LEICHTLINII FLOWERING IN DEVONSHIRE.

[Photograph by Wyndham Fitzherbert.]

growing on mountain slopes instead of in meadows where the other species are found. It is the earliest of its race to flower, and is sometimes injured by late spring frosts. *C. Fraseri* is a comparatively slender plant 18 inches in height, bearing pale, porcelain-blue flowers less than an inch across. *C. montanum* is intermediate between *C. esculenta* and *C. Leichtlinii*, and produces dense spikes, each bearing about 50 flowers, the individual blossoms being an inch across, and having

The spikes are of noble appearance, and contrast well with those of the *Eremuri*.

The culture of the Camassias is exceedingly simple; they will grow anywhere in good soil, and require but a minimum of attention. They should be planted in good-sized colonies, and not singly, as an isolated specimen has but a poor effect. They appear to excellent advantage when associated with *Eremuri*. Camassias do not produce many off-sets, so that propagation by that

means is slow, but they may be easily raised by the thousand from seed, and the seedlings will reach the flowering stage in their fourth or fifth year. As a rule, the flower-spikes of the Camassias retain their beauty for a considerable time, but this year, owing to the severe drought and heat, they faded in three days. *Wyndham Fitzherbert.*

THE ROSARY.

CULTURAL NOTES FOR AUGUST.

BUDDING may still be done, but it will be advisable to water the stocks for some time after the buds have been inserted as it is essential that the flow of sap shall not cease at this stage. A large proportion of failures in budding may be expected this year owing to the exceptional hot weather. Examine the budded stocks for failures, and insert fresh buds as advised in my last notes. One of the most important points is to continue the application of water to the roots, especially if weak liquid manure has been afforded freely whilst the plants were in full growth, for dry conditions at the roots will favour an attack of mildew; as, indeed, will any sudden change in the treatment of the plants.

The blooms should be removed as soon as their beauty is over, since the formation of seed pods is an exhausting process. Summer pruning calls for attention this month. In doing this work the habit and general characteristics of the individual plants must be taken into account. Most of the strong-growing varieties bloom only once in profusion; in their case the old flowering shoots need to be removed with a view to securing long healthy growths of the current year for next season's blooming. The shoots of *Crimson*, *Blush*, and *Philadelphia Ramblers* need thinning, removing the old flowering branches, which are now of little value. *Dorothy Perkins* and others of the same type should have the exhausted wood removed, to favour the development of the new growths, and prevent overcrowding. Some few of the *Wichuraiana* Roses such as *Madame Alice Garnier*, *Delight*, and *François Foucard*, are more constant in blooming, and these must be pruned carefully. Many Roses trained on walls and arches may be thinned with advantage at this stage. In the cases of *William Allen Richardson* and *Madame Alfred Carrière* it would be unwise to cut away many of the shoots because they flower well on lateral growths.

PROPAGATING ROSES FROM CUTTINGS.

Half-ripened shoots suitable for cuttings are plentiful this season. Do not make the cuttings too long, and plant them deeply in a partially-shaded border, in a sandy loam, which must not be allowed to become dry. Shoots of *Tea*, *China* and certain of the strong-growing varieties of other types will root freely during August and September, but I prefer to plant in August if suitable shoots are available. Where the planting of beds of Roses is contemplated and the ground already available, the preparation for the work may be commenced. Deep digging should be practised; bastard trenching being advisable. The subsoil should be drained if necessary, although this is not practised by rose-growers so frequently as formerly. Incorporate a good quantity of manure in the bottom of the trench, nothing being better than pig dung, the next best material being well-rotted farmyard manure. Much will depend upon the nature of the soil; if it is stiff and heavy, use lighter manures, such as bone-meal, soot and decayed vegetable matter. I am much in favour of crushed bones being placed at the bottom of the trench, as these are very lasting in their manurial

qualities and are very mild. After the Roses are planted they may be fed by surface dressings, which gives better results than planting in a rich compost. The top spit of soil may with advantage be turned over again after a few weeks, but take care to make the soil fairly firm again before planting.

In the case of Roses under glass very little work is needed beyond making preparations for the earliest batch of plants from the open. Roses may be unfastened from back walls, the brick-work or boards whitewashed, and the house cleansed in view of the re-housing of the pot plants. If needed, a colour wash may be used instead of whitewash. *Practice.*

TEA ROSE MISS ALICE DE ROTHSCHILD.

THIS variety is one of the best of the recently-introduced Roses. It has been described as a dwarf *Maréchal Niel*, which, I think, is fairly correct in some points. There is not a hardy *Tea* variety in cultivation that resembles *Maréchal Niel* so much as does the variety in question, especially in the perfume of the flowers.

Miss Alice de Rothschild is a fairly strong grower, and a profuse and continuous bloomer; the flowers are large, full, with pointed centres, and borne on straight, upright stems. The colour is rich, deep citron-yellow. During the present season I have seen this variety doing remarkably well in one of the coldest spots in Scotland. *Miss Alice de Rothschild*, when more widely known, will, no doubt, be cultivated extensively. *Chester Parker.*

THE BEST YELLOW ROSE.

ON page 92 Mr. G. M. Taylor refers to a Rose near to *Rosa pimpinellifolia lutea*, but with flowers of a deeper yellow. Perhaps he means *R. altaica*? I quite agree with him that *R. Ecae* is quite different to *R. xanthina*. But, in my opinion, the best, or at least the most extraordinary of all the yellow Roses is *Rosa berberifolia*, a species with one leaflet only; the flowers are small, but each petal has, at its base, dark brown spots which contrast with the beautiful yellow colour. The plant is a curious shrub, quite distinct from every other Rose, and not very difficult to grow. It requires a sunny, dry position. *H. Correvo.*

THE GARDENS AT BISLEY.

STRANGE as it may seem, there is a close relationship between soldiering and gardening—the extreme arts, martial and peaceful. Soldiers have always been gardeners, and many of the Persian kings employed their small amount of leisure between campaigns in forming gardens, or paradises as they often styled them. *Cyrus*, the younger, boasted to *Lysander*, the Spartan general, when the latter admired the garden at *Sardis*, that he was responsible for the conception of that beautiful garden, and that he had planted with his own hands many of the trees there. The same soldier-emperor had another extensive garden at the ancient royal city of *Celænæ*, where he also possessed a number of wild beasts.

Cimon, the victorious Athenian commander, planted the public garden of *Athens*, transforming a barren wilderness into a beautiful resort. He introduced streams of water, formed many shady groves, and planted a number of trees, especially the *Olive*, *Plane*, and *Elm*, so much admired by the ancients.

It is also on record that the Roman general, *Lucullus*, famous for his great wealth and luxurious mode of living, who introduced the *Peach*, *Cherry*, and *Apricot* from the East, made magnificent gardens in the Bay of *Naples*. Nearly every Englishman is by nature a gardener, and our own soldiers, when at foreign stations, frequently struggle against adverse circumstances in their endeavours to form gardens.

In the Indian cantonments a garden of some sort, even though it only consists of standard *Crotons* growing in tubs, is looked upon as a necessity. Besides being gardeners, many soldiers are expert botanists, and *Kew* owes much to them for their researches when on foreign service.

When we remember all this it is not surprising to find that gardens abound at *Bisley*. It is not, as many people suppose, merely a temporary canvas town. The social side of *Bisley* is great, the various affiliated rifle associations have their permanent club-houses, and a number of members of the *National Rifle Association* have built bungalows. Twenty years ago the site of *Bisley Camp* was occupied by farms. When the Council of the Association bought the freehold and planned their buildings they wisely considered the comparatively few trees which were growing there. A big dividing hedge had some fine *Hollies* growing in it, so the ground between the trees was levelled and the *Hollies* were left on mounds. Since then these trees have grown and now they diffuse a restful greenness as well as afford a grateful shade. Avenues and single rows of such trees as the broad-leaved *Elm*, *Poplars*, and the *Spanish Chestnut* have been planted by the sides of the chief thoroughfares and, considering the poorness of the soil, these trees have made surprising growth.

In the hollows, much of the natural vegetation remains, the *Heathers* have just commenced to bloom, in association with *Furze* and *Bracken*.

The largest, and probably the best garden, that of the Council club-house, boasts a well-kept, sloping lawn, with clumps of trees and shrubs, chiefly with restful green foliage, brightened here and there with *Golden Yews*, the purple-leaved *Maple*, and other striking trees. The supports of the large verandah are covered with ornamental Vines, *Jessamine* in full flower, and Ivy-leaved *Pelargoniums*. An endeavour has been made to grow the *Crimson Rambler Rose* but, except where fresh soil was imported, the attempt has not been very successful. In such a sandy soil—frequently nothing but sand and stones—*Hiawatha* would thrive much better; it is astonishing how any Rose of the *Wichuraiana* type will grow in even pure sand. Freshly-painted tubs containing flowering plants, such as *Pelargoniums*, *Sweet Peas*, and *Hydrangeas*, are placed at intervals along the gravel walk, and these plants add much to the beauty of the scene.

Shrubby Conifers, including *Retinospora pisifera*, and *Cupressus Lawsoniana*, grow very freely in this poor, sandy soil, and the foliage assumes a rich, green colour.

Another garden has a judicious mixture of Japanese *Maples*, *Marguerites*, and various *Pelargoniums* flowering freely and well, relieved by the cool green of *Yuccas* and *Lastreae*. This year *Capt. J. F. Davies* has commenced quite an ambitious garden with flower-beds and borders, and a well-made *Larch* pergola, which is already becoming furnished with cluster *Roses*. *Petunias*, *Fuchsias*, and *Nemesia*, provide masses of bloom. There is also a long row of *Sweet Peas*.

The *Army Rifle Association* has a spacious club-house which makes a cool and shady retreat. Numbers of well-flowered baskets, containing *Petunias*, *Pelargoniums*, *Lobelias*, and *Fuchsias*, hang from the verandah. Many other club-houses are adorned in similar manner; some have standard H.P. *Roses* planted in their gardens, but as a rule these are only a partial success. *Teas* and *Hybrid Teas* would be more suitable. Hanging baskets of plants, which are well attended to and are flowering freely, enter largely into the schemes of decoration at *Bisley*. Many of the tents at the *Members' Camp* have groups of summer bedding plants at their entrances, and similar groups, fresh and bright, are also frequent alongside the trade marquees in the Bazaar. *A. C. Bartlett.*

THROUGH LITTLE NAMAQUALAND WITH THE VASCULUM AND THE CAMERA.*

(Continued from p. 62.)

THE centre of the Khamiesberg lies a few miles to the south-east of the Sneeuwkop. As we approach the heart of the range, we ascend a natural staircase, of which the top of each step is a plateau of considerable size. The greater part of the range is a native reserve, and where the surface is reasonably level a good deal of Corn is cultivated. The condition of the crops suggests that the land is suffering from exhaustion, much of it, no doubt, to so great an extent that its reclamation is no longer practicable. The old Wesleyan Mission station, known as Leliefontein is situated on the most elevated of these plateaux, at 5,000 feet. In its immediate neighbourhood are hills rising at least to 5,500 feet. The natural vegetation above 4,000 feet proclaims its affinity with that of the Cape. The most notable species at 5,000 feet and upwards is a tall-spreading bush, described from Drege's specimens as *Leucodendron cartilagineum*, since transferred to the genus *Leucospermum*. It is not a strikingly handsome plant, but its greyish-green foliage and somewhat stiff deportment at once distinguish it from the surrounding vegetation, and suggest a relationship with the *Protea* family. It is no doubt identical with a bush whose charred skeleton was found on the upper slopes of the Sneeuwkop, and, indeed, it appears to be the only member of its family in the Khamiesberg. Associated with it are a *Chironia* (*Gentianaceæ*), with bright pink flowers, *Erica Plukenetii*, and another Heath, with charming little white bells, of which a purple-flowered variety was previously seen on the middle slopes of Sneeuwkop. The view in fig. 57 was taken from a hillside north of Leliefontein. In the centre of the picture is the greater part of the mission station, and beyond it, on the right, the great mass of Ezelskop, the summit of which is about 5,500 ft. above the sea. It is not certain that Drege visited Leliefontein, though the nature of the country and the fact that the mission station was established in 1816 make it probable that he did. However this may be, he records that, on November 7 and 8, 1830, he

laceum, *Oxalis arcuata*, *Phyllis*, *Elytropappus Rhinocerotis*, *Wahlenbergia Meyeri*, *Erica Plukenetii*, *Leucadendron cartilagineum*, *Passerina rigida*, *Struthiola virgata*, *Disa draconis*, *Moræa*, *Ixia*, *Hypoxis aquatica*, and others which are

The problems of plant distribution in south-west Africa are of particular interest and, perhaps, exceptional difficulty. We find a flora of strongly-marked Cape affinity on the Khamiesberg, a range separated from the mountains of

FIG. 58.—NAMAQUALAND.

Mesembryanthemum digitiforme in the Karree Desert, north of Van Rhyni Dorp.

unknown in the arid plains of lower Namaqualand.

Leliefontein is reached after a series of laborious ascents; the return to the low country is not without a little danger. But, after weeks spent in toiling across the hot, waterless plains and rough hills of Namaqualand, the glorious climate and abundant water of the Leliefontein plateau are a more than sufficient recompense for the difficulties passed and to come. Prominent

the Cape region by a formidable stretch of desert. A thousand miles away to the north, *Proteas* and other Cape genera reappear on the Huilla plateau, in South Angola, at 6,000 feet. A *Restio* and other Cape plants occur on the summits of the lower hills of Namaqualand between the Khamiesberg and the Orange River. The greater heights of German South-west Africa, as yet botanically unknown, or only partially explored—the Awas Range (7,000 feet), the higher peaks of the Komab Plateau (8,000 feet), Ombotoza (7,000 feet), Omatako (8,800 feet), the Great Karas Berg (6,000 feet)—these may be expected to furnish links between the patches of Cape vegetation on the Khamiesberg and the Huilla Plateau. But, however numerous the links, they will not form a chain.—We shall still have a number of “islands” bearing vegetation of southern affinity, separated by a sea of arid plains, and hill-ranges with plants of an entirely different type. Are these islands of Cape vegetation the remnants of a flora once continuous, which, under stress of a changing climate and the invasion of forms better adapted to live under more vigorous conditions, has been exterminated, except on the upper slopes of the higher mountain ranges? If so, whence and by what route came the invaders whose descendants now inhabit the lower levels of the coast-belt between the mouth of the Oliphant's River and Benguela—a collection of plants whose peculiarities of form, structure and manner of life are hardly to be matched in any other existing flora? These and similar problems may, perhaps, be solved in the future, when our present knowledge of the botany of this great region has been vastly increased. To-day, although of the highest interest, they are little more than subjects for speculation.

In the low country from which the mass of the Khamiesberg rises, excluding the sandy plains of Bushmanland, our attention is at once claimed by the succulents. Whether they flourish to the practical exclusion of all other types of vegetation, or are mingled with low bushes, of which neither the stems nor the leaves are conspicuously fleshy, there is no doubt that,

FIG. 57.—NAMAQUALAND.

View over Leliefontein Mission Station, looking south. Ezelskop in the distance to the right. The vegetation in the foreground includes a large proportion of *Rhenoster Bush* (*Elytropappus Rhinocerotis*).

made observations “at the foot of the Mountain Ezelskop, looking towards Leliefontein.” Here his collections included *Pelargonium stipu-*

among the impressions left by a visit to the Khamiesberg are pleasant memories of the kindly welcome and generous assistance which a somewhat jaded expedition received at Leliefontein from Rev. W. M. Crampton, the missionary in charge of the station.

* Being some notes on the Percy Sladen Memorial Expedition to the Orange River, 1910-11. This expedition was assisted by a grant from the Royal Society.

from one end of Namaqualand to the other, below 3,000 feet, they constitute the predominant type of vegetation. They are particularly well developed in the stretch of desert already mentioned (The Karree), which separates the Khamiesberg, on the north, from the northern spurs of the Gifberg, Matsiekamma, and Oliphant's River Mountains, on the south. Conspicuous among them are the genera *Mesembryanthemum*, *Crassula*, *Cotyledon*, *Augea*, and *Anacampseros*. Some of the *Mesembryanthemums* possess the most peculiar forms. Not the least remarkable of these is shown in fig. 58. It is believed to be *M. digitiforme*, a species collected and described by Thunberg, but said to be absent from his own herbarium. The erect stems are very short, and bear one to three leaves, of which the uppermost and youngest resembles a very corpulent finger. They contain much water and are very soft, so that a dried specimen can give but little idea of the natural appearance of the plant. From the broad, sheathing base there emerges the small, delicately-white flower which is visible in the illustration. A group of these plants is seen in fig. 59. They, like so many other members of the genus, are very local in distribution. They were only found in a few small patches in this stretch of desert, where, apparently, Thunberg's specimens also were obtained. Of two other *Mesembryanthemums* shown in fig. 60, the one with the stiff, erect leaves has a wide range. It is a very common plant in Western Bushmanland; in Namaqualand it extends almost as far north as the Orange River, and, no doubt, occurs again beyond it. Some of its large, dry fruits may be seen in the illustration. These are tightly closed so long as the air is dry, but they quickly open when wetted by the rain—a behaviour well known to be characteristic of the capsules in this genus. A second species may be seen a little below and to the right of the centre, in fig. 60. Its resemblance to the stones among which it grows is so close that the plant is easily overlooked. It is now in a quiescent state; two young, green and fleshy leaves lie concealed in the shrivelled bases of those of the previous season; these, together,

a later contribution. Even the most cursory account of the succulents of this region must not omit to notice that curious plant *Augea capensis* (*Zygophyllaceæ*) (see fig. 61), which, despite its wide area of distribution, has been very little

FIG. 60.—NAMAQUALAND.
Two striking species of *Mesembryanthemum* in the Karree Desert.

studied. It occurs in sandy and often saline soil in the Karoo, the plains of Western Bushmanland, and Namaqualand, and northwards into the tropics. Its stout, glaucous leaves contain a great deal of water, which is intensely saline to the taste. Its flowers are white and not remarkably conspicuous; its very numerous fruits are curiously like the leaves. In the young condition, they are very succulent, but, when ripe, they

FIG. 59.—NAMAQUALAND.

form the little balls which stand one at the end of each short stem. Perhaps the most striking of the *Mesembryanthemums* met with—*M. Barkleyi*—occurs near the northern edge of this desert, but it is found in much greater profusion farther north, and it will be more suitably described in

break up into 10 dry parts, each containing a single seed. Each segment resembles a seed with a double wing. The manner in which this wing is formed is peculiar, and will be described later.
H. H. W. P.

(To be continued.)

NOTICES OF BOOKS.

RURAL LIFE AND SCENES.*

WE can appreciate the bewilderment and displeasure of the old farmer who, having seen Ruskin's *Notes on the Construction of Sheepfolds* on a bookstall, purchased it with a view to improving his mind on a subject dear to his heart. A somewhat similar surprise awaits those who acquire Mr. Hurst's book, and would learn much about *Quercus pedunculata* and *Q. sessiliflora*. But there the likeness ends. The reviewer will confess to having read this work at a single sitting with the deepest enjoyment. It is really the story of an enthusiast for the British Oak who, on a spring day a few seasons ago, set out with some hundreds of Acorns in a box and carefully planted them as he perambulated the country in the spots where they would be most likely to thrive. The journey commenced near Manchester, and after trudging leisurely into the Peak district of Derbyshire, and spending much time on the banks of the Trent, Mr. Hurst found his way through Leicestershire and Rutland to Stamford, whence he returned home. He seems to have spent some three months on the journey, shunning towns and staying at farms, cottages, and country inns. To those who know and love the country the story of his adventures will make a strong appeal, for it is written with insight and humour. In the early stages of his pilgrimage he encountered and adopted a marvellous mongrel dog with the oppressively affectionate disposition common to its kind. The two wandered on

FIG. 61.—NAMAQUALAND.
Augea capensis growing in the Karree Desert. The plant is 2 feet high; this size is rarely exceeded.

with an increasing love and mutual understanding until a motor-car put an end to the career of the author's companion. It was the grief engendered by this tragedy that brought to a sudden end a journey which was intended to embrace the south and west of England.

It would be unfair to leave it to be concluded that the book justifies its title no more than is suggested by what has been written above. It does, indeed, contain 14 full-page illustrations of famous or remarkable Oaks with descriptions of them and their traditions. And, scattered here and there through its pages, are a few facts or theories concerning Oak timber, its age, uses, &c. But it is not for them one reads the book. It is for the picture it gives of English country scenes in spring and summer, its humorous appreciation of rural character, and for the occasional deeper note it reaches in the contemplation of nature's eternal mysteries.

* *The Book of the English Oak*, by Charles Hurst. (London: Lynwood & Co.) 5s. net.

THE FLOWERS OF CHAUCER.

(Continued from page 107.)

OAK.

1. With the leste strook
It seemeth as it wolde felle an ook.
Knights Tale, I. 143.
 2. A corone of a grene ok cerial
Upon hir heed was set ful fair and meete.
Ib. 163.
 3. And leet comaunde anon to hakke and hewe
The okes old. *Ib. 180.*
 4. Ook, fyr, birch, asp. *Ib. 182.*
 5. Lo the ook, that hath so long norisschyng
Fro tyme that it gynneth first to spring,
And hath so long a lyf, as we may see.
Ib. 185.
 6. Thurghout his armur it wol kerve and byte,
Were it as thikke as a braunched ook.
Squyeres Tale, II. 207.
 7. See ye that ook?
Pardoneres Tale, III. 84.
 8. The bilder oke.
Assembly of Foules, IV. 195.
 9. And by him selfe, under an oke I gesse.
Ib. 197.
 10. In which were okes grete, streight as a line.
Flower and the Leaf, IV. 238.
 11. A company that ware, for their delite,
Chapelets freshe of okes serialle. *Ib. 244.*
 12. As an oke comyth of a littil spire.
Troilus and Cryseyde, V. 102.
 13. The sturdy oke
On whiche men hakkyn oft. *Ib. 104.*
 14. Had yturned his bak
To an ooke, an huge tree.
Boke of the Duchesse, VI. 151.
 15. Maples, asshe, oke.
Romaunt of the Rose, VII. 59.
 16. For no man at the firste stroke
Ne may not felle down an oke.
Romaunt of the Rose, VII. 127.
 17. Asshe, firre, and oke, with many a yonge
acorne.
Complaynte of a Lovers Lyfe, VIII. 8.
- Among the mediæval writers, the Oak was the symbol of strength, endurance, and long life. In Nos. 2 and 11 "Cerial" and "Serialle" are supposed to refer to the Turkey Oak (*Q. cerris*), and in No. 8, "the bilder oak" refers to its use in building. Spenser uses the same descriptive epithet.

OATS.

He schal have multiplying of his grayn,
Whan he hath sowen, be it whete or otes.
Prologue of the Pardoner, III. 70.

OLIVE.

1. Thay brent alle the cornes of that lond,
And alle her olyvers and vynes eeke.
Monkes Tale, III. 183.
2. The olive of peace.
Assembly of Foules, IV. 195.
3. With cipres, and with olyvers,
Of which that nygh no plente heere is.
Romaunt of the Rose, VII. 59.
4. Pyn trees, cedres, and oliveris. *Ib. 57.*

Chaucer must have seen the Olive in Italy; but No. 3 shows that it was a rare tree to him, though it was introduced into England perhaps before his time. But it was well known to English writers, probably from the frequent mention of it in the Bible.

ONION.

Wel loved he garleek, oynouns, and ek leekes.
The Prologue, I. 103.

PALM.

1. Bothe with the palme of martirdom
Ye schullen come unto his blisful feste.
Secunde Nonnes Tale, III. 14.
2. The palme of martirdom for to receyve.
Ib. 15.

3. The victor palme.

Assembly of Foules, IV. 195.

In heathen writers the Palm is the emblem of victory. Christian writers adopted it, but transferred the victory to martyrdom.

PARSLEY.

For thy persly they faren yet the wors,
That they have eten with the stubbil goos.
Cokes Prologue, I. 235.

PEACH.

Many homly trees ther were,
That peches, coynes, and apples beere.
Romaunt of the Rose, VII. 59.

As Chaucer classes the Peach with Chestnuts and Apples among homely trees, it seems as if he was acquainted with it; but it is very doubtful if the tree was in England in his time, and his is the first mention of it in English literature.

PEAR.

1. And thus I lete him sitte in the pirie.
Marchaundes Tale, II. 192.

2. I most han of the peres that I see,
Or I moot dye, so sore longith me
To eten of the smale peris greene.
* * * *

Wolde ye vouchesauf, for Goddes sake,
The piry inwith your armes for to take.
Ib. 196.

3. Medlers, plowmes, perys, chesteyns.
Romaunt of the Rose, VII. 59.

PEAS.

He poureth pesen upon the hacches slidre.
Legende of Good Women, VIII. 65.

A plañ of the sailors to make the decks
slippery by scattering Peas on them.

PELLITORY.

His forhed dropped as a stillatorie
Were ful of plantayn and of peritorie.
Prologue of the Chanounes Yeman, III. 25.

The name was given to many plants of supposed medical virtue, especially for toothache. The Pellitory of Spain was of high repute, but the name was often applied to our wall Pellitory (*Parietaria*), common on old walls.

PERIWINKLE.

1. Ne violete, ne eke pervinke.
Romaunt of the Rose, VII. 43.
2. There sprang the violete alle newe,
And fresshe pervinke riche of hewe.
Romaunt of the Rose, VII. 60.

Pervink, a word of uncertain derivation, was from very early times the name of the pretty plant which, in the 16th century, gradually developed into its present name of Periwinkle.

PINE.

1. Of Pluto and of Proserpyne,
That quene ys of the derke pyne.
House of Fame, VI. 243.
 2. On pyn trees, cedres, and oliveris.
Romaunt of the Rose, VII. 57.
 3. With many high lorey and pyn. *Ib. 59.*
- See also "Fir."

In Chaucer's time, Fir and Pine were synonymous, and the only Conifer known was the Scotch Fir. How far that extended into southern England is uncertain, but it was probably scarce. Turner, in 1518, said of it: "Pynes growe fayrest in gardynes. There groweth one fayre one in Richmund."

PLANE.

1. Wilw, elm, plane.
Knights Tale, I. 182.
2. Maples, assche, oke, aspe, planes longe.
Romaunt of the Rose, VII. 59.

The Plane tree, now so common, is from

Eastern Europe, and was not introduced into England till after Chaucer's time.

PLANTAIN.

His forhed dropped as a stillatorie
Were ful of plantayn and of peritorie.
Prologue of the Chanounes Yeman, III. 25.

Plantain has many old English names, but Chaucer is the first to use the name derived from the Latin *plantago*. It had a high reputation as a styptic.

PLUMS.

Medlers, plowmes, perys.
Romaunt of the Rose, VII. 59.

POMEGRANATE.

There were, and that wote I fulle welle,
Of pomgarnettys a fulle gret delle;
That is a fruyt fulle welle to lyke,
Namely to folk whanne they ben sike.
Romaunt of the Rose, VII. 58.

A beautiful southern tree, found in Early English literature, from the mention of it in the Bible, and perhaps grown in England in Chaucer's day. Turner says that there were "certyn in my Lordes gardine at Syon," in 1548. It has made its mark on the English army in the hand grenades, and in the representation of the fruit on the collars of the Grenadiers.

POPLAR.

1. Aldir, holm, popler.
Knights Tale, I. 182.
2. Fyne ew, popler, and lyndes faire.
Romaunt of the Rose, VII. 59.

Both name and tree are foreign. The name is from *populus*.

PRIMROSE.

1. Sche was a primerole, a piggesneyghe.
Milleres Tale, I. 195.
2. The floures bright,
The primerose, the violete, and the gold;
Court of Love, IV. 183.

It is doubtful whether the Primerole of Chaucer was our Primrose or Cowslip.

QUINCE.

Peches, coynes, and apples.
Romaunt of the Rose, VII. 59.

Coynes and Quince are variants of the same word, both early traced from the Latin *cydonia*. The Quince was brought into English gardens early, and was much prized, both for its beauty and wholesomeness. *H. N. Ellacombe, Bitton Vicarage, Bristol.*

(To be continued.)

PLANT NOTES.

LAVATERA OLBIA.

LAVATERA OLBIA is one of the most ornamental and satisfactory of Malvaceous plants for garden culture, always attracting attention when in flower and growing with great facility. It forms a small, quick-growing shrub of from 5 to 10 feet high and of several, but not usually of many years duration. It grows readily from self-sown seed. In the Cambridge Botanic Garden it grows at the margin of a copse, which it enlivens with its bright pink flowers, but it is in the open perhaps that it flowers most profusely. The flowers of individual plants vary both in the size and brilliancy of colour, so that it is well worth practising selection with a view to improvement. Individually in form and dimension the blossoms are not unlike those of *Hibiscus syriacus*. The plant has an attractive habit and good foliage, and even when not in flower is ornamental. It is an excellent subject for the wild garden. The species is a native of the South of Europe, and has been grown in the Botanic Garden, Cambridge, for many years. *R. Irwin Lynch.*

KEW NOTES.

THE ROCK GARDEN AND HERBACEOUS BORDER IN MID-JULY.

THE middle of July is late for visiting the rock garden, which is at its brightest appearance during May and June, but some plants, which were not without their attractions, were still in flower there at this date. A rather large number of Campanulas were in bloom, including the little blue *C. pulla*, the purple *C. Stansfieldii*, a large colony of *C. longistyla*, with purple flowers borne on stems from 2 feet to 3 feet in height, *C. Raineri*, *C. phytidocalyx*, *C. G. F. Wilson*, a deep purple variety, *C. carpatia turbinata*, *C. carpatia venusta*, the rare *C. punctata*, with long, white flowers spotted with purple in the interior, and *C. sibirica*, the last-named forming little bushes of purple flowers. The white *Gazania pygmaea* and the yellow *Gazania pygmaea lutea* were pretty, whilst *Pentstemon Jamesii*, with heads of lavender-blue flowers with white throats, about 6 inches high, was also attractive. *Brodiaea congesta*, with clusters of white flowers on stems nearly 3 feet high, was pleasing, as was *B. hyacinthina*, with heads of rather small, white blossoms. *Gentiana Freyniana*, the deep blue flowers about 1 inch across, four in a cluster, carried on stems a foot high, is a rare species, and *G. altaica*, with small, pale-blue flowers borne in a many-blossomed cluster, an uncommon one. A very fine plant observed in a damp spot was *Rodgersia pinnata*, the flower-heads of small, pinkish-white blossoms over a foot in length being borne on stems nearly 6 feet in height. The leaves are divided into five corrugated leaflets, which are green edged with red. A pretty and interesting little plant was observed in *Grammanthes gentianoides*, with brilliant orange, starry flowers less than 6 inches in height. This is stated to be a half-hardy annual. *Malvastrum campanulatum* was somewhat straggling in habit, but its small, bluish-pink flowers with white centres were very pretty. *Sedum sempervivum*, with heads of crimson flowers borne on stems 5 inches in height, made a bright patch of colour. The yellow *Linum flavum* was very bright, and the white *L. arboreum* was also in flower. Among the Pinks, *Dianthus deltoides* was still in bloom, as was the very popular and beautiful *Phlox divaricata Laphamii*. In the neighbouring walled garden *Oenothera tenuifolia*, about 18 inches high, was bearing a profusion of white flowers, each about 1 inch across, and was a mass of bloom. It is a most valuable garden plant. The herbaceous border was very bright. One of the most charming plants observed was *Salvia nemorosa*, with crowded spikes of small, purple flowers borne in prodigal abundance. It is a most attractive border plant. A great bush of *Galega Hartlandii*, with pink and white flowers, was handsome, as was *Clarkia Brilliant*, which was a splendid show of rose-pink. A colony of *Delphiniums* was a little past its best, but the Hollyhocks, crimson, pink, and white, were in full flower and showed no sign of disease. Three handsome yellow flowers were *Helenium autumnale magnificum*, *Achillea filipendula*, and *Senecio Doria*. *Lavatera cashmeriana* has pretty pink blossoms. The border was filled with Carnations, *Antirrhinums*, *Begonias*, Stocks, *Nasturtiums*, *Gazanias*, *Pentstemons*, *Nemesia*, *Cuphea*, *Potentillas*, *Oenotheras*, *Calceolarias*, and *Alonsoa Warscewiczii*, and these presented a showy and attractive appearance. In a narrow border in front of a greenhouse was a very healthy colony of *Gerbera Jamesonii*, with considerably over 100 expanded blossoms, and in the same border were *Crinum Powellii* and *C. P. album*. I observed a very handsome Lily in *L. sutchuenense*, the brilliant orange flowers being spotted in the interiors with small blackish-purple dots. *Wyndham Fitzherbert*.

FOREIGN CORRESPONDENCE.

THE GERMINATION OF JUNIPER SEEDS.

I CONTRIBUTED to *Gardeners' Chronicle*, July 7, 1906, and March 2, 1907, notes on the rare Conifer, *Juniperus Cedrus*, and the difficult germination of its seeds. I have since paid much attention to the subject, but, so far, I cannot say, after mature experience, that the method recommended by me then, of immersing the extracted seed in plain water for a week or a fortnight, at a temperature of about 65° or 70°, is infallible. All that I can say is that some seeds germinate much better after this immersion than untreated seeds.

Remembering my experiences with the Tagasaste seed (*Cytisus proliferus* var. *palmerensis*), particulars of which were published in the *Revue Horticole d'Algerie* in 1898, I tried, two or three years ago, boiling the berries of another Juniper (*Juniperus bermudiana*), of which I have much more seed at my disposal than of the almost extinct *Juniperus cedrus*. I began by

[Photograph by R. Irwin Lynch.]

FIG. 62.—SYMPHYTUM PEREGRINUM: FLOWERS BLUE.

boiling them for 20 seconds and upwards; the results were negative. Only one of the seeds germinated, but the untreated berries sprouted in due course. None of the berries boiled for over 20 seconds sprouted.

The authorities of the Forestry Department, U.S.A., kindly lent me, a few days ago, a thesis presented at the Yale School of Forestry, in which, amongst other so-called difficult seeds, experiments had been made with germinating those of the Red Cedar (*Juniperus virginiana*), and all the different means tried had failed, including boiling water.

The knowledge of these failures encourages me to publish the results of my last experiments made with seed of *Juniperus bermudiana* gathered in the fall of 1909. I weighed lots of about 1 ounce each (30 grammes), and then carefully extracted the small seeds contained in the dry berries, which represent, roughly, about one third of the weight, and, on May 1 of this year, I began my experiments, which have already proved successful, and show that the short im-

mersion of 3, 6 and 10 seconds into boiling water (placing the seed in a small muslin bag, dipping it into the boiling water, and, at the end of the specified time, quickly plunging it into water at 65° to cool, and then sowing it) ensure early germination. The control experiments, with camphor water, with peroxide of hydrogen of different strengths, and soaking in plain water, though apparently helping, have shown themselves far inferior to the immersion in boiling water for a few seconds above described. I have remarked that after 10 seconds boiling not so many seeds germinate as after 3 and after 6 seconds. In the experiments published in the American thesis above referred to, the seed was placed in a tin, boiling water was poured over them, and they were left to soak in the hot water; but this method, no doubt, destroyed the embryos. This was also my experience when I boiled the berries for 20 seconds and upwards.

It may not be out of place here to record that, with Tagasaste seed, I was able, in 1897, to reach the incredible limit of one hour's boiling without destroying all the seeds, and Sir Daniel Morris, who was then at Kew Gardens, wrote to me stating that my experiments had been confirmed, and that even two hours boiling had failed to destroy all the embryos of this extraordinarily resistant seed. Tagasaste had made me careless when I began my experiments with Juniper seed, and, unfortunately, the shortest period of boiling which I employed then was 20 seconds; but now that I have been duly cautious, I think I have succeeded in finding a method which may be of great service to foresters and others interested in the quick germination of Juniper seeds, which, as is well known, lie dormant in the ground for one or more years. It is reported that there is a nurseryman in America who has had for some years a secret and successful method of treating the seeds of *Juniperus virginiana* (the Red Cedar). Perhaps now we shall hear if his secret is any better than my very simple method. *George V. Perez, Puerto Orotava, Tenerife.*

SYMPHYTUM PEREGRINUM.

AMONGST hardy herbaceous plants cultivated in the Cambridge Botanic Garden there is nothing more certain of attracting attention in spring than *Symphytum peregrinum* (see fig. 62). It is a handsome plant for bed and border, but for many years it has proved a great attraction in the shrubberies to visitors, who never fail to inquire its name. For a number of years there was a difficulty in answering the question, but the name has been recently settled at Kew as *S. aspernum*. It is not, however, the plant usually grown under the name, but no doubt from the aggregate-species point of view it is perfectly correct. It differs from *S. aspernum* as figured in the *Botanical Magazine*, tab. 929, apparently in having more slender flowers, but especially in having much narrower sepals. It agrees very nearly, however, with the plant figured in the same work under the name *S. peregrinum* (tab. 6466), which is the *S. aspernum* of Babington, said to have been found wild in England, and for garden purposes this name may, I think, be retained. The *Index Kewensis*, it should be mentioned, refers this figure to *S. aspernum*, but the two figures represent distinct plants. They are very closely allied, however, and equally good no doubt for economic uses. *Symphytum peregrinum* has a strong habit, grows about 3½ ft. high, and when once established in a thicket is certain to continue for many years. It is an exceedingly good subject for the wild garden; the foliage is bold and striking, while the flowers are of a beautiful cerulea blue, being preceded by red-coloured buds. *R. Irwin Lynch.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

ODONTOGLOSSUM.—Plants of the dwarf-habited members of this genus, such as *O. Rossii*, *O. Cervantesii*, *O. Oerstedii*, and their hybrids, *O. Fowlerianum*, *O. aspersum*, and *O. Theodora*, have their growths sufficiently advanced to allow of any repotting or surfacing being done. The plants grow best when suspended from the roof-rafters in well-drained, shallow pans. In common with all newly-potted plants, they are best stood on the stage till established, as the rooting material does not then dry up so quickly as when the pans are suspended. Occasional waterings will suffice to keep the plants sufficiently moist. Any excess of moisture at the roots must be strictly prevented, and especially in the case of *O. Oerstedii*, which is soon injured by too much water.

ODONTOGLOSSUM URO - SKINNERI.—This distinct species and its beautiful hybrids *O. Eleanor*, *O. Groganæ*, and *O. Goodsonii* are all vigorous-growing plants, easy of cultivation. The roots of these are of a more fleshy character than those of most *Odontoglossums*, and this fact must be remembered when repotting or otherwise disturbing the soil. For this reason pots of fairly large dimensions should be used, and they should be drained thoroughly well. A similar mixture to that advised last week for *Cochlidodas* will meet the requirements of these plants, but it should be employed in a coarse state. Few Orchids require more water when in active growth than this *Odontoglossum*, hence the reason for care in the compost and drainage. While the growths are young, overhead waterings should not be afforded, but when the foliage commences to harden, light sprinklings are very beneficial, and assist in keeping down insect pests.

SOBRALIA.—The genus *Sobralia* contains many beautiful species and hybrids, including *S. macrantha* and its variety *Kienastiana*, *S. xantholeuca*, *S. Sanderiana*, *S. Veitchii*, *S. Amesiae*, *S. Holfordii*, and *S. leucoxantha*. The blossoms are very attractive, and although the individual flowers last a short time only, this is amply compensated for by the quick succession in which they appear, for no sooner does one flower fade than another opens, and this goes on until the stem is exhausted. *Sobralias* grow freely and are easily accommodated, for where there is not sufficient headroom for the larger growing specimens on the stage, a corner on the floor may be found for them; and, although preferring a light situation, they will make good flowering growths in shady places where other plants fail to thrive. I have always found these plants grow best in a light and well ventilated structure where a cool intermediate temperature is maintained. During the growing season the plants require copious supplies of water; an occasional application of weak liquid manure made from farmyard dung is very beneficial to root-bound specimens. Even in winter the plants are not entirely at rest, therefore the rooting materials must never be allowed to become dry. The foliage is liable to be attacked by red spider and thrips, especially in a dry atmosphere; for this reason the foliage should be freely syringed even when the plants are not in flower.

REPOTTING.—Most of the *Sobralias* having finished flowering, attention should be paid to their repotting. Being terrestrial Orchids, they should be potted like ordinary plants, and not elevated above the pot rim. So closely do the roots enwrap the compost that it is difficult often to disentangle them, and unless there is a suspicion of decayed material in the centre of the mass, it is much better not to disturb them. In the case of large specimens which have become bare in their centres, or which have old and sour compost about their roots, the plants should be shaken out and divided. It is difficult to per-

form this operation without injury to the roots, but care must be taken to preserve as many as possible of the latter intact. After removing the old rooting material and washing and drying the roots, cut off cleanly all the latter that are bruised just above the point where they are injured. The divided portions should then be potted in receptacles just large enough to accommodate them. The drainage materials should be ample and arranged perfectly. The rooting material should consist of two-fifths good yellow loam, not of the stiffest nature, but light and fibrous; two-fifths turfy peat, and one-fifth leaf mould; the whole should be well mixed together with sufficient gritty material to keep it porous. Use the material in a rough state, and press it very firmly about the roots. In the case of large specimen plants, some of the old growths that have flowered should be removed, severing them close to the roots, thus allowing the young growths that are forming additional room to develop, and at the same time admitting light and air to them.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

THE CONSERVATORY.—In consequence of pressure of work in other departments of the garden, the conservatory will, in many instances, have been somewhat neglected. The training of climbing plants should first receive attention, reducing the growths as may be desirable. A thinning-out of weakly and, in some cases, sappy shoots will be of benefit to other permanent subjects. This will not only produce a tidy effect, but will be conducive to the ripening of the growths of plants that flower in the early spring and summer. In doing this, watch closely for signs of insect pests. Some years since I found at this season a few mealy bugs, after I had believed that all had been exterminated. I did not hesitate to cut out the entire plant. It was a fine specimen of *Tacsonia insignis*, one of the very best of the genus, and was flowering freely at the time. But its destruction was imperative in order to avoid a risk of the bug multiplying. Whenever it is possible, make a free use of the syringe to keep in check other pests, such as red spider and thrips. Where *Selaginella denticulata* is planted as a carpeting to specimen plants, or as edgings to borders, it is well to replant the carpet or border during this month. Even if the plants of *Selaginella* are looking healthy just now, they will, in due course, become too dense to remain in a fresh condition throughout the winter. See that no plants in borders suffer for want of water. If any of the plants are becoming worn out, it is not too late to remove them and plant a fresh stock. In doing this, see that the borders are well drained, and use the best soil available for planting. *Jasminum grandiflorum* is well worthy of a place in the conservatory, and it should be placed at the warmest end of the house. During the dull season of the year this Jasmine will be welcome for the fragrance of its blossoms: the plant is not a very luxuriant grower. With respect to flowering plants in the conservatory, my plan is to reduce their numbers somewhat at this season of the year, when there is an abundance of flowering plants out-of-doors. Their places may be taken by Ferns and many other foliage plants at this season. *Codiaeums* and *Dracenas* that have well filled their pots with roots may be employed until the end of September. These, with such Liliiums as *L. longiflorum*, *L. auratum*, and the varieties of *L. speciosum*, will make a distinctly effective display. The Tuberose is an acceptable plant in the conservatory at this season; so also are the *Daturas*, including *D. suaveolens* (syn. *D. arborea*) and *D. Knightii*. The flowers of these yield a grateful fragrance in the evening. Conservatories have frequently to be closed at the sides, for obvious reasons, during the night, hence it is most desirable to arrange for a constant inlet of fresh air by means of the top ventilators and small apertures near to the ground. I have frequently noticed that, where conservatories are closed, or nearly so, at night, the flowers they contain remain fresh for only a short time. This is not the fault of the gardener, although it is often placed to his account. Where the interior of the conservatory needs painting, there is no more suitable time than the present to do the work.

THE GREENHOUSE.—The best results are obtained with certain greenhouse plants when they are planted out. *Daphne indica rubra* affords an illustration of this. Under pot-culture, this deliciously-scented plant is not often seen in a very thriving condition after it has been shifted into a 6-inch pot; its indifferent appearance may be due to unsuitable soil, want of care in potting, or, what is more likely, careless watering. But it will grow well in a narrow, well-drained border, and it will not matter if it be planted against a somewhat damp wall provided the drainage is in a proper order. The soil should consist mainly of good fibrous peat to which a small proportion of turfy and light fibrous loam may be added. In planting make the soil firm and, after one copious watering, be careful not to afford more moisture than is necessary. Good plants of this *Daphne* in small pots may be obtained from the nurserymen at this season of the year, and these will be very suitable for planting out. I would not hesitate to plant out a specimen that is not in the best of condition, for it might be the means of bringing about a complete recovery of health. *Myrsiphyllum asparagoides*, a well-known and useful plant for decorative purposes in a cut state, will also thrive remarkably well and give a far better return when planted out than when grown in small pots. A suitable place is the foot of a greenhouse wall 5 or 6 feet in height, where each shoot may be trained up a string, thus being easily severed when required. Use chiefly loam in the culture of this plant.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

GATHERING STONE FRUIT.—However trifling this subject may appear to be, it is of sufficient importance to warrant some observations, owing to the fact that it is still the practice of some to allow the fruit to remain upon the tree as long as possible, and sometimes even until it falls. This may be due to the erroneous belief that the fruit has then reached its highest degree of flavour, although, as a matter of fact, fruit loses in flavour two or three days previous to falling, and its eating qualities will deteriorate more and more the longer it is kept. The best time at which to gather the fruit is, in the majority of cases, about three days before it would have fallen from the tree, as it is then at about its highest state of perfection. The principal difficulty appears to be in knowing when the fruit is at that stage, and this can only be determined after a close observation, coupled with a lengthy practice. No stone fruit of any kind should be pinched in order to ascertain if it is sufficiently ripe for gathering, but the Peach, Nectarine, and Apricot are the sooner damaged by pinching. A simple method of ascertaining if a fruit is ready for gathering is to place the hand beneath and gently raise it; if in a proper condition its stalk will part from the branch immediately, but if it is not ripe it will still adhere to the tree.

WALL TREES.—All the leading shoots of wall trees should be nailed or otherwise secured in position as they advance in growth, and those that are not required cut out. This applies especially to trees of Peach, Nectarine, and Apricot, which appear likely to continue growing late in the season. Keep the soil in the borders in a moderately moist condition, but not too wet, as an excess of water applied at this time of the year increases the risk of late growths forming, and retards the ripening of the wood generally. Although insect pests are now practically absent, they may reappear, therefore watch closely for any signs of them.

HARDY FRUITS.—If not already done, no time should now be lost in removing all superfluous shoots of hardy fruit trees of all kinds, whether they are espalier, dwarf, pyramid, or standard trained trees. Not a single shoot that is not wanted should be retained, as there will be no danger of the buds at the base of the shoots breaking into growth after this date. Attend to the tying of the leading shoots on espalier and other trained trees. American blight is still troublesome on some Apple trees, and any that is detected should be destroyed, as recommended in a former Calendar.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aidenham House, Hertfordshire.

PINEAPPLES.—Suckers that were taken from early summer fruiting Pines, potted, plunged, and kept shaded from the sun's rays, should be gradually inured to more exposure as growth becomes perceptible. Provided the potting material was in a suitable condition of moisture and the compost made firm, damping and syringing will serve to provide sufficient moisture, for any excess would quickly cause the soil to become sour. Remove all suckers from successional plants when these are large enough to handle. Continue to ventilate the houses freely during hot weather, as this will cause the plants to produce a sturdy growth. Avoid overcrowding of the plants, and, with a change in the weather, increase the amount of fire heat in order to maintain a temperature of about 70° to 75° at night. Damp the walls and paths well the last thing at night.

LATE VINES.—In order that the vines may be maintained in a good condition throughout the winter, the fruits should be perfectly ripe by the middle of September, sufficient fire heat should be provided to maintain a night temperature of 70° with a circulation of air. Attend to the watering of the roots, and, whilst the berries are colouring, keep the house well damped. Late houses of Muscat Grapes will need the laterals removed to prevent the foliage becoming crowded. Under the present conditions of the weather too much exposure to sunshine will cause the berries to become browned, which detracts from their appearance. At intervals the lateral growths on such varieties as Lady Downes and Black Alicante should be removed before they become too strong, but allow plenty of good foliage to remain over and above the berries to ensure the latter colouring well. Vines of Black Hamburgh which ripened their bunches late should be allowed to make a moderate extension of the laterals, especially those that carried heavy crops of fruit. The bunches in all vineries will keep better, especially in the event of wet weather and a fall in the temperature, if a slight circulation of warmth is permitted in the hot-water pipes at night time.

CHERRIES.—Cherry trees in houses require the coolest conditions that it is possible to give them after the fruit is picked. Where a house is set apart for their culture the roof lights may be removed. Unless the borders are well drained, afford water at this season very sparingly, or the trees will be excited into producing new growths. Damp the bare spaces freely on hot days and syringe the foliage as often as is considered necessary.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CARROTS.—If, owing to the dry season, the stock of Carrots has become short, no time should be lost in sowing, in a pit, some early, stump-rooted variety to be available for use in November. For several years past we have sown Carrots at Frogmore during the month of August to furnish a supply of young roots in November. If a cold pit is employed place the bed to within 18 inches of the glass, and cover it with 6 inches of light, rich soil, made moderately firm. Sow the seeds thinly, cover them with a ½-inch layer of finely-sifted soil, and afford a gentle watering. If the weather continues bright, a slight shading should be given during the warmest part of the day to prevent the soil becoming dry.

TURNIPS.—Another sowing of Turnips may be made now and the crop allowed to remain in the ground during the winter. The plants will probably furnish roots and Turnip greens next spring. Turnips sown a month ago should be given frequent waterings of clear water in the evenings, and the soil between the rows stirred with the Dutch hoe. If the Turnip fly is troublesome, dust the foliage well with wood ashes either after each watering, or in the early morning whilst the foliage is damp with dew.

BATAVIAN ENDIVE.—A batch of Batavian Endive should be planted now for supplying leaves during October and November. Any part of the garden will be suitable for this

plantation, but the latest batch for outside cultivation should be planted on a well raised border facing south, where some protection may be afforded during times of frost or heavy rains. A sowing of this vegetable may be made at the present time to provide plants for growing in cold frames, into which they should be transplanted as soon as they are large enough to handle. If this system is adopted the plants will become established before the autumn is far advanced. The lights should be left off until the approach of frost, when they should be placed over the plants at night time, but removed again during the early part of the day. As soon as the earliest plants have attained to their full size, some of them, when perfectly dry and cool, may have the leaves tied together, so that they may become blanched as soon as possible.

CORN SALAD.—A sowing of this useful salad plant may now be made to furnish plants for use during the autumn. Sow the seeds thinly in shallow drills and give liberal supplies of water to ensure a quick growth. When the plants are large enough they may be thinned to 6 inches apart. Hoe the ground frequently and never allow the plants to suffer from want of water.

CHICORY.—The latest batch of Chicory should be ready for thinning, which should be done as soon as the plants are large enough for the operation. Allow a distance of 6 inches between the plants, so that they may make fine specimens.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

BULB PLANTING.—The present is a suitable time for the planting of the majority of early-flowering bulbs, including Muscari (Grape Hyacinths), Crocuses, Fritillarias (Crown Imperials), and Narcissi. Tulips, Dutch Hyacinths, and English and Spanish Irises should not be planted until late in the autumn. The beautiful autumn-flowering *Crocus speciosus* should be planted without delay, and should further variety be desired, *C. zonatus* (lavender), and *C. longifolius* (purple-violet) may be selected. Nor should any time be lost in the planting of *Colchicum autumnale*, *C. speciosum*, and its variety album and *C. Bornmülleri*. Autumn-flowering Cyclamens are either flowering or about to flower, and the ground about the tubers should be cleansed of weeds and a very light covering of sifted leaf-soil or peat laid neatly in the spaces unoccupied by the plants. The present time is suitable for lifting and replanting bulbs of *Lilium candidum*, which seems to succeed best in a strong loam. The plants are very effective when massed near the front of a mixed border.

ANTIRRHINUM.—The season, so far, has been very unsuitable for Antirrhinums, and recently it has been necessary to remove, every second or third day, the flower-spikes that have gone prematurely to seed. But, by adopting this practice, and affording plenty of manure water, the plants will be assisted in producing fresh spikes of flowers. A choice selection of these flowers is exceedingly beautiful, and, besides the older Pink, Carmine Pink, and Queen of Yellows varieties, Sutton's Apricot has proved a great acquisition. The ordinary tall-growing Apricot variety, though a different shade to Sutton's Apricot, is also a striking variety, and Old Rose, which is much like Cottage Maid, is another desirable sort.

MONTBRETIA.—The varieties of Montbretia are, at the time of writing, well in flower. Though they are not exhibiting such distressing symptoms of heat exhaustion as many other flowers, it is essential to provide plenty of moisture at the roots as they will quickly set seeds if the soil is dry. At Tynninghame we employ many thousands of Montbretias in borders furnished with yellow-flowering plants; all the sorts, whether sulphur, yellow, or red-flowered, harmonize well with other plants and produce a striking and pleasing effect. It would be a mistake to entirely supersede some of the older varieties with the newer, large-flowered sorts, such as Lord Nelson, Lady Hamilton, and Hereward, because some of the former are very effective, as, for instance, *M. Pottsii grandiflora*, one of the

very smallest flowered of the race. The variety Vulcan, which is midway between the old and the new types, is also a good decorative plant. Associated with these is *Antholyza paniculata*, which is not yet showing flower; its backwardness in a season when many subjects are flowering prematurely is a decided advantage.

ACONITUM.—The common *A. Napellus*, and its varieties pyramidale and others are over, but clumps of *A. autumnale* and its variety album are still in bloom, the species being one of the finest blue-flowered plants now expanded. This will be succeeded by *A. Wilsonii* and still later by *A. japonicum*. All these are easily raised from seeds but once a stock has been obtained it is better to lift the plants annually and, if required to be massed, to select the strongest roots and dibble them into the ground at 9 inches apart. A clump of *A. autumnale*—associated with *Phlox paniculata alba* furnishes a very pleasing combination.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

SUMMER CROPS.—The bulk of the Melon crop is now practically over, the plants having grown and fruited continuously without a check. The demand for Melons has been good and the prices more remunerative than they were in the two previous seasons. The batch of Melons planted in June must not be neglected; the plants should receive an abundance of moisture during the hot weather. Cucumbers are developing many unnecessary shoots to the detriment of the young fruits; all superfluous growths should therefore be removed on at least two occasions weekly. Tomato plants are in full bearing. The fruits should be gathered as soon as possible; if necessary their ripening may be finished in a shed. The leaves may be thinned severely to the benefit of the younger trusses.

AUTUMN CROPS.—Crops of Celery, Carrots, and Cauliflowers planted either on the old manure beds or in the open ground will require systematic waterings from now till late September. If these plants are attended to carefully a good return may be expected when they are marketed, as the drought has greatly impeded the growth of all vegetables in the open fields. The Beans sown in July must not be allowed to suffer from dryness at the roots. The ground should be stirred at least once every fortnight by the hoe. Where frames are at liberty from the Melon crop, they may be placed over the Beans whilst the plants are still small.

SPRING CROPS.—Seeds for the main batch of Cabbages should now be sown thinly in frames. This sowing will probably have to provide all the plants needed for this crop, as those raised earlier are growing too vigorously and many of them may "bolt." The seedlings of these earlier sowings are ready for pricking out 3 inches apart in a nursery bed; an old manure bed is generally chosen for this purpose. Transplanting not only promotes the growth of the rootlets, but it greatly facilitates the elimination of the "bolters." The last sowing of Onions should now be made broadcast in well prepared ground. The seeds should be covered with a good layer of decayed manure. In this district, where there is a large demand for this vegetable, we make another sowing of Onions early in September in a sheltered position.

GENERAL WORK.—The programme of next season's work should now be drawn up, so that the ground may be allotted for each crop as early as possible. A place must be reserved for the stacking of the decayed manure from the old manure beds and the Melon trenches. Some of these materials may be carted away to be broken up and used for the seedbeds and ground in which the crops of Lettuces, Cauliflowers, and other crops will be transplanted. The present is the best time to undertake any improvement or alteration to the ground, including draining and levelling. The washing of the cloches should also be commenced as soon as possible; when cleansed they should be rinsed in a strong solution of copper sulphate. The lights also need to be cleansed and painted before they are stored for the winter. The present is the proper time to buy new mats for garden use.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 22—

Roy. Hort. Soc. of Ireland Fl. Sh.

WEDNESDAY, AUGUST 23—

Shropshire Hort. Soc. Sh. at Shrewsbury (2 days).

THURSDAY, AUGUST 24—

Peebleshire Hort. Soc. Fl. Sh.

SATURDAY, AUGUST 26—

Symington Fl. Sh. Hawick Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—61°0'.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 16 (6 P.M.): Max. 77°; Min. 54°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 17 (10 A.M.): Bar. 30.3°; Temp. 70°; Weather—Sunshine.

PROVINCES.—Wednesday, August 16: Max 74° Cambridge; Min. 58° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY—

Trade Sale of Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

WEDNESDAY—

Trade Sale of Dutch Bulbs at 67 & 63, Cheapside, E.C., by Protheroe & Morris, at 10.

THURSDAY—

Trade Sale of Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

been held, and the porters have decided to form a branch of the Gas Workers' and General Labourers' Union. A certain amount of goods was introduced into the market by ingenious expedients and devices. Motors were used by a certain number of growers, many of whom themselves brought their produce to the market. Occasional furniture vans, seemingly innocent of vegetables, escaped the vigilance of the pickets, and, arrived at the market, opened their doors and discharged their unusual freight. Now and again a van loaded with vegetables made its appearance in the market under the strange escort of a posse of police. It is certain that the goods coming from abroad, France in particular, suffered most; large quantities of Greengages and Pears, known to be in transit failed to reach their destination. Not a little loss was avoided by the London agencies of Spanish shippers advising the latter by cable to postpone shipments indefinitely, or to send moderate supplies only of Melons, Onions and Valencia Tomatos. Market produce carried by rail suffered very erratically. That carried by the Great Western and South Eastern was delayed most, and that carried by the North Western least. The increased price of vegetables in London and in country districts is to be attributed by no means entirely to the strike: the abnormal heat and drought have curtailed the supply most seriously, and even though there had been no strike, prices would undoubtedly have risen. It is stated that importers of Bananas have suffered severe losses, the amount estimated in some cases at something like £12,000. We learn that the total loss of Bananas is from 70,000 to 80,000 bunches, and in illustration of the fact that "It is an ill wind that blows nobody any good," Lemons have advanced by 10s. a case. The boat "Runic," laden with Tasmanian Apples, has been unable to unload its cargo, and the "Minnehaha," which has a load of Californian Pears and Plums outside the docks, is now being unloaded. It is deplorable to think that these losses will in many cases fall upon the growers and agents, and that it may bring ruin to many a small man. One consolation to those engaged in the fruit and vegetable trade in Covent Garden lies in the fact that the strike occurred during Bank Holiday week, when the work in the market is less than at other times. There is reason to fear that far greater disorganisation and loss have occurred in other centres, such as the Borough Market, through which large quantities of perishable vegetables and fruit stuffs pass.

OUR SUPPLEMENTARY ILLUSTRATION.—The supplementary illustration shows the beautiful *Incarvillea lutea* growing wild in China, as photographed by Mr. GEORGE FORREST, whilst plant collecting on behalf of Messrs. BEES LTD. In a note on this plant Mr. FORREST writes:—Of the countless and beautiful Alpines which inhabit the mountains of N.W. Yunnan, few stand out more prominently than *Incarvillea lutea*. It is one of the many beautiful species

comprising the first collections of Abbé DELAVAY, and was found by him in 1889 on the mountains surrounding the sources of the Lang-kong river. Though possibly in later years it may be rediscovered in many parts of the province, so far it is only known from one other habitat, the southern end of the Lichiang Range. The species varies in height according to the situation, from 2 feet to 4 feet. The leaves, which are pinnate, are mostly radical; they vary from 8 inches to 15 inches in length, and have long petioles. The segments, broadly lanceolate with crenate margins, have the upper surface deeply reticulate, dark-green and glossy, whilst the under side is much lighter and sparingly hirsute. The scapes, which are stout and rigid, carry a few leafy bracts of the same form. The flowers are borne in loose spikes of 6 to 20 blooms, on short, stout pedicels, and are slightly pendulous; the tube is of a deep shade of yellow with a suspicion of apricot, but the limb is a pure, pale yellow. The calyx is campanulate, about $\frac{1}{2}$ inch by $\frac{1}{4}$ inch, strongly ribbed, the divisions short, lanceolate, acuminate. The corolla tube is from 2 inches to 3 inches in length, tapering from $\frac{1}{4}$ inch at the base to $\frac{1}{2}$ inch at the apex; the limb is fully 2 inches in breadth, and the segment broadly ovoid or rotund. The mature capsules are erect, 2 inches to 3 inches long by $\frac{1}{2}$ inch broad. The season of flowering is June and July. *Incarvillea lutea* is a strikingly-handsome species, and should prove a rich addition to gardens. The dark, graceful foliage and richly-coloured flowers show up well in the natural habitats, which are either amongst dwarf scrub on steep, stony slopes, or scrub-covered ledges of limestone cliffs, at altitudes varying from 10,000 feet to 12,000 feet. The plants flower most freely, numbers of the specimens seen bore as many as four to eight scapes. The Supplementary Illustration shows a good average specimen in full bloom. The species ripens a great number of seeds, but it is not by any means common; only in a very few situations were the plants really numerous. The plant is a biennial, in the sense that, immediately the function of seed-bearing is at an end it dies, but a plant often takes from three to five years to reach the flowering stage. This seems to hold good in cultivation, as plants grown from seed which was sown in the spring of 1907, though now of large size and in every respect healthy, have not yet flowered. In its natural habitat the species favours dry, rather than moist, shady situations, with a free, light soil containing a large proportion of limestone chips.

MR. E. H. WILSON.—After a visit extending over three months to this country, Mr. E. H. WILSON sailed for Boston, U.S.A., on Tuesday last by the steamship "Zeeland." He is returning to America for the purpose of examining, on behalf of the Harvard University, the specimens collected by him during his last two explorations in China. The herbaria number roughly about 50,000 specimens, including some 3,000 species. Coniferae, collected at high elevations on the Chinese Tibetan frontier, form a considerable part of the collection.

FLOWERS IN SEASON.—Flowers of a pretty Iris, the petals being a delicate shade of mauve, are sent by Mr. AMOS PERRY, Enfield, with the following note: "I am sending you a few flowers of Iris Mrs. Alan Gray, a pretty hybrid raised by the late Sir MICHAEL FOSTER, which has the unique character of flowering at intervals throughout the season. I exhibited flowers of this Iris at the R.H.S. show at Westminster last September; this year it has been flowering since the last week in May."

The Dock Strike and Covent Garden.

The general effect of the dock strike, which, in spite of the statements made a few days ago, is unhappily not yet at an end, have been described graphically and in detail by the picturesque writers of the daily Press. With these general effects, we do not propose to deal, not because they do not claim the attention of all thinking people, but because they involve political and economical considerations which lie outside our immediate work. So far as the market in Covent Garden is concerned, we have reason to know that the effects of the strike have been greatly exaggerated in many quarters. Much of the horticultural produce which, during the period of the strike, was excluded from this market consisted of choice fruits and expensive vegetables, that is to say, of luxuries rather than of necessities. Nevertheless, it is admitted that great difficulty was experienced in getting goods in and out of the market. This was due in part, of course, to the disorganisation at the docks, but also to the sympathetic feeling for the strikers manifested by the workers in Covent Garden. This sympathy was not without effect. At the time of the outbreak of the strike the porters were not associated with any union, but during the last few days meetings have

INCARVILLEA LUTEA, GROWING WILD IN CHINA.

NATIONAL VEGETABLE SOCIETY'S EXHIBITION.—Owing to the exceptional weather the conditions in Messrs. W. CUTBUSH & SON'S class for 25 dishes have been altered. Any kinds or varieties may be shown, provided the seeds were obtained originally from Messrs. CUTBUSH.

SMALL-HOLDERS' SHOW AT THE CRYSTAL PALACE.—An exhibition of fruit, vegetable, and general garden produce will be held at the Small Holdings and Country Life Section of the Festival of Empire, Crystal Palace, on the 29th, 30th, and 31st inst. A championship Silver Cup is offered to the competitor who secures the greatest number of points, and the "runner-up" will receive a Gold Medal. Upwards of 100 prizes, including £50 in money and many Silver Medals, are offered in the 80 classes. A keen competition is expected in the class for a collection of vegetables open to small holding and allotment societies in the United Kingdom. In order to make the exhibition a complete reflex of rural activities, prizes are offered for small-holders' produce packed for market, table poultry, eggs, butter, &c., and also for various specimens of country handicraft contributed by the small-holders' wives and children. Full details of the show and schedules may be had on application to the organising secretary of the show at the Crystal Palace.

GEORGE F. MCCLURE.—We learn from the *American Florist* that Mr. GEORGE EDWARD MCCLURE is the president-elect of the Buffalo Florists' Club. He was born in Scotland, having emigrated to the United States with his parents at the age of ten years. The son of an all-round florist and landscape gardener, he naturally inclined towards his father's occupation, and at the age of 17 he was in charge of the Orchid and propagating houses of the firm of WILLIAM SCOTT, of Buffalo, and at 19 had charge of the large collection of Orchids and Chrysanthemums at the establishment of KATE B. LEWIS, in the same city.

THE YIELD OF A SMALL MIXED ORCHARD.—Interesting statistics concerning the yield of a Cherry orchard in Kent, compiled by Mr. C. H. HOOPER, are published in the *Journal of the Board of Agriculture* for July. The records and prices extend over a period of 29 years, from 1882 to 1910, and relate to a grass orchard chiefly planted with Cherries at Sheldwich, near Faversham, Kent. From this orchard are sent some of the best Cherries that enter Covent Garden, and they are, in addition, carefully sorted and packed. In the opinion of the owner, the prices received represent the average prices obtained for good quality fruit from this district. The area of the orchard is $4\frac{1}{2}$ acres on loam over clay over chalk. The trees, which were mostly mature at starting, consist of 97 Cherries, 61 Apples, 27 Pears, 96 Plums, 2 Quinces, 2 Walnuts, altogether 285 trees, or 67 trees per acre. In the hedges surrounding the orchard there are about 50 Damson trees. The total net return from salesmen in Covent Garden in 29 years is £1,762 6s. 5d., an average of £60 15s. 5d. per annum, or £14 6s. per acre. The owner says that, in addition, the value of fruit consumed by his household has been about £7 yearly, and he has received about £3 yearly for the grazing of the orchard by sheep. **Cherries:** The 97 Cherry trees (several of which have been re-grafted during the period with the best market varieties) have yielded $6,287\frac{1}{2}$ half-bushels of 24 lbs., selling for £1,584 6s. 5d., the average annual yield thus being 217 half-bushels, realising £54 12s. 8d., or 11s. 3d. per tree. The yield has varied from 18 half-bushels, selling for

£5 8s. 6d. in 1910, to 553 half-bushels, selling for £112 8s. 3d. in 1901. The price has varied from 2s. 6½d. per half (1½d. per lb.) in 1909 to 8s. 6d. per half (4¼d. per lb.) in 1897, the average price for the period being 4s. 10d. per half, or 2½d. per lb. **Apples:** The 61 Apple trees have yielded, in 24 years, 2,133 half-bushels, selling for £211 17s. 6d., an average of 89 halves, or £8 16s. 6d. per annum, or nearly 3s. per tree per annum. As in the case of Cherries, the variation in yield is very great. For instance, in 1885, the yield was insignificant (only 3 half-bushels), while in 1902 it was 273 halves, selling for £36 7s. 6d. The price per half-bushel varied from 1s. 6d. in 1891 to 3s. 6d. in 1890. The average price per half-bushel for the 24 years is 1s. 11½d. **Pears:** The 29 Pear trees in 22 years yielded 1,009 halves, selling for £93 12s. 3d., an average per tree of 3s. yearly. The maximum yield was 230 halves, selling for £18 5s. in 1909. The price varied from 1s. 6d. per half-bushel in 1893 to 2s. 11d. in 1889; average price for the 22 years, 1s. 10d. per half-bushel. **Plums:** The 96 Plum trees yielded in 12 years 436 halves, value £47 12s., an average of 36 halves per annum, selling for 79s. 4d. The maximum crop was 137 halves in 1908, selling for £10 9s. 6d. The price varied from 1s. 1¼d. per half in 1909 to 3s. 4d. in 1884, the average for the 12 years being 2s. 2d. The two Walnut trees in 29 years yielded 659 half-bushels, selling for £66 10s. 6d., average of nearly 23 halves per annum, selling for £2 5s. 9d. The largest yield was 48 halves, which fetched £5 4s. 6d. in 1897. The price varied from 1s. 1¼d. per half in 1909 to 3s. 4d. in 1884, the average price for the 29 years being 2s. per half-bushel.

THE SPECIES OF PELARGONIUM.—Dr. KNUTH has published* a new sketch of the distribution of the species of Pelargonium, with observations on their morphological peculiarities. The total number of species known is approximately 250, of which all except four are found in Africa. The exceptions are *P. Endlicherianum*, a native of Asia Minor, and *P. Rodneyanum*, *P. australe*, and *P. anceps*, Australian species. The two last are very closely allied to South African species, whilst the other two are distinct. *P. australe* is widely spread in Australia and New Zealand, and it also occurs in Tristan d'Acunha. Mr. CHEESEMAM suggests that "it is probably identical with the South African *P. grossularioides*," and BENTHAM, in the *Flora Australiensis* discusses the close affinities of the forms under these names. It is a curious fact that *P. grossularioides* is colonised in California, and it also occurs in the Neilgherries, where KNUTH considers it may probably be indigenous. Dr. KNUTH seems to have overlooked the singular *P. cotyledonis*, endemic in St. Helena, and figured under *Geranium* in Andrews's *Geraniaceae*, and as *Isopetalum cotyledonis* in Sweet's *Geraniaceae*, t. 126. The greatest concentration of species of Pelargonium is in the south-west district of the Cape Province, where there are 110. On the west side two species only reach the Portuguese Congo, whereas five occur in Abyssinia. Pelargonium exhibits perhaps as great a variety in vegetative character as any genus of herbs and undershrubs. Very few are annuals, but the leaves of the perennials exhibit a very wide range of form. In some species the blade disarticulates from the stalk, which lignifies into a permanent sharp-pointed spine, serving as a protection to the plant. With regard to the root, Dr. KNUTH states that development is moderate as compared with the Monsonias of the desert, which often penetrate the soil to a depth of many metres.

* Bericht ueber die achte Zusammenkunft der freien Vereinigung, etc., 1910.

DYNAMITE USED IN TILLING LAND.—According to the *Pastoralists' Review*, dynamite has been used in the place of the plough for the tilling of clay land in Kansas. Experiments were conducted on an acre field, holes being made by crowbars to a depth of 4 feet, in rows 3 feet apart, and cartridges of dynamite were inserted, these being exploded by a line of men provided with red-hot irons. The explosions threw clouds of soil 30 feet into the air, and covered the men from head to foot with dust and dirt. The method is recommended for clay soils that have not been previously disturbed.

A NEW LAWN GRASS.—For some time past experiments have been made in New South Wales with a grass, locally known as Blue Couch, for bowling greens, croquet lawns, &c. The reports collected by Mr. MAIDEN, and published in *The Agricultural Gazette of New South Wales* are very favourable to its use under certain conditions, though ordinary Couch, *Triticum repens*, is preferred for fine lawns in Sydney. Questions have arisen as to the correct name and origin of this grass, and Dr. STAFF (*Kew Bulletin*, 1911, pp. 256-261) gives full particulars on these points. *Digitaria didactyla* is the name this grass should bear, if *Digitaria* be separated generically from *Panicum*; and *Panicum didactylum*, *P. gracile* and *P. subtile* are given as synonyms. The affinity of the grass, Dr. STAFF states, lies evidently with *D. sanguinalis*, from which it differs in its perennial duration and peculiar mode of growth, the fine blades, the small number of racemes and their slender build. *Digitaria didactyla* is a native of the Mascarenes, of Madagascar, and also of the littoral of New South Wales.

EXPERIMENTS ON THE FORCING OF PLANTS.—Everyone is aware of the methods of etherisation and immersion in warm water by which plants may be caused to pass from their resting-stage and to flower precociously. Recent experiments by Dr. FR. JESENKO* demonstrate that yet another method may be employed for this purpose. The new method, which would not at first sight appear to be so practicable as the older methods, consists in injecting into the stems watery solutions of alcohol or of ether. The process is simple. The injection fluid is contained in a vessel, and is subjected to a pressure of one to three atmospheres. Side tubes connect the vessel with the branches to be forced. Using Ribinic *Pseudacacia*, Dr. JESENKO was able to show that a 5 per cent. solution of alcohol or a 0.1 per cent. ether solution injected into cut branches caused the buds thereof to expand 26 days earlier than was the case with the buds of untreated branches. It may be noted that it is not necessary to cut off the branch which is to be forced. By attaching the cut end of a branch which remains attached to the shrub or tree to the injection-apparatus, the solution may be forced into the plant and precocity of flowering induced. By the use of a morphia syringe Dr. JESENKO injected single buds with alcohol and ether solutions, and succeeded in causing the parts so treated to expand before the untreated buds. Herein is conveyed a hint which the more enterprising vine growers might avail themselves of, though as to whether the results would be successful we expressly guard ourselves from venturing an opinion. It should be added that another experimenter, Dr. WEBER, has also made independent use of the method of injection, using for the purpose the morphia syringe. Pure water is injected into the buds of Lilac, and the plants brought into the forcing house, the injected buds swell and expand long before the untreated buds.

* Berichte der Deutschen Bot. Gesell., xxix., 5. 1911.

PLANT ALKALOIDS.—On account of their economic and medicinal value, alkaloids have always possessed especial interest amongst plant constituents, and the chemist has paid the very closest attention to their investigation. His efforts have been two-fold, to establish the constitution of the alkaloid and to effect its synthesis in the laboratory from simple substances. Suggestions have then been based on such researches as to the possible method by which the alkaloids have been formed in the living plant. A few years back PICTET pointed out that the vegetable alkaloids could all be regarded as degradation products of the vegetable proteins, which are nitrogenous substances of great complexity. The proteins break down in the plant into simpler substances, the nature of which has been very fully studied during the last few years; these simple units are united again with formaldehyde, which, there is strong ground for believing, is continually being formed in the leaves. The new compounds so formed undergo a series of further minor changes, of such character as are well known to take place in the plant, until finally alkaloids are obtained. This explanation was shown to apply in the case of alkaloids belonging to most of the main groups, with the exception of the so-called isoquinoline alkaloids, a group which includes such important representatives as morphine and the other opium alkaloids, berberine, &c. Professor PICTET has now succeeded in filling the gap and extending his explanation to this class of alkaloids by showing that when such well-known degradation products of plant proteins as tyrosine and phenylalanine are brought together with formaldehyde they readily condense to isoquinoline derivatives, which by a series of simple changes are convertible into isoquinoline alkaloids. There are thus strong reasons for regarding all alkaloids as being built up in the plant from the degradation products of proteins and formaldehyde.

THE PRIMULAS OF THE EUROPEAN ALPS.

(Continued from p. 45.)

HYBRIDS.

So much obscurity still reigns in gardens and catalogues as to the names and characteristics of the many natural hybrids occurring between the various sub-sections of the section Auricula that it is full time the question was exhaustively dealt with. Unfortunately, however, the system of classification seems hardly satisfactory as yet, and much work still remains to be done. It will have to be done, though, by field botanists and gardeners, even more than by herbarium study, for the collation of dried specimens leads to an excessive rigidity and aridness of definition quite out of place in dealing with such large and diverse families as arise from the crossing of one *Primula* with another. These crosses need to be studied closely on the spot, and in gardens, in the living state, before any classification of their several characteristics can be really satisfactory. Further, we are suffering from a too minute differentiation, and from a multiplicity of unnecessary names. At present it is possible for any collector to differentiate some form of a well-known hybrid, and then to impose it on the world under a special name.

In point of fact, I would suggest that the profuse naming of hybrids and their division into separate varieties is altogether a mistake, seeing that all the named forms shade into each other invariably by an unbroken chain of intermediates. At present, for instance, the glutinosa \times minima hybrid (and its reverse) is ranged under four names—*P. Huteri*, *P. biflora*, *P. Floerkeana*, and *P. saliburgensis*. But of these four, not one is distinct, as a species is distinct. *Huteri* and *saliburgensis* are both unfixed forms of glutinosa \times minima; the other two are forms, no more settled, of minima \times glutinosa. In either cross one could easily discover and name yet other developments, if one

chose to add confusion to confusion. For when one *Primula* produces seed after fertilisation by pollen from another, there results a large family of offspring, each liable to be as different from its brother as any members of a human family. All preserve varying degrees of intermediateness between their parents: in all, the influence of the mother remains, it seems to me, so dominant that one can always tell which way the cross has been effected, by the hybrid's approximation to its seed-parent's habit. Thus, minima \times glutinosa will always show the larger flowers of minima, even if the stalk be taller; while glutinosa \times minima will verge towards the smaller blooms and darker colouring of glutinosa. But, with that limitation, the range of varieties is so great in any single cross that a hard-and-fast delimitation of named varieties becomes impossible after study of them in the open field.

What one would like to suggest, then, would be some scheme by which every cross should be covered by one single name, and this, in turn, be marked off with numerical distinctions, to indicate differing degrees of likeness to their respective parents. As thus: let us take *P. saliburgensis* as the generic name of all hybrids between glutinosa \times minima. But, as *P. saliburgensis* varies towards minima on the one hand, and glutinosa on the other, so freely as to offer one the chance of naming many of these developments after one's friends and relations, let us, instead, postulate a scale, with minima at one end and glutinosa at the other. This should consist of three or five hypothetical degrees, indicating the nearness of the different forms to minima, their mother. Thus:

<i>P. saliburgensis</i>		
	\times	
1	2	3
<i>P. minima</i>		<i>P. glutinosa</i>

Then, *P. saliburgensis* 1 would indicate all those hybrids nearest to minima which are at present quite unsatisfactorily covered by the name *P. biflora*; *saliburgensis* 2 would mean the next range, almost exactly intermediate, with taller stems and large flowers (at present fixed to *P. Floerkeana*); while *saliburgensis* 3 would indicate the uttermost resemblance to *P. glutinosa* which the seed of *P. minima* is capable. Thus one would at least avoid the perils of a too academic definition, numbers being more elastic than specific names, and might, by some such system, escape the unsatisfactory, hard descriptions that now prevail. The system, at present, is at once too stern and too lax. A hybrid *must* answer to a detailed portrait: any variation from this ideal may receive a separate name. *P. Kellereri* is a variety of the magnificent *hirsuta* \times minima cross (other named forms are *Steinii* and *Forsteri*); but with, and as, *Kellereri* I already have yet another development, much closer to *hirsuta*, paler, laxer, and less brilliant. But this wholly different form must rank still as *Kellereri*, though, at the same time, capable of being promoted into *Primula Bullock-Workmanniae*, or some such name, at the pleasure of any collector who may happen along and describe it. Whereas, if a more elastic system ruled, all minima \times *hirsuta* crosses would come under, say, *P. Forsteri*, and the present possible *P. Bullock-Workmanniae* would simply be *P. Forsteri* 3, as approximating most closely to *P. hirsuta* at the lower end of the scale. Even in so rare a hybrid as *P. Jurbella*, only known, so far as I am aware, on the Giurbella Alp, one is able to pick out three or four differing developments, wavering more or less towards *P. minima* or *P. tyrolensis*. In common crosses, then, such as minima \times glutinosa, it may be imagined what a bewildering possibility of names exists.

In taking my readers, accordingly, through the named hybrids, it must definitely be understood that these names imply no sort of hard-and-fast line between the plants they cover. The names, so far, are merely a very poor "pis

aller." In the subsection *Eu-Auricula*, the names are simply, as we shall see, a cry of abject despair on the part of the learned. None the less, so beautiful are many of the crosses, so common in gardens and so confused in catalogues, that the study of the titles that try to represent them is well worthy the pains of all who want to cultivate them and know what they are. *Reginald Farrer.*

(To be continued.)

MORE NOTES FROM NEW ZEALAND.

SINCE my first communication on New Zealand plants, I have received another letter from my correspondent, of which I quote parts.

"Several of our native *Celmisias* have already borne their handsome Daisies; but more are to follow, for the splendid *holosericea* and the poorer-flowered *rakiura* are thrusting up innumerable flower-buds. The last-named is one from Stewart Island, and is said to be a form of *C. Traversii*, though Cheeseman does not give *rakiura* as a variety, or even give that name at all. Still, I have tried to grow *Traversii*, and failed; but have found *rakiura* very easily grown, and though I have had it for very many years, it has not died suddenly, as is common with many species. *C. verbascifolia* is very prone to behave in that way. The plant will seem quite healthy and flower well, when, for no apparent reason, it will die. This is to be regretted, as its large, long-rayed flowers are a joy. Those of *rakiura* have but short floret rays, and this detracts from their beauty; but the foliage is striking and handsome. The leaves are of a dark green, thickly clothed with a brownish tomentum on the underside. Another native denizen of the rock-garden beginning to flower is *Ourisia macrophylla*. Like the *Celmisia*, it is a mountain flower. Of the several species *O. macrocarpa* and *O. macrophylla* are very much alike in flower. The flower-stem of *O. macrophylla* rises to about a foot in height, and bears whorls of white flowers, which grow after the manner and are about the size of those of *Primula japonica*. They are not, however, so symmetrical, as the petals are larger on one side than on the other. Both species of *Ourisia* require a fair amount of moisture, and, indeed, the same situation that would suit the Japanese Primrose would prove suitable for them. Recently, *O. macrophylla* has been introduced into England, where it has been received with acclamation, and has figured in some of the gardening publications. It is, indeed, a charming plant a creeping species, *O. cæspitosa*, which has no lofty stem, but bears each little flower on a short stalk in a wet season, will make a mat in an ordinary border; but, in dry summers, such as we have recently experienced, it disappears altogether. This is not to be wondered at, as its natural habitat is amongst the rocks and stones fringing the mountain torrents, where it receives abundant moisture. Such a mat, covered with white blossoms, suggestive of white Violets, is pretty; but it is not so showy as the other species named.

"I promised to write of our native trees and shrubs. Of trees for growing in a garden large enough to admit specimens of any size, the palm must be given to the native Beeches or Birches, as they are usually called, and of these the finest is what is known in Otago as the Red Birch, for the popular nomenclature varies in different parts of the Dominion. For example, our Red Birch (*Fagus fusca*) is the Black Birch of Nelson. Of the Birches, the handsomest is the Red Birch, and it, as well as other species, grows rapidly for a New Zealand tree. One in this garden, which I brought from its native forest as a tiny specimen, about 6 inches high, is now a lofty tree, with a bole measuring 47 inches in circumference at about a foot from the ground. It is, I think, one of the most beautiful of our native trees. A forest

of Red Birches, where the massive trunks uphold a roof of the lightest green, through which permeates a softened light, presents a scene of rare sylvan loveliness. Then, in the springtime of the year, how beautiful are these trees! Autumn does not sear their leaves, but the old leaves fall in spring, and, before doing so, assume the bright reds and golds of autumn. Once I visited the Rees Valley, at the head of Lake Wakatipu, at the time of the change of leafage, and was rewarded by a glorious sight. On many of the Birches the old leaves had turned a bright red, on others they had assumed a golden hue, and the young sprays, clothed with leaves of a bright yet delicate green, stood out from amidst the brighter colours. It formed a sight to linger in the memory. The garden contains well-grown specimens of Birches, such as *Fagus Solandri*, *Menziesii*, and *Blairi*, all of which are beautiful, but none equal to *fusca*. Very satisfactory trees to grow are the Ribbonwoods, especially those known as *Hoheria populnea* and *Plagianthus* (now *Gaya*) *Lyallii*. Of the former, the variety known as *angustifolia* has proved the best with me, and flowers freely every autumn. The other form, which is the handsomer tree, is, for some unknown reason, a shy flowerer. Botanically, the trees may be the same, but the leaves are totally different, as well as the time of flowering, for the narrow-leaved variety flowers much earlier, and its flowers, though more numerous, are smaller. The *Gaya*, commonly called the Cherry-flowered Ribbonwood, is deservedly popular, as it is the most beautiful of our flowering trees, not even excepting the *Rata*, or *Ironwood*. Of course, the latter is the more conspicuous, and its blaze of crimson-scarlet brightens up many a coastal bush to the south. Our flowering shrubs are numerous, and such of them as are hardy enough to stand the English climate are prized there. *Olearia Haastii*, with its tiny flowers and dull foliage, I consider one of the least desirable of our Daisy-flowered shrubs; yet, in a recent volume of the *Journal of the Royal Horticultural Society*, I find, in an article entitled 'Some Beautiful Shrubs,' the following passage: 'Generally speaking, the *Olearias* cannot be recommended for other than sheltered gardens, as they come from Australia and New Zealand; but one which should be included on account of its hardiness is *O. Haastii*. This makes an excellent subject for grouping, and is grateful alike to the eye when in flower and when carrying its profusion of feathery seeds.' If the author, who is a V.M.H., can write so enthusiastically of this *Olearia*, which I consider a poor thing, what would he say to *Olearia nitida*, which grows wild on our Town Belt? When in flower, it is pleasing, for its many bunches of Daisy flowers emit a delightful perfume. Our *Olearias* are all worthy of a place in the garden, but my favourite is *nitida*. The grey foliage of *O. laxiflora* is attractive to the eye amongst the greens of other shrubs. The Japanese Maple is suitable for a small garden. Here is one of the green-leaved variety, which is fully 20 years old, and has been a joy at all seasons ever since it was planted, but more especially so in spring and autumn, when the tender green or bright-red leaves adorn its graceful sprays. Is it not a picture now, with its outer leaves brightly glowing at the tips of the branches, whilst the hue gradually merges into the lingering green of the more-sheltered leaves? Presently the whole tree will be ablaze, though a few of the leaves on the outer branches will have fallen. No wonder the Japanese are almost as proud of their Maple leaves as of their Cherry blossom. This little shrub, with leaves of the brightest red, is one that always gives a splash of colour in the autumn; but it is a very, very slow grower. It has been there many years, but is only about a couple of feet high. Its name is *Enkianthus japonicus*. It is worth having, and might grow better under more suitable conditions, but would never be a large or strong-

growing shrub. A beautiful shrub is the Tasmanian Laurel (*Anopterus glandulosus*), and it is surprising that it is not better known, since it is a native of such a near neighbour as Tasmania. It is a shapely shrub, of upright habit, with dark green leaves, and each branch is crowned with sprays of flowers resembling those of the Lily of the Valley, but with larger bells, which are sometimes slightly tinged with pink. It is an exceedingly beautiful shrub, which should be in every garden which can furnish a comparatively shady corner, for it does not love the full sun."

Gaya Lyallii (syn. *Plagianthus Lyallii*) received from this correspondent as a little plant, about 6 inches high, some years ago, is now over 10 feet in height, and flowers profusely every year. *Hoheria populnea* is grown in the south-west, and has bloomed, and there are several specimens of *Anopterus glandulosa* in Devon and Cornwall, and in the Isles of Scilly, in Mr. Dorrien-Smith's garden, there is an enormous shrub about 12 feet in height, that flowers magnificently. *Wyndham Fitzherbert*.

"COUCH" OR "TWITCH."*

THE terms "Couch," "Twitch," "Scutch," "Squitch," "Whickens," and "Quack Grass" are often applied by farmers in a general sense to several perennial weed Grasses which creep on or below the surface of the soil.

Three species of Grass are commonly known by the name "Couch":—

(1) True "Couch" or "Twitch" (*Agropyrum repens*, Beauv.; *Triticum repens*, L.).

(2) Black "Twitch" or Common Bent Grass (*Agrostis vulgaris*, With.).

(3) Onion "Couch" (*Arrhenatherum avenaceum*, Beauv. var. *bulbosum*, Lindl.).

These are amongst the most troublesome of all weeds of arable land, and when they are once established a great deal of expense must be incurred before the land is again clean enough for the successful growth of crops.

(1) TRUE "COUCH" OR "TWITCH."

Common Couch Grass (*Triticum repens*, L.) is one of the most commonly distributed of European Grasses, and grows on a great variety of soils. It is rarely present in pastures and meadows, but is found in almost all hedgerows and upon banks separating or bordering arable fields, and rapidly spreads from these situations over the cultivated land unless steps are taken to check it.

The plant has whitish, fleshy rhizomes, or underground stems, of the thickness of coarse string or a stout knitting needle, at the nodes or joints of which buds are produced, and also adventitious roots. From the buds arise the upright-growing stems, which come above ground and bear the ordinary green leaves, and ultimately the ears or inflorescences of the Grass. The leaves are generally somewhat hairy on the upper surface, and at the point where the sheath and blade meet there are two hook-like ears or auricles which practically clasp round the stem.

The ears or inflorescences are placed at the end of the stems, which are 1 to 4 feet long, and the ears are built on the same plan as those of Wheat, the spikelets being arranged in two rows alternately on opposite sides of the main axis or stem. Each spikelet consists of three or five flowers, and is placed so that its flat or broadest face is next the axis, whereas in the ears of perennial Rye Grass, which those of Couch resemble superficially, the spikelets are arranged with the narrow, rounded face towards the axis of the ear.

The pest is propagated in two ways, namely, by seeds and by the underground rhizomes. Ordinarily the plants have not much opportunity to flower among farm crops, but flowering specimens are commonly seen in July and August in the hedgerows. The seeds ripen a little later and are

blown on to the land, where they germinate and produce a new crop of weeds. Sometimes the seeds are introduced in unclean samples of Grass and seed Oats. Though more couch plants arise from seeds than is generally supposed, the chief mode of propagation is by means of the creeping underground stems. These spread through the soil and soon form a dense mat of couch, which it is difficult to remove. In addition to natural extension from one point of the soil to another, the plant is inadvertently spread by the farmer during the cultivation of the land. The rhizomes get broken or cut up into short lengths by ploughs, hoes and cultivators, and are moved about in the soil by these implements. Each small piece on which there is a single joint or node has its bud and set of adventitious roots, and is virtually a complete plant capable of extensive growth. It will be readily understood that a single couch plant may become broken up into a large number of such growing pieces and soon cover a wide area of ground.

(2) BLACK "TWITCH" OR COMMON BENT.

Black "Twitch" (*Agrostis vulgaris*, With.) has a creeping habit, but its stems lie on the surface of the soil, and do not creep below like those of true Couch, while they are much thinner. In some districts this is far the more prevalent kind of Twitch, true Couch being comparatively rare. The leaves are short and flat, and dull green; in some forms smooth, in others rather rough. The inflorescence is a panicle with fine slender spreading branches and purplish-green one-flower spikelets of very small size. There are no auricles at the base of the leaf-blade, but there is a membranous structure—the ligule—where the blade and sheath join. In true Couch the ligule is absent or extremely short. These differences serve to distinguish Black Twitch from true Couch when the plants are not in flower.

Black Twitch, of which there are several slightly different varieties, is as troublesome as Couch, and is propagated in the same way, namely, by seeds and by its creeping stems.

(3) ONION "COUCH."

This plant (*Arrhenatherum avenaceum*, Beauv. var. *bulbosum*, Lindl.) is a variety of tall Oat-Grass met with locally, more particularly on the lighter class of soils. It is known as bulbous Oat-Grass, knot Oat-Grass and Pearl Grass, owing to the peculiar character of its swollen root-stock. Where it has once got possession of the land it is most difficult to get rid of it entirely. The characteristic features of this pest are the swollen internodes found at the base of the stems just below the surface of the soil. Each "onion," "bulb," "pearl," or "knot" is solid, smooth, and round, about the size of a large Pea, and is capable of withstanding drought for a long time. Several are joined together, and resemble a short string of beads. They are easily detached from each other by harrows and other implements, and as each little knob possesses a bud, the pest readily spreads over the land. The inflorescence of the plant is a large panicle, the branches of which are somewhat closely pressed to the main stem both before and after flowering. The spikelets and "seeds" are as large as those of a small Oat, and resemble them in form; the flowering glume has a bent, twisted beard or awn attached to it.

PREVENTIVE AND REMEDIAL MEASURES.

1.—As all these pests are spread by means of their seeds, which are easily blown about, every effort should be made to prevent flowering, and great care should be taken to procure Grass seeds and seed Corn free from the seeds of these weeds.

2.—Hedgerows must be kept clear of these pests, for seeds are freely disseminated from plants growing in such positions. Moreover, if the hedgerows contain Couch of any kind, it will grow out into the headlands, and the first harrowing spreads pieces of rhizomes or the small "bulbs" of Onion Couch further into the field, and year by year the weeds extend.

* Board of Agriculture and Fisheries (Leaflet No. 249).

3.—Where the Couch has become established, repeated ploughing, grubbing, and harrowing must be practised in order to reduce it. The land should be ploughed at first with a shallow furrow, and as much as possible of the weed collected by grubbing and harrowing when the soil is in just the right state of dryness to leave the roots and creeping stems of the weeds easily. The passage of a roller over the land greatly assists the harrows and cultivators to shake off the soil from the Couch and allow the collection of the weed in unbroken lengths. Especial pains should be taken in the case of Onion Couch to collect the detached "bulbs." After gathering together, the weed should be burnt in heaps and the ashes spread over the land.

Care should be taken not to grub or harrow in wet weather, especially on the heavier kinds of land, or much mischief will be done. When wet, the clods are cut or roughly broken by implements into irregular lumps rather than pulverised, and the creeping stems are severed into short lengths too small to be effectively gathered by any implement. A similar state of things also arises when the land is too dry. There is a time in the drying of ploughed land when the soil readily falls into a fine, crumbly powder, and leaves the roots and rhizomes of weeds clean, and it pays to examine the soil carefully from this point of view before attempting to drag out weeds from it.

4.—A short rotation, including extra root or hoed crops, will be of great value in combating all species of "Couch." After cleaning in the manner indicated under section 3, the land should be sown with Mangolds or other root crops, or with Beans, and the horse-hoe with grubbing tines should be kept at work between the rows as long as possible.

5.—Rape, Vetches, or other similar crops which will grow luxuriantly and smother weeds may be grown with advantage.

6.—In some cases isolated patches of Couch may be forked or dug out and carried off the land.

7.—Should Onion Couch have become so plentiful that a field is over-run with it, paring and burning may be necessary to eradicate it.

8.—Common Couch (*T. repens*) may be eradicated by laying land down to grass for three or four years.

SCOTLAND.

SALES FOR AGRICULTURAL PURPOSES BILL.

A largely attended meeting of the members of the Scottish seed trade was held recently to consider the Sales for Agricultural Purposes Bill so far as it affects their interests.

The chair was occupied by Mr. Bell, of the firm of Messrs. Bell and Bieberstedt, seed merchants, Leith, and among those who took part in the discussion were Mr. Mather, Kelso; Mr. Elder, Haddington; Mr. Cairns, Glasgow; and Mr. Thom, Ayr.

The principal objections to the Bill were regarding the clauses giving power to inspectors to enter warehouses and to take samples, also demanding, if they choose, the names and addresses of the sellers to the firm. The feeling of the meeting was in favour of a well-equipped testing station, where merchants and others could have their seeds tested before distribution, and farmers could have their purchases tested if they so desired.

It was agreed to send a statement recording the views of those present to Lord Clinton, the chairman of the House of Lords Committee on the Bill.

NEW PUBLIC PARK FOR MUSSELBURGH.

A NEW public park for Musselburgh, presented by Mr. C. D. Brown, Corstorphine, Edinburgh, and his brother, Mr. Julius A. Brown, California, in honour of their father, the late Bailie Brown, Musselburgh, was recently opened for public use by Mrs. C. Douglas Brown, after her husband had handed over to the Provost the deed of gift. The park is about 16 acres in extent, and has been laid out from plans prepared by Mr. J. W. M'Hattie, of the Edinburgh public gardens.

THE COUNTESS OF SELKIRK'S COTTAGE GARDEN PRIZES.

FOR a considerable number of years the Countess of Selkirk has offered prizes for the best kept cottage gardens and climbers on the estate of her late husband, the Earl of Selkirk, St. Mary's Isle, Kirkcudbright, and this year Lady Selkirk added to these a class for window boxes belonging to working men in the burgh of Kirkcudbright. Mr. Gilbert Anderson, Portmary Gardens, acted as judge, and visited the 34 gardens in the competition.

GRANT TO A HORTICULTURAL SOCIETY.

THE Dumbarton County District Public House Trust have granted the sum of £2 2s. to the Clydebank Horticultural Society, and £5 5s. to the same society for garden plots. The amounts are small compared with sums granted for other objects, such as bowling and other recreation clubs.

NEW PARK AT PORTSOY.

ON Coronation Day a new public park was opened at Portsoy, Banffshire, by Provost Smith, who is a generous benefactor to the burgh. At the opening ceremony Mr. Smith promised a gift of £1,000 for local purposes.

THE EFFECTS OF THE DROUGHT IN SCOTLAND.

THE complaints regarding the effects of the drought in Scotland are very general and point to a state of affairs which is rarely experienced. The drought is especially felt by fruit growers and market gardeners, and more than one grower of long experience state emphatically that the season is the worst in their recollections. Potatoes are the only crops which are satisfactory, and even these have suffered in some places considerably, with the result that a substantial advance in prices has taken place. Peas and other culinary produce are very scarce.

PERTHSHIRE FRUIT-PICKERS' WAGES.

THE labour unrest which has been manifested in various industries has also been prevalent in the Blairgowrie district of Perthshire, where the pickers employed at the fruit farms have been asking for higher wages and better sleeping accommodation. The general rate of payment has been ½d. per lb., but some growers have been giving ¾d., and, with a view to secure this rate generally, a meeting was recently held at Blairgowrie, when a resolution embodying the demands as indicated above was carried. The following forenoon a number of pickers went on strike because they were refused the ¾d. They secured employment elsewhere at the rate demanded.

TREE SET ON FIRE BY LIGHTNING.

AT Haddo House, the seat of the Earl of Aberdeen, on the 10th inst., a fine old Fir tree within the policies was struck by lightning when the storm was at its height. The lightning ignited the green tree, which continued burning for 24 hours. This is believed to be a unique experience so far as the effects of lightning are concerned in northern districts.

LAW NOTE.

FERTILISERS AND FEEDING STUFFS ACT.

At Wonford, Devonshire, on July 25, Horatio Clarence Furniss, of the National Guano Co., Liverpool, was summoned for selling a fertiliser with a false invoice. The fertiliser was deficient in soluble phosphates to the extent of 2.94 per cent., and Mr. Thos. Lambert, analytical chemist to the company, stated that the soluble phosphates must have been converted into insoluble phosphates by chemical reversion.

The Bench imposed a fine of £10 with costs.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

COLCHICUMS AS EARLY BULBS.—The season of the flowering of Colchicums began in July with *Colchicum odoratum*, a species much resembling *C. agrippinum*. This was followed during the early days of August by *C. lingua-tum*, which has a large-sized rose-coloured flower. From now onwards we shall not be without Colchicums until after the end of the year. *T. Smith.*

"COVERING THE UNION" (see p. 114).—Will Mr. Slade explain what special motive he has for planting grafted Apple trees so low down that the union is covered with soil and also how the healthiness of that union is affected by a covering of soil? Does he assume that the soil covering induces roots to grow from the grafted tree above the union, or does he mean to convey the impression that the coating of soil checks canker, whilst exposure of the union to light and air favours this disease? But this argument seems to be based on the assumption that Apple trees, Cox's Orange Pippin, or any others, are prepared in nurseries for sale by grafting, whereas it is well known that the great majority are propagated by budding, which produces a very different union from that of grafting. Large numbers of Apple stocks headed high up and grafted on perhaps numerous stems, carry robust, healthy heads for many years, yet the graft unions are not covered with soil. But after all, has not root action and the kind of soil more to do with the spread of canker than anything else. Large numbers of trees, including Cox's Orange Pippin, if planted in a sweet, well-drained soil, the roots being kept near the surface by feeding, remain for a long time healthy. But how many of such trees have been ruined in market orchards by the practice of planting bulbs between the rows or of otherwise surface cropping, with the result that the trees only possess deep-growing roots, not only because the soil is exhausted by the surface crops, but also because the ploughing or digging destroys any surface roots that are formed. When Mr. Slade refers to the approved Paradise stock, presumably he means the broad-leaved or so-called English Paradise, which is held to have originated at Sawbridgeworth. *D.*

ROSA HEMISPHERICA.—That this Rose is shy to bloom is accounted for by the improper treatment it receives. The plant flowers annually at Tynningham, and so freely that the flower-buds need to be thinned. The variety does not even require to be planted against a wall as many suppose. As I advised in a recent Calendar on the Flower Garden, under its old name of *R. sulphurea*, the older shoots should be removed after the flowers are over and only a few of the stronger young ones left, which produce flowers from almost every bud. The variety was first introduced to England about 1600, but it was lost; not long afterwards John de Frangueville reintroduced plants, and in 1629 the species seems to have been common in cultivation. *Rosa hemisphaerica* is undoubtedly one of the most beautiful of yellow Roses, both in form and colour. *R. P. Brotherston, Tynningham, Gardens.*

THE WASP PLAGUE.—In addition to the profuse dropping of Apples, which is mentioned in reports from various parts of the country in the Board of Agriculture Report for August, the fruit grower is troubled with the worst plague of wasps which has been known in my experience. These insects have damaged far more Apples than birds have spoilt this season, although about 40 nests have been destroyed on my farm. They do not wait for birds to peck holes for them, but eat their way through the skin and leave little but skin when they have done with a fruit. This is another inducement, in addition to the dropping of the fruit, to gather Apples before the usual time for each variety. There is a great disadvantage in this proceeding, as the markets are likely to be glutted with Apples thus prematurely gathered. In the case of Plums, if any are left to ripen fully they are consumed by wasps. I have lost some bushels in this way. *A Southern Grower.*

"MIMICRY" IN PLANTS.

THE interesting series of photographs reproduced in figs. 63 and 64 illustrate how remarkable are the resemblances which may exist between plants belonging to widely separated families; for example, between *Cotyledon linearis*

and that when the mimicker bursts into flower the disguise is thrown off and the plant stands revealed for what it is.

Though we may use the term "mimicry" to denote these striking resemblances between widely-separated species, it is as well to remember that the term does not imply anything more than.

theory can be put forward on behalf of "plant-doubles." Just as misery makes strange bed-fellows, so certain conditions of life induce in plants definite physiognomies, and if dissimilar plants are exposed to similar conditions, there arise, though it is true but rarely, close resemblances between plants originally quite unlike one another. The fact that mimicker and mimicked among plants may come from opposite ends of the earth is sufficient in itself to do away with the necessity for any such explanation as that put forward by zoologists and to show that mimicry among plants is but a curious exercise on the part of "the long arm of coincidence."

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 64-70.)

(Continued from page 116.)

4, MIDLAND COUNTIES.

NORTHAMPTONSHIRE.—Damsons, Plums, and Walnuts are very plentiful. Apples also are very good, but the trees are rather blighted. The Corn crops are looking well, but the Hay crop was a very light one. Root crops are late. *Thos. Masters, Lower Shuckburgh, Daventry.*

— The fruit crops in this district are, with the exception of small fruits, below the average in yield. Plums vary greatly; in some places the trees are heavily cropped, whilst in others they are bare of fruits. The Apple crop is the best. Pears are very scarce everywhere. Of bush fruits, Gooseberries are the best, and Black Currants the worst. *T. Foster, Biddlesden Park Gardens, Brackley.*

NOTTINGHAMSHIRE.—Apples are a heavy crop. Pears, Apricots, and Plums are not so good, although the trees were covered with blossom, and at one time promised to give good crops. When the fruits were of the size of Peas many of them turned yellow and dropped, owing to the strong gales of wind which prevailed whilst the trees were in flower. Peaches and Nectarines are very good crops, and the fruits are of fine quality. Strawberries were a heavy crop, and the berries of excellent quality. Sweet Cherries also were plentiful, but Morello Cherries are only average. All other small fruits are plentiful and of splendid quality. Early Potatoes have done well. Our soil is light in texture, and it rests on a subsoil of sand. *James B. Allan, Osherton Gardens, Worksop.*

— Apples are patchy, some trees have full crops, whilst others have very few fruits. Plums and Pears are much under the average. We do not remember such a marvellous show of blossom; all the trees were smothered with bloom, but the individual flowers were not of large size, and, owing to the cold weather, but few insects were observed. Plums and Pears fell off when they seemed to be setting, and many Apples fell during the drought. Gooseberries are very fine, but Currants and Raspberries are of small size owing to the dry weather. Strawberries were a grand crop, but after a long period of drought $1\frac{1}{2}$ inch of rain fell just as the berries were at their best, and many were spoiled. Attacks of aphids have been very severe, and constant sprayings have been necessary. *J. R. Pearson & Sons, Loddham.*

OXFORDSHIRE.—This was a record year for blossom on all fruit trees, and with one or two exceptions the result is most satisfactory. Blight was very prevalent, but some heavy thunder showers helped to clean the trees of the pests. Another storm is needed to free the Beans from aphids, as no amount of syringing will check the pest. Our soil is a light loam on chalk and gravel, and the crops soon feel the effects of a dry summer. *John A. Hall, Shiplake Court Gardens, Henley-on-Thames.*

— With the exception of Pear trees all other trees had really too much blossom. The result is that some trees have too much fruit, and where Apples and Plums have not been thinned in good time they will be under an average size. This is a Cherry county, and although the trees presented such large masses of bloom, the crops (except here and there) are

FIG. 63.—PLANT MIMICRY.

Pelargonium sp. collected by Prof. H. H. W. Pearson in Namaqualand.

Euphorbia sp. from Transvaal collected by Mr. Galpin, No. 7,950.

(Crassulaceæ) and *Euphorbia balsamifera* (Euphorbiaceæ). It is noteworthy that the latter family is peculiarly adept at producing these vegetable doubles. One unnamed species of *Euphorbia* from the Transvaal is the very image of a species of *Pelargonium* collected by Professor Pearson in Namaqualand (fig. 63). *Euphorbia polygona* from South Africa and *Cereus polylophus* from Mexico are almost as like as identical

a chance and casual though close similarity between certain pairs of plants. Indeed, "plant-doubles" would be a more appropriate term. Among zoologists the term "mimicry" has a more precise significance, and those who follow Darwin and Bates seek to explain cases of mimicry among insects in terms of utility. The mimicking insect is supposed to have gradually assimilated its form to that of the mimicked species

[Photograph by C. P. Raffill.]

FIG. 64.—PLANT MIMICRY.

A, *Cotyledon linearis* (California). B, *Euphorbia balsamifera* (Canaries). C, *Cereus polylophus* (Mexico). D, *Euphorbia polygona* (S. Africa). E, *Echinocactus macrodiscus* (Mexico). F, *Euphorbia meloformis* (S. Africa).

twins, and, as indicated in fig. 64, *Euphorbia balsamifera*, a native of the Canaries, "imitates" the Californian *Cotyledon linearis* with flattering closeness.

It need scarcely be remarked that these resemblances are confined to the vegetative organs,

and to secure protection from the fact that insect-eating enemies may mistake it for the noxious species which it resembles. Whether or no this theory of insect mimicry will stand the test of criticism is a matter of dispute between rival schools of zoologists. In any case, no such

disappointing. Bush fruits and Strawberries are very good. Our soil is shallow and stony. *A. J. Long, Wyfold Court Gardens, Reading.*

— Apples in this locality are exceedingly good, in both clay and gravelly districts. Pears are not plentiful; many fruits were affected with the Pear midge (*Diplosis pyrivora*). Plums are a very heavy crop, but the trees are smothered with aphids. Peaches and Nectarines are good, even crops generally. The flowers of Apricots were, in many instances, very small and deformed and failed to set satisfactorily. Cherries, Strawberries and Black Currants were badly affected by drought during May, and although plentiful, the fruits were small. Red and White Currants, Raspberries and Loganberries are all splendid crops. *F. W. Pearce, Eynsham Hall Gardens, Witney.*

— Apples are dropping very badly, owing to drought. We had a few Black Currants only, the bushes being blighted, and the same remarks apply to the Cherry crop. Strawberries were a glut, but they were soon over. *A. W. Perry, Middleton Park Gardens, Bicester.*

— I attribute the scarcity of Peaches and Apricots to cold winds, which prevailed when the trees were in bloom; there was a splendid show of blossom. *T. Whiting, Shotover Park Gardens, Wheatley.*

— Apples are a very fair crop. Trees of Peasgood's Nonesuch, Lane's Prince Albert, Blenheim Pippin, Cox's Orange Pippin, and Duchess of Oldenburg are all carrying heavy crops. Pears are rather scarce: the fruits set very badly, owing to the cold winds at the season of blooming. Plums are very good. The following varieties are yielding good crops: Early Rivers, Kirk's, Victoria, Jefferson, Coe's Golden Drop, and Cox's Emperor. Cherries were a very satisfactory crop, especially such varieties as Early Rivers, Governor Wood, Black Eagle, and Archduke. Peaches and Nectarines are scarce, owing to the frost at the time when the fruits were setting. Apricots were affected at the same time. Black Currants, Red Currants, Raspberries and Gooseberries were excellent crops, Raspberries, in particular. Strawberries have also been a fine crop, and the fruit has been up to the best standard, but the season was a short one, owing to dry weather. Nuts are abundant, but the trees require rain. Our soil is of a very light nature, and the fruit trees require heavy mulchings in a dry season. *Geo. Hunter, Blenheim Palace Gardens.*

SEROPSHIRE.—Owing to the hot, dry weather Apples are dropping freely. Blight also has been very troublesome. Raspberries were a very good crop, but the fruits were not so large as usual. Strawberries have been plentiful and the berries fine, but the season was a short one. Apricots are a very poor crop, owing to cold weather and late frosts in spring. Peaches are very unsatisfactory in the open, although there was plenty of blossom. *George Risebrow, Hatton Grange Gardens, Shifnal.*

— The Apple crop in this neighbourhood varies considerably. Trees of Cox's Orange Pippin, Worcester Pearmain and Devonshire Quarrenden are carrying very large crops. Lord Suffield, Lane's Prince Albert, and Lord Derby are also grand crops amongst culinary sorts, but trees of many others, including Bramley's Seedling, are almost fruitless. Cold winds whilst the trees were in flower may have been the cause of the failures of most sorts, for all the trees flowered well, although some of the flowers seemed weak. Strawberries gave the best crop for many years, especially late varieties, such as Givon's Late Prolific, and Laxton's The Latest. *Alex. Haggart, Moor Park, Ludlow.*

— Blight has affected most of the fruit trees, and this, with cold winds in spring, has spoiled the fruit crops. Peaches and Nectarines are the worst crops for 40 years. There was a good show of blossom, but the cold winds destroyed the young fruits. We have more blight on the foliage of Plums than I have ever known, and the blight has been followed by an attack of aphids. The intense heat dried up Strawberries and Raspberries. Black Currants were very badly blighted. Taken altogether, this is a very trying

and disappointing season. *J. Taylor, Hardwicke Grange Gardens, Shrewsbury.*

WARWICKSHIRE.—What promised at one time to be a very good fruit year is disappointing. Apricots and Peaches were injured by east winds during the flowering period, and failed to set. Plums suffered a good deal from the hot, dry weather in May, also from blight, and many fruits dropped. Strawberries were earlier than usual, and, although they cropped well, were soon over, owing to dry weather and a light soil. Small fruits were well up to the average, with the exception of Black Currants. *H. F. Smale, The Gardens, Warwick Castle.*

— Considering the large amount of blight on the trees this year, the fruit crops in these gardens are very satisfactory. Gooseberries, Red Currants, Raspberries, and Strawberries were abundant crops. Black Currants promised well, but, owing to blight, the bushes are quite bare of fruit and foliage. Apples, Plums, and Damsons are all good, but Pears are a poor crop. *Chas. Harding, Ragley Hall Gardens, Alcester.*

5, SOUTHERN COUNTIES.

BERKSHIRE.—Dessert Pears are below the average, due, I believe, to an absence of sunshine last season, with the result that the wood did not ripen properly. The Apple crop is much better than was expected earlier in the season. We have no Plums on standard trees, which I attribute to the same cause as the failure of Pears. Black Currants are very bad, but Red and White Currants are good. Raspberries were an average crop, and Gooseberries were very good; Loganberries also are good. Strawberries suffered considerably from drought. *F. Capp, The Gardens, Charters, Ascot.*

— Although spring gave promise of such an abundance of fruit, the crops, generally, are rather disappointing. Pears and Plums have dropped considerably. Peaches have suffered much from aphids, and this crop is almost a failure. Raspberries and other small fruits were badly affected by heat and drought, our soil being light and porous. Walnuts and Cobnuts are good crops. Strawberries were a heavy crop, but the season was of short duration. Apples are a good crop, but the fruits are rather small, and are now feeling the effects of drought. *J. Howard, Benham Park Gardens, Newbury.*

— Apple trees flowered freely, and such varieties as the following, amongst others, set good crops:—Irish Peach, Lane's Prince Albert, Beauty of Bath, Newton Wonder, Cox's Orange Pippin, Potts's Seedling, Allington Pippin, Lord Derby, Duke of Devonshire, Lady Sudeley, Sandringham, Ribston Pippin, Peasgood's Nonesuch, Miller's Seedling, Beauty of Hants, Warner's King, Bismarck, and Mère de Ménage. *W. Fyfe, Lockinge Gardens, Wantage.*

— All fruit crops here are good, with the exception of out-door Peaches and Apricots, which were blighted early in the season. Strawberries have been good, the best varieties this year being Royal Sovereign, Epicure, Pineapple, Givon's Late Prolific, Waterloo, and Laxton's Perpetual. Epicure is a splendid cropper, the fruits being of good flavour and colour. Apples are an abundant crop, and the trees are healthy. All bush fruits are good. Pears are good on Cordon trees, the foliage and fruits being clean and free from spot. *A. B. Wadds, Englefield Gardens, Reading.*

DORSETSHIRE.—Judging by the amount of blossom on fruit trees of every kind, this should have been a record fruit year, but the early promise has not been fulfilled. The weather was bleak and cold, east winds and frosts prevailing for a long time when Apricots were in bloom, and although the Apricot trees were protected by a glass coping and nets, the crop is small in comparison to the large amount of blossom. The great majority of Apples have done very well. Aphids of various sorts has been very persistent on Cherry and Plum trees, causing much trouble in washing and spraying. Bush fruits are excellent. Strawberries had to be freely watered when the berries were swelling, and again now to save the plants from dying. Our Gooseberries just escaped a severe frost, the flowers not being

quite expanded at the time. I hear of others who have short crops of Gooseberries. Our soil is of a dark, friable nature with a fairly good clay subsoil. *A. Shakelton, Forde Abbey Gardens, Chard.*

— Apples may be considered an average crop of good quality fruits on both bush and orchard trees; it is certainly a Cox's Orange Pippin season, this variety being good alike on both bush and orchard trees. Pears are a very poor crop. The blossom set on wall trees, but the fruit dropped after it had grown to a considerable size. Plums are an average crop of most kinds, but aphids has been more than usually troublesome this season. Sweet Cherries have been the best crop in my recollection, but Morellos are a much lighter crop. Peach and Nectarine trees grow too strongly in our clayey soil to ripen the wood in such sunless seasons as those of 1909 and 1910. The same remark applies to Apricots, which have partly failed two seasons in succession. We experienced the coldest weather of last winter from April 4 to 8 inclusive, when we had as much as 10° of frost with a cold, north-east wind. Bush fruits were in full bloom at the time, and, in consequence, we had a thin crop of Gooseberries, but Currants were better. Strawberries were most satisfactory. *T. Turton, Castle Gardens, Sherborne.*

— Apples promise well for a good crop, unless drought continues. Several sorts of Pears are cropping well. Plums are a good average crop. The trees have been badly attacked with aphids, which the hot weather has favoured. Both sweet and Morello Cherries have done well, though the fruits were small, owing to the drought. Gooseberries proved a very heavy crop, and Currants a good average one. Strawberries flowered most profusely, and the fruits set well, but the extreme heat and lack of rain shortened the season. Walnuts are a heavy crop, but other Nuts are scarce. The soil here is rather light and shallow, resting on chalk. *Thos. Denny, Down House Gardens, Blandford.*

— The fruit crops on the whole are very satisfactory. Raspberries and all kinds of bush fruits proved extra heavy crops. Strawberries gave an enormous crop, the berries being large and of excellent flavour. Two-year-old plants of Givon's Late Prolific produced some grand berries. The rains during the heavy thunderstorms experienced during the latter part of May and the first week in June helped to swell the fruits. On June 5 the rainfall registered 0.94 inches, and for the whole month of June 2.85 inches. Apples are a very heavy crop, and the fruit appears to be clean and free from spots. Constant spraying both winter and summer is practised in these gardens. *J. Rogers, Langton Gardens, Blandford.*

— The cold weather in April damaged many of the fruit blossoms, and Raspberries suffered severely from this cause. Strawberries have been abundant, but the berries were small. Givon's Late Prolific yielded the largest fruits. The out-door crop of Figs promises to be a good one. Pears are scarce, the April frosts and cold winds doing much damage to this crop. The garden is situated on a slope facing south by south-east. The natural soil is fairly stiff in texture, but shallow; the subsoil is chalk, with, in places, clay and flints. *J. Jaques, Bryanston Gardens, Blandford.*

— There was every prospect of a good fruit season, but owing to the excessive drought and heat Plums and Cherries dropped freely, but Apples and Pears are very good indeed, and especially Apples. Gooseberries and Currants are better than usual, but the Raspberries and Strawberries were dried up. With the exception of two showers on June 15 and 25 respectively, we had seven weeks of dry weather and very hot sunshine. In several instances the thermometer rose to 110° Fahr., and in one case it went to 120°. The soil in which most of our fruit trees are growing is a clayey loam with an ironstone subsoil. Generally the fruit crops in this district are good. *H. Kempshall, Abbotsbury Gardens.*

HAMPSHIRE.—Apples are a plentiful crop, the trees clean, and making plenty of healthy growth. The hot weather is causing some of the

fruit to drop, but not to any serious extent. All varieties are well laden, especially Cox's Orange Pippin, Worcester Pearmain, Lady Sudeley, Bramley's Seedling, Lord Grosvenor, Lane's Prince Albert, Mère de Ménage and Bismarck. Strawberries were an enormous crop of good fruits. The varieties Royal Sovereign, Bedford Champion, Leader, and Sir Joseph Paxton are the most popular sorts. Bush fruits, including Raspberries, Gooseberries, and Currants, have all cropped well. *E. Molyneux, Swanmore Park, Bishop's Waltham.*

—The fruit crops in this neighbourhood are disappointing. Trees and plants of every variety of fruit blossomed abundantly, but the results are far from satisfactory. Apples are a good average crop of clean fruits, but the trees were attacked by caterpillars. Apricots are very scarce, and the trees have been attacked by aphids. Pears are a light crop, but the fruits are clean. Of small fruits Gooseberries and Red Currants are the best crops. Black Currant bushes were badly infested with aphids early in the season, and never seemed to recover from the bad effects. Strawberries were a good average crop of sound fruits, but owing to the heat and drought the berries were soon over, as were also Raspberries. *A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.*

—Apple trees are looking very well and carrying an enormous crop of fruits. Pears, although the trees were protected with nets, are very scarce. Fruits of Plums and Cherries set well, but owing to dry weather during the end of May and the beginning of June about two-thirds of the crop dropped prematurely. Gooseberry and Currant bushes have a fair crop of clean fruits, the plants having been sprayed. The soil here is light and gravelly, resting on clay. *R. Learmouth, Sherfield Manor Gardens, Basingstoke.*

—All fruit trees blossomed well, especially Apples, which are carrying a good crop of fruits. Strawberries were an extra large crop, especially of the varieties Royal Sovereign and The Laxton. Currants, Gooseberries, and Loganberries are all excellent crops. Cherries are not largely grown in this district, the soil being deficient in lime and not suited for stone fruits. *Henry Martin, Bartley Lodge Gardens, Cadnam, Southampton.*

—There was a splendid show for all kinds of fruit early in the season, but a heavy fall of snow and late frost in May ruined the prospects, besides which green and black aphids have been unusually numerous. Strawberries have been very plentiful, whilst Gooseberry bushes are breaking down with the weight of fruits. Dessert Cherries are a failure, although Morello's are very good. Plums on wall trees are very satisfactory. *R. G. Onslow, Dogmersfield Park Gardens, Winchester.*

—Apples are a splendid crop and the fruits very clean, the trees being free from aphides, with but few caterpillars. Pears are generally a thin crop, but the fruits are of good quality. Gooseberries, Red and Black Currants are very full crops. Raspberries and Strawberries are excellent, both in crop and quality. Our soil is a medium to heavy loam, with clay and flint subsoil. The gardens are situated 500 feet above sea level. The rainfall from January to June 30 amounted to 11.52 inches; during 1910 to 19.37 inches. *A. W. Blake, The Castle Gardens, Highclere.*

KENT.—Apples are very patchy. A few orchards have more than an average crop, whilst others have considerably fewer. It may be interesting to relate that almost all varieties of the Codlin type are cropping well. Lord Suffield, Golden Spire, Mank's Codlin, Keswick Codlin, Cox's Orange Pippin, and Ribston Pippin are all carrying average crops. Other varieties are much below the average. Pears are not only a poor crop, owing to the effects of the Pear Midge, but the fruits are badly attacked by black scab disease. Plums and Damsons promise well. Cherries are cheap and good, the crop being above the average. Small fruits, and especially Gooseberries, are quite up to the average quantity, and of good quality. Owing to the want of rain, Strawberries were over somewhat early; still, there was a big crop of splendid quality berries.

Nuts promise well. *George Woodward, Barham Court Estate Gardens, Maidstone.*

—The promise of an abundant yield was marred by the snow and frosts in May. The amount of blossom was wonderful, but Currants and Gooseberries have "run off" and Pears of choice sorts are very scarce. Aphides have been very numerous, and only kept under by diligent sprayings. Apples on the Paradise stock, planted about 16 years, are a splendid crop. Out of 400 varieties only two have failed to bear, so much for inter-pollination. Our soil is of the lower greensand stone formation, the nursery being situated 80 feet above the sea level. *George Bunyard, Maidstone.*

—The early prospects of a general good crop of fruit will not be realized. Apples have dropped very considerably, whilst Pears on many trees in the open have almost all fallen. Plums appeared not to set satisfactorily, and at the present time the trees are badly infested with aphids. The Strawberry season, though short, was satisfactory, the fruits being abundant and of exceptionally fine flavour. *Geo. Fennell, Bowden Gardens, Tonbridge.*

—The finest crops in this district are very uneven; in some places they are very good, and in others unsatisfactory. Apples are a good crop, but Pears are scarce in most places. Plums are a thin crop. Strawberries were plentiful and of fine quality. Sweet Cherries and Raspberries are very good, but Black Currants are scarce. No doubt the frost early in June was the cause of the fruit crops in general being so uneven, as the appearance of the trees in the early spring could not have been better. The soil in this district overlies the chalk, and some of the soil is of very good quality. *J. T. Shann, Betteshanger Park Gardens, Eastry, Dover.*

—Small fruits are much earlier than usual in this district. Strawberries were a heavy crop, and the berries of good flavour, but owing to the prolonged drought the latter part of the crop did not ripen properly. Currants and Raspberries are both very good indeed. All fruit trees bloomed profusely, but Pears did not set well, and the crop is a thin one. Plums are an excellent crop in this district. Nuts promise to be plentiful, and Loganberries also are fruiting well. The soil here is a heavy, retentive loam, and crops generally do well in a hot season. *J. G. Weston, Eastwell Park Gardens, Ashford.*

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 15.—The Committees met as usual on Tuesday last, but there was no exhibition, workmen being in possession of the Hall, which is being redecorated. Only a few Committeemen were present in each section. Exhibits presented before both the FLORAL and FRUIT AND VEGETABLE COMMITTEES were of very little importance, and neither committee granted an Award; but the ORCHID COMMITTEE found plenty to do, and granted one First-class Certificate and three Awards of Merit.

Floral Committee.

Present: George Gordon, Esq. (in the Chair); and Messrs. E. H. Jenkins, Charles E. Pearson, Herbert J. Cutbush, J. W. Barr, W. J. Bean, and John Green.

Three scented-leaved Pelargoniums and a Zonal-leaved variety were presented for awards, but they showed no advance on existing varieties. These subjects were all the Committee had to consider, beyond a Fern submitted for naming.

Orchid Committee.

Present: William Bolton, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), J. Charlesworth, W. H. White, and Walter Cobb.

Messrs. CHARLESWORTH & Co., Haywards Heath, showed the rare *Houlletia Wallisii* with decumbent spikes of wax-like, pale yellow flowers spotted inside with red. The plant was referred to the Scientific Committee at its next meeting. This firm also showed the new *Odontonia Louise*

(*Miltonia Warscewiczii* × *Odontoglossum Ossulstonii*) with pretty blush-white and rose-coloured flowers, and *Pescatorea Roezlii superba*, the handsome white flowers being tipped with crimson.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed a magnificent spike of *Lissochilus giganteus* about 12 feet in length, with 30 large, rose-coloured flowers as well as several buds; also *Trichopilia Lehmannii*. (See Awards.)

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park, Reigate (gr. Mr. Collier), showed *Odontodia Graireana* (*C. Noezliana* × *O. Rossii*) with sepals and petals spotted with red, the whitish lip having rose-coloured markings.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Laelio-Cattleya Lady Chance* (*L.-c. elegans* Turneri × *C. bicolor*), a pretty hybrid having bronzy-rose sepals and petals, and a purple lip with white base.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), exhibited the very richly-coloured *Sophro-Laelio-Cattleya Goodsonii* (see Awards), and *Laelio-Cattleya Ernestii* (*L.-c. Ingramii* × *C. Dowiana aurea*), a large and handsome flower of a clear rose colour with maroon front to the lip, which has an orange-coloured disc.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Cattleya Rhoda* Fowler's variety (*Iris* × *Hardyana*), a beautiful flower with greenish-primrose sepals and petals and deep claret-coloured lip.

Messrs. SANDER & SONS, St. Albans, showed *Cattleya vivicans* (*velutina* × *Fabia*), a pretty flower with brownish-rose sepals and petals and broadly developed rose-veined lip; also *C. micans* (*Warscewiczii* × *Wavriniana*) and *Brassocattleya Pluto* var. *pulchra*, a nearly white form.

MESSRS. STUART LOW & Co., Bush Hill Park, Enfield, showed *Cattleya Thurgoodiana* (*Hardyana* × *Luddemanniana*), a very fine flower closely resembling *C. Warscewiczii*; also a pretty form of *C. Dowiana* with rose frecklings on the petals.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Rhoda var. *illuminata* (*Hardyana* × *Iris*) from Messrs. CHARLESWORTH & Co., Haywards Heath.—The most beautiful of the remarkable hybrids of this cross raised by Messrs. CHARLESWORTH & Co., and which have exhibited such extreme variation, one section partaking strongly of *C. bicolor*, derived through *C. Iris*, whilst those of the other type are of the form and size of *C. Dowiana aurea* inherited from *C. Hardyana*. The present flower is of the size and shape of *C. Dowiana Rosita*, the broad sepals and petals being a bright yellow colour tinged and veined with rose; the expanded and finely-crimped front of the lip is coloured deep claret-crimson, the tube is orange with fine purple lines at the base.

AWARDS OF MERIT.

Trichopilia Lehmannii, from Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White).—A charming species of the *Pilumna* section, described by Dr. Regel and distinct from its ally *T. fragrans* (*Pilumna fragrans*, *Botanical Magazine*, t. 5035). The charming snow-white flowers, developed three or four on a spike, have the sepals and petals nearly equal, narrow and undulate, the large white labellum having an orange-coloured disc. The plant bore 13 flowers.

Sophro-Laelio-Cattleya Goodsonii (*Sophro-Laelia heatonensis* × *Laelio-Cattleya luminosa*), from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day).—A very brightly-coloured hybrid with flowers of good size, bronzy-rose on the backs of the sepals and petals and rose-purple with a yellowish shade on the surface, the elongated front of the lip being claret colour.

Gongora leucochila, from Messrs. CHARLESWORTH & Co., Haywards Heath.—A beautiful *Gongora* and one of the largest flowered. The large fleshy lip is pure white, differing from the original form figured in *Flore des Serres*, vol. 1., p. 87, in having a large chocolate blotch on each

side. The sepals are white inside and purple on the backs; the column and other segments are spotted with purple.

Fruit and Vegetable Committee.

Present: J. Cheal, Esq. (in the Chair); and Messrs. O. Thomas, J. Davis, J. Willard, E. Beckett, A. Dean, G. Wythes, A. R. Allan, and H. Markham.

Messrs. BARR & SONS, King Street, Covent Garden, showed two fine Melons of the variety Mandie Castle, which received an Award of Merit when grown under trial at Wisley last year. Both the fruits were of good size, but they differed in appearance, one being yellow and very lightly netted, the other browner in tint, and heavily netted. The first-named was not good, but the second one was exceptionally delicious, the flesh thick, succulent, and of a greenish-white colour. The Committee agreed to recommend the Council to hold an extensive trial of Melons at Wisley next year.

The Superintendent showed from the Society's gardens at Wisley heavily-fruited plants of Tomatos, including the varieties Coronation (the seed having been sent by Mr. A. Michelson, Barnett Hill Gardens, Guildford), Early Crimson (from Mr. T. Hancock, Mansfield), and Smart's Finality (from Mr. A. J. Platten, Lowestoft). All were of the red, round-fruited type, and bore capital crops. At Wisley, grown in quantity with other standard varieties, these varieties did not exhibit exceptional merit.

KIRKCUDBRIGHT HORTICULTURAL.

AUGUST 1.—The annual show of the above society was held in the Town Hall, Kirkcudbright, on this date. There was a reduction in the number of entries from last year, but there was no appreciable falling off in the quality of the exhibits, save in those of cut flowers.

In the open class for pot plants Colonel GORDON, Threave (gr. Mr. J. Duff), was awarded the 1st prize, with a well-arranged exhibit of plants of admirable growth. Mr. W. BROWN, Shillinghill, an amateur cultivator, was the most successful exhibitor of pot plants in the other classes.

In the cut flower section Colonel GORDON was also highly successful, the bulk of the 1st prizes falling to the exhibits from Threave, but the Misses ANDERSON, Park House (gr. Mr. J. Walker), won the 1st prize in the class for herbaceous plants, and Mr. W. BROWN, Barwhinnoch, and Mr. W. W. MORRISON, with Mr. J. SCOTT, were also 1st prize winners.

A few of the best South of Scotland fruit growers exhibited, and, in consequence, this section was very good. Colonel GORDON, whose gardener, Mr. J. Duff, is a frequent prize-winner at leading Scottish shows, excelled in the classes for Grapes and in most of the other classes, although another successful exhibitor, Mr. B. RUTHERFORD, gardener to Major Maxwell of Glenlair, showed well also, and won several 1st prizes. In the vegetable department Colonel GORDON was again a successful exhibitor.

BISHOP'S WALTHAM HORTICULTURAL.

AUGUST 2.—The 37th annual show of this society was held in Swanmore Park by permission of W. H. Myers, Esq., who by throwing open his pleasure gardens and grounds to the visitors contributed very considerably towards the success of the exhibition. Originally this society was started for the benefit of the cottage gardeners, and one of the chief classes was for the best cultivated garden. Latterly the society has done much to encourage exhibits of table decorations and other floral arrangements, offering substantial cash prizes. This year a marquee 80 feet by 30 feet was required to contain the exhibits in this department; as many as 27 tables were arranged in competition. Mr. E. Molyneux is the hon. secretary, ably assisted by Miss F. M. Molyneux and an efficient committee.

The leading class was for a decorated dinner table 6 feet by 3 feet, Orchids and Carnations excluded; £5, £3, and £2 were the prizes offered. Fourteen competed, making a fine display.

Mrs. ARTHUR BIDE, Highlands, Guildford Road, Farnham, was awarded the 1st prize for an arrangement of Lyon and Irish Elegance Roses

with suitable bronzy foliage all harmoniously blended. Miss GERTRUDE SAUNDERS, Creunphere, Fareham, was a very close 2nd with a similar arrangement of the same Roses. For an equal sized table decorated with Sweet Peas and any foliage there were nine entrants. Mr. F. G. BEALING, Bassett Nursery, Southampton, secured the premier place with orange and pink varieties, set off by small leaves of Caladium. 2nd, Miss HATTIE VOKES, Birch Lawn, Sholing, Southampton, with pink and heliotrope varieties. Miss ELSIE COLLINS, Swanmore, showed the best display of wild flowers.

In a class restricted to lady members, Mrs. PERN, with a pleasing arrangement of Fair Maid Carnations, tinted and green foliage, secured the premier position.

Exhibits of fruit were good in quality, although small in numbers. For four varieties, Mr. W. H. MYERS, Swanmore House (gr. Mr. P. Ellwood), won the 1st prize with a desirable collection; 2nd, Mrs. MACRAE, Meonstoke House (gr. Mr. H. Childs). T. WILSON, Esq., The Thickets, Bishop's Waltham (gr. Mr. G. Barnes), showed the best four dishes of fruits grown in the open, having handsome Peaches, Red Astrachan Apples, and Cherries. There was a keen competition in the vegetable classes, for prizes offered by Messrs. Sutton & Sons, Toogood & Sons, James Carter & Co., and Ed. Webb & Sons. Mr. W. H. MYERS won the 1st prizes in all four classes, followed by Mr. WILSON and Mrs. MACRAE.

WESTON HORTICULTURAL.

AUGUST 3.—The annual exhibition of the above society, held in Grove Park and the grounds of Glebe House on this date, proved a great success. Happily the weather, though extremely doubtful and threatening in the early morning, when indeed rain fell heavily, proved beautifully fine later. Last summer, after a lapse of some years, the show was resuscitated through the energy and initiative of a few local gentlemen.

The number of entries was larger than at last year's show, whilst the quality of the exhibits was on the whole very satisfactory. The number of classes was also increased from last year, thus introducing more variety.

Mr. C. J. ELLIS won Mr. C. A. Coggins' cup (offered in the local plant classes), for the second time in succession, and thus it becomes his property. Mr. H. CORNELIUS had a splendid group of Caladiums and specimen plants, and carried off one prize over the head of Mr. Cypher.

BLETCHLEY AND FENNY STRATFORD HORTICULTURAL.

AUGUST 7.—The second annual flower show of this and Fenny Stratford Horticultural Society was held in Bletchley Park (lent by Sir Herbert Leon) on Bank Holiday. The programme was carried out on the same lavish scale as last year's successful initial venture, and the visitors numbered considerably more than 10,000. Mr. T. Best capably fulfilled the duties of secretary.

BISHOP'S STORTFORD HORTICULTURAL.

AUGUST 7.—The 42nd annual exhibition of this old society was held this year on Bank Holiday instead of the second Wednesday in August. There was a large attendance of visitors, and there were some remarkably good exhibits. The class for a group of plants is always keenly contested, and for the past three years Lord HOWARD DE WALDEN, of Audley End, Saffron Walden (gr. Mr. J. Vert), has won the 1st prize, but this year Mr. Vert was 2nd to the Hon. MAURICE GLYN, Albury Hall, Herts. (gr. Mr. F. T. Bradley). Both exhibits contained remarkably fine plants, but the 1st prize collection was the more lightly and artistically displayed; the 3rd prize was won by Sir JOHN BARKER, Bart., The Grange, Bishop's Stortford (gr. Mr. Beech). In the class for six distinct foliage plants, Lord HOWARD DE WALDEN was placed 1st and Sir JOHN BARKER 2nd.

In the class for 24 bunches of hardy perennials, Messrs. GEORGE PAUL & SON, Cheshunt, excelled with a grand exhibit. The fruit classes were well contested, and fruit of excellent quality was forthcoming. The class for a decorated table of fruit, consisting of eight dishes, in eight dis-

tinct kinds, black and white Grapes to count as distinct kinds, provided an excellent competition. JOHN BALFOUR, Esq., Moor Hall, Harlow (gr. Mr. A. Jefferies), and Lord HOWARD DE WALDEN were awarded equal 1st prizes. The Grapes shown by Mr. BALFOUR were very fine, as also were his other dishes. Lord HOWARD DE WALDEN's collection was decorated with Orchids, and these were considered by the judges to be of superior value to the Carnations employed by Mr. Jefferies, so that the points allowed for the value of the flowers compensated Mr. Vert for those he lost in fruit; the award caused some dissatisfaction. The Hon. MAURICE GLYN (gr. Mr. Bradley) was 3rd; this exhibitor had an almost perfect bunch of Black Hamburgh Grapes, weighing about 4½ lbs. and of very fine shape, the berries being intensely black. The Hon. MAURICE GLYN just managed to win the 1st prize in the class for two bunches of Black Hamburgh with very fine Grapes, Mr. BALFOUR following closely with massive bunches and large berries, but hardly so black as in the 1st prize exhibit. In the class for two bunches of any other Black Grape, Mr. BALFOUR won the 1st prize with two fine bunches of Madresfield Court; 2nd, Mr. BRADLEY. Mr. BALFOUR also excelled in the class for two bunches of Muscat of Alexandria, having heavy bunches with large berries; 2nd, Mr. GOODWIN BARNES. The exhibits of vegetables were very fine. In the class for 12 distinct kinds there were six competitors, Mr. BALFOUR, as in former years, proved invincible, staging fine Celery, Tomatos, Runner Beans, Leeks (which were fine in size and well blanched), and very large Onions; 2nd, Mr. HARDING, Sele Grange, Hertford; 3rd, Mr. BATES, Sele Lodge, Hertford. There were 20 table decorations. Miss NELLIE VERT won the 1st prize, Mrs. E. GULE, of Newport, the 2nd, and Miss ELSIE VERT the 3rd. Mr. R. F. Felton, who judged the decorative classes, gave a demonstration on arranging flowers.

BASINGSTOKE HORTICULTURAL.

AUGUST 7.—The annual summer show of this society was held in Golding's Park on the above date. The entries were more numerous than in recent years, a distinct improvement being apparent in not only the number but the quality of the exhibits. The best group of miscellaneous plants arranged for effect in a semi-circle was shown by S. E. BATES, Esq., Manydown Park, Basingstoke (gr. Mr. W. Green). Plants of Codiaums (Crotons), Palms, and Ferns, brightened by Orchids, Gloxinias, and other flowers, formed the main features. W. H. McCONNEL, Esq., Baughurst, Basingstoke (gr. Mr. G. Wassel), was awarded the 2nd prize. The exhibits in a class for specimen plants in or out of bloom in nine varieties made a bold display down the centre of the large marquee. H. WELCH THORNTON, Esq., Beaurepaire Park (gr. Mr. J. Keen), was placed 1st, his collection including fine plants of *Cycas revoluta*, *Stephanotis floribunda*, and *Allamanda Hendersonii*. 2nd, Mr. W. H. McCONNEL. The best single-flowering plant was shown by J. LIDDELL, Esq., Sherfield Manor, Basingstoke (gr. Mr. Leamouth), in a grand specimen of *Ixora Duffii*. Tuberous-rooted Begonias were of much better quality than usual at these exhibitions. For eight plants Mr. J. G. HOLT, Kingsclere (gr. Mr. F. Sweet), was placed 1st, the blossoms being numerous and fine. 2nd, Mr. L. DE L. SIMONDS, Audley Wood (gr. Mr. Dean). Coleuses were also shown grandly. Pyramidal-trained specimens 6 feet high and handsomely coloured were shown by Mr. BATES, who was awarded the 1st prize. Exotic Ferns exhibited luxuriant growth. Mr. H. WELCH THORNTON won in the class for six varieties with handsome specimens, *Nephrolepis elegantissimus*, *Adiantum elegans*, and a handsome *Dicksonia* being noteworthy examples. Lilliums and table plants were best shown by Mr. LIDDELL.

CUT FLOWERS.

Roses were neither numerous nor good. Mr. L. DE L. SIMONDS won the 1st prize in the class for 12 varieties, distinct. He also had the best exhibit of 12 distinct herbaceous flowers in bunches. Collections of hardy flowers arranged to fill a table space of 6 feet run were very numerous. Mr. L. DE L. SIMONDS was again the most successful exhibitor, having such kinds as Phloxes, Lilliums, Roses and Carnations. 2nd, W. BUCKLEY, Esq., Moundsmere (gr. Mr. G. Pettet).

Mr. J. LIDDELL secured the leading award for 12 bunches of cut flowers, distinct. *Ixora Duffii*, *Gloriosa superba*, *Liliums* and *Carnations* were all shown well. Sweet Peas were shown well considering the late season and the hot weather. The Hon. Mrs. F. BARING, Preston Candover (gr. Mr. A. Child), won the 1st prizes in two classes for a collection of six sorts each. This exhibitor also showed the best Cactus-flowered Dahlias and the best show Dahlias. Mr. LIDDELL was placed 1st for 12 varieties of *Carnations* in vases, making a pleasing display.

Fruit was shown excellently. For a collection of six kinds, Pineapples excluded, Mrs. LIDDELL was placed 1st with fine bunches of Madresfield Court and Muscat of Alexandria Grapes, good Peaches, Nectarines and Figs. Col. H. WALPOLE, Heckfield Place, Winchfield (gr. Mr. Gardner), followed closely. The best two bunches of Black Hamburgh Grapes were staged by Mr. W. H. McCONNEL. Mr. L. DE L. SIMONDS was placed 2nd with larger but less shapely bunches.

In the any other black Grape class both the 1st and 2nd prizes were awarded for Madresfield Court, Mr. BATES and Mr. LIDDELL winning in this order.

In the class for Muscat Grapes, Madresfield Court was again selected as the best variety; the exhibitor was Col. WALPOLE. 2nd, Mr. LIDDELL. Mr. BATES had the best scarlet-fleshed Melon in a handsome fruit of Sutton's Superlative. Mr. L. DE L. SIMONDS won the 1st prize in the class for a green-fleshed Melon with the variety Hero of Lockinge. Mrs. H. WELCH THORNTON excelled with Peaches, whilst Mr. LIDDELL showed the best Nectarines. The best dessert Apples were exhibited by Col. WALPOLE, while Mr. LIDDELL excelled in the class for a culinary variety. Lord CURZON, Hackwood Park (gr. Mr. West), was placed 1st for both Pears and Plums.

Vegetables are always a feature at this show. For a collection of eight kinds, Col. WALPOLE was placed 1st. In Messrs. Sutton & Sons' class for six varieties, Mrs. TREVOR GOFF, Sherfield (gr. Mr. H. E. Wallis), won the 1st prize with splendid produce. Mr. BERCKLEY won the 1st prize in Messrs. Toogood & Sons' class for six kinds. Messrs. B. LADHAMS & Co., Shirley and Southampton, staged an attractive non-competitive exhibit of herbaceous flowers, such as *Gaillardias*, *Lilies*, *Coreopsis*, *Phlox*, *Pinks* and *Carnations*.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

AUGUST 10.—Committee present: Rev. J. Crombleholme (in the Chair); and Messrs. R. Ashworth, C. Parker, Z. A. Ward, J. Evans, W. Holmes, A. J. Keeling, F. K. Sander, and H. Arthur (secretary).

Col. J. RUTHERFORD, M.P., Blackburn (gr. Mr. Lupton), staged a very fine group, for which a Silver Medal was awarded; the exhibit included several plants of *Cattleya Gaskelliana alba*, and a well-flowered specimen of the type, a good form of *Brasso-Cattleya Maronæ*, *Cattleya Warscewiczii*, *Lælio-Cattleya callistoglossa*, *Cypripedium Maudæ*, and several others.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), was also awarded a Silver Medal for an excellent group of *Cattleyas* and *Cypripediums*, including two good plants of *Cattleya Atalanta*, *Lælio-Cattleya callistoglossa*, a plant of *Cattleya Hardyana* × *Harrisonæ*, bearing two well-formed, bright flowers, several plants of *Cattleya Harrisonæ*, *Cypripedium* "Lord Derby," *C. Rothschildianum*, *C. Burtonii*, and *C. tixallense*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), staged an excellent group, for which a Silver Medal was awarded, *Miltonias* being a feature; *Cypripediums* were also good, *Odontoglossum crispum* × *xanthotes*, a very pretty *O. Harryanum*, and others; *Lælio-Cattleya Bletchleyensis* and the *Ashlands* var. of *C. Gaskelliana alba*, for which an Award of Merit was granted, *Bollea Lalindei* var. *coelestis*, which also received an Award of Merit, and *Cypripedium Godefroyæ leucochilum* var. *Perfection*, which received the same distinction.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), showed *Odontoglossum crispum* *Perfection* and *O. vexillarium superbum*.

MESSRS. CHARLESWORTH & Co., Haywards Heath, staged choice plants of *Odontoglossum Aireworth* (*Lambeauianum* × *crispum*), a form

of *O. crispum*, with an exceptionally large flat lip; *Sophro-Cattleya Marathon*, and *Cattleya Smilax*, of the *Charlesworthii* type.

MESSRS. KEELING & SONS, Bradford, staged an excellent form of *Cattleya Harrisonæ*, var. "Grand Duke," the flowers being of a good dark colour, and *Cattleya Vulcan*.

Mr. J. BIRCHENALL, Alderley Edge, showed several interesting plants, including *Stanhopea Rodigasiana*, *Bollea Lalindei*, *Anguloa Clowesii*, and a choice form of *Cypripedium bellatulum*.

AWARDS OF MERIT.

Cattleya Gaskelliana alba, *Ashlands* var., from R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), *Bollea Lalindei* var. *coelestis*, a flower of deep colour with bands of intense purple; *Cypripedium Godefroyæ leucochilum* var. *Perfection*, with ground colour of deep cream and regular markings, the petals being very broad, forming a good, round flower.

The next meeting will be held in the Coal Exchange, Manchester, on Thursday, September 14.

TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL.

AUGUST 10.—The above society held its 44th annual exhibition in the beautiful grounds of Vivary Park on this date. There was a smaller attendance compared with last year on account of other attractions in the locality, but the weather and the exhibition itself left nothing to be desired. The number of groups was greatly in excess of last year. Whilst specimen plants were about the same in number, displays of fruit were especially good, and the decorative classes were well contested.

MESSRS. J. CYPHER & Co., Cheltenham, were awarded the 1st prize for 12 stove and greenhouse plants in bloom, the 3rd prize being awarded to the Rev. P. B. LLOYD, Wellington.

MESSRS. CYPHER were also placed 1st in the class for six foliage and variegated plants, and for a group of miscellaneous plants arranged for effect in a space of 130 square feet. This group was composed of a central arch crowned by a fine *Kentia Palm*, and flanked with brightly-coloured *Codiaeums*, whilst underneath were arranged *Alocasias*, *Liliums*, *Codiaeums*, a number of *Orchids*, and bright foliage plants. Mr. C. J. ELLIS, Weston Nursery, Weston-super-Mare, who closely followed, had a bright and tastefully-arranged group. A fine specimen of *Areca lutescens* crowned the centre, and worked lightly in the group were brightly-coloured *Codiaeums*, *Amaranthuses*, *Eulalias*, and other graceful plants.

In the amateur classes the best group of plants was shown by Mr. H. CORNELIUS, Weston-super-Mare (gr. Mr. C. Cook).

Mrs. BERNARD, Bridgwater, was awarded the 1st prize for 12 stove and greenhouse plants; A. W. BROCK, Exeter, the 2nd; and B. C. SHEPPARD, Bridgwater, the 3rd.

Mr. H. CORNELIUS excelled in the class for six stove or greenhouse plants, whilst the best six table plants were shown by Sir W. H. DAVIES, Bristol.

For a collection of eight varieties of fruit H. ST. MAUR, Esq., Stover Park, Newton Abbot (gr. Mr. H. Richardson), was placed 1st; F. J. WINGFIELD DIGBY, Esq., Sherborne Castle (gr. Mr. T. Turton), being 2nd, and G. A. GIBBS, Esq., Tyntesfield, Bristol (gr. Mr. Wilkinson), 3rd.

Mr. DIGBY was awarded the 1st prize in the class for four dishes; 2nd, Mr. ST. MAUR.

Mr. J. WEBBER, Minehead, showed the best black Grapes.

In the class for a decorated table laid for dessert for eight persons, Sir W. H. DAVIES, Bristol, was awarded the 1st prize; F. J. COLE, Bath, the 2nd; and C. J. ELLIS, Weston-super-Mare, the 3rd. There was much comment on the judges' decisions: in the opinion of many persons the 3rd prize table was the best.

For a collection of vegetables Mrs. BERNARD, Bridgwater, was 1st; the Earl of DEVON, Powderham Castle, Exeter (gr. Mr. Bolton), being placed 2nd.

In Messrs. J. Carter & Co.'s class for vegetables. Mr. B. C. SHEPPARD, Bridgwater, was

the only exhibitor, and this exhibitor won 1st prize in Messrs. Sutton & Sons, Messrs. Edward Webb & Sons, and Messrs. Robert Veitch & Son's classes.

Trade exhibits were not so numerous as in some former years. Messrs. ROBT. VEITCH & SON, Exeter, arranged a very attractive stand of Alpine and hardy herbaceous plants; Messrs. BLACKMORE & LANGDON, Bath, exhibited a superb collection of *Begonias*; Messrs. KELWAY & SON, Langport, showed *Gladioli* in great variety; Mr. VINCENT SLADE, Taunton, staged a fine collection of *Pelargoniums*; and Messrs. YOUNG & Co., Cheltenham, had a fine exhibit of *Carnations*.

ABERDEEN AND NORTHERN COUNTIES SWEET PEA.

AUGUST 11, 12.—The first exhibition of the above society was held on these dates, in beautiful weather, in the ball-room of the Music Hall Buildings, Aberdeen. There was a large number of entries. Sir Thomas Burnett, Bart., of Leys, Crathes Castle, performed the opening ceremony; Mr. M. H. Sinclair, Aberdeen, carried out the secretarial duties, the arrangements made being all that could be desired. The proceeds of the show were handed over to the Building Fund of the Aberdeen Royal Hospital for Sick Children.

In the class for 12 varieties with waved standards, the leading prize, a handsome silver Rose bowl, was awarded to Mrs. DUNBAR DUNBAR, Seapark, Forres (gr. Mr. John A. Grigor). The flowers were splendid and unquestionably the finest ever seen in Aberdeen. The best variety was Charles Foster, and there were also choice examples of *Edrom Beauty*, *Etta Dyke* (pure white), *Masterpiece* (lavender), *Earl Spencer*, *Unique*, and *Shrimp* (pink). 2nd, Sir THOMAS BURNETT, Bart., Leys, Crathes Castle (gr. Mr. John Petrie), for a very fine group, the outstanding specimens in which were *Etta Dyke*, *Evelyn Hemus*, *Elsie Herbert*, and *Paradise Ivory*. Mrs. DAVIDSON, Dess House, Aberdeenshire (gr. Mr. J. Ingram), was placed 3rd.

The best six vases of Sweet Peas with waved standards were also shown by Mrs. DUNBAR DUNBAR, Seapark. Clara Curtis, Mrs. W. J. Unwin, Asta Ohn, Money-maker, Princess Victoria, and John Ingman were outstanding varieties. Mr. A. M. WILLIAMSON, Monbroddo House, For-down, N.B. (gr. Mr. James Tullo), was a good 2nd.

In the class for three vases with waved standards, Mr. A. M. WILLIAMSON won both the 1st and 2nd prizes, his varieties including *Etta Dyke*, *Tennant Spencer*, and *King Edward Spencer*.

In the competition for three bunches of novelties of 1910 and 1911, Mrs. DUNBAR DUNBAR, of Seapark, worthily won the 1st prize. Thus this lady, with four entries, secured three 1st prizes and the leading prize of the show—the silver Rose bowl. Mr. ALEX. GRIGOR, Duff House, Banffshire, was placed 2nd; and Mr. A. M. WILLIAMSON 3rd.

The best bunch of lavender Sweet Peas was also shown by Mrs. DUNBAR DUNBAR, and she was closely followed by Mr. A. M. GORDON, Newton House, Inch, Aberdeenshire (gr. Mr. William Cameron), and Sir VICTOR MACKENZIE, Bart., Brackley House, Ballater, Aberdeenshire (gr. Mr. R. Gibson).

For one bunch of Sweet Peas, Mrs. DAVIDSON, Mr. A. M. WILLIAMSON, and Sir THOMAS BURNETT, Bart., were awarded the prizes in this order.

Mr. WILLIAMSON, Mrs. DUNBAR DUNBAR, and Sir VICTOR MACKENZIE were the most successful exhibitors in the class for Picotee-edged varieties of Sweet Peas.

Leading exhibitors in the amateurs' classes were:—Mr. R. M. WILLIAMSON, Rubislaw Den, Aberdeen; Mrs. EDWARDS, Buch Hill House, Aberdeen; Mr. JAMES MITCHELL, 3, Arbedie Terrace, Banchory; Mr. G. RHIND, 42, Gordon Street, Huntly; Mrs. MITCHELL, Sluivannachie, Ballater; Mrs. W. CORMACK, Dyce, Aberdeenshire; and Mr. WOOD, 64, Hilton Place, Aberdeen.

The best dinner-table decoration of Sweet Peas, on a space 6 feet by 4 feet, set for six

persons, was arranged by Mrs. PORTER, Monaltrie, Ballater. An elegant silver epergne formed the centrepiece, and this was flanked with four small vases, all showing the choicest of blooms; the effect was charmingly beautiful. 2nd, Mrs. MILNE, 357, Hardgate, Aberdeen. Bowls of Sweet Peas formed a very fine feature, and called forth many hearty encomiums. Mrs. EDWARD, Restalrig, Culter, Aberdeenshire, carried off the 1st and 2nd prizes with superb entries.

NORTH OF ENGLAND HORTICULTURAL.

AUGUST 15.—The meeting of the North of England Horticultural Society, held at Harrogate, on this date, in conjunction with the show of the Harrogate Agricultural Society, proved a great success. The weather was delightful, and the tents were not excessively warm, owing to a cool north-east breeze. A deputation of the Royal Horticultural Society made grants of Cups and Medals to certain of the more important exhibits; the National Hardy Plant Society conferred Awards to hardy plants; and the Northern Society gave many Medals to exhibits and several Diplomas to novelties.

J. BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. J. W. Hathaway), exhibited an exceptionally fine collection of fruit and vegetables, for which the Silver Cup offered by Lord Faber and the Royal Horticultural Society's Silver Hogg Medal were awarded.

Silver Cups were awarded by the R.H.S. deputation as follow:—Silver-gilt Banksian Medals to Messrs. MANSELL & HATCHER, Rawdon, for Orchids; GIBSON & Co., Bedale, for herbaceous plants; DOBBIE & Co., Edinburgh, for choice Roses and Gladioli; BACKHOUSE & SON, York, for Apples and hardy herbaceous plants; and KELWAY & SON, Langport, for Gladioli. R.H.S. Bronze Flora Medals were awarded to Messrs. KEELING & SON, Bradford, for Orchids; DICKSON & ROBINSON, Manchester, for a collection of Phloxes and other border plants; A. H. RIGG, Shipley, for Roses; and W. H. BONSALE, Harrogate, for Carnations and greenhouse plants. R.H.S. Banksian Medals were awarded to Messrs. JARMAN, Ripon, for Sweet Peas and Dahlias. A Silver Knightian Medal was awarded to W. W. CLIFFE, Esq., Leeds (gr. Mr. W. Hague), for a small but excellent exhibit of well-grown fruits. Silver Flora Medals were awarded to Messrs. E. T. LOW, Haywards Heath, for Orchids; W. LAWRENCE, Yarm-on-Tees, for Carnations and Phloxes; C. T. WATERS, Balcombe, for Carnations; R. P. KER & SONS, Liverpool, for stove and greenhouse plants; T. G. BELL, Whitley Bay, for Sweet Peas and Violas; and W. & J. BROWN, Peterborough, for Roses. Silver Banksian Medals were awarded to Messrs. S. BAILY, Knaresborough, for Sweet Peas; YOUNG & Co., Cheltenham, for Carnations; W. CONWAY & SONS, for hardy flowers; MACK & MILN, Darlington, for Roses and herbaceous flowers; A. J. HALL, for Coleuses and Fuchsias; and MAWSON BROS., Windermere, for hardy herbaceous flowers. A Cultural Commendation was awarded to W. S. HANNAN, Esq., for fine fruits of Peaches; and a Certificate of Appreciation to the BRITISH BOTANICAL ASSOCIATION for an educational exhibit.

The delegates of the National Hardy Plant Society made the following Awards:—Silver-gilt Coronation Medal and a Gold Medal offered for a circular bed of hardy plants, to demonstrate their value for bedding, to Messrs. G. GIBSON & Co., Bedale. The bed comprised a groundwork of Phloxes, with Hyacinthus candicans as dot plants, and an edging of Nepeta mussina.

The North of England Horticultural Society made the following Awards to novelties:—First-class Diplomas to Gladioli Langport Blue and Golden Measure, both shown by Messrs. KELWAY & SON; Gladioli La Triomphe, shown by Messrs. R. HARKNESS & Co., Bedale; and Rudbeckia purpurea Gibson's variety, shown by Messrs. G. GIBSON & Co., Bedale.

Second-class Diplomas to Gladioli Miss Wilkinson and Brooklands, both shown by Messrs. KELWAY & SON; Verbascum Caledonia, shown by Messrs. G. GIBSON & Co.; a seedling Melon, shown by J. BRENNAND, Esq.; a seedling Tomato, shown by Messrs. E. BATCHELOR; Cattleya Atalanta superba and Cœlogyne asperata, these two Orchids shown by Messrs. MANSELL & HATCHER.

Obituary.

JEREMIAH GALBRAITH.—Jeremiah Galbraith, for more than 50 years a landscape gardener of New Rochelle, New York, U.S.A., died on July 23, at his home, 15, Cedar Street. Deceased, who was 76 years of age, emigrated to America from Ireland when he was 26 years old. *Florists' Exchange.*

ENQUIRY.

ALBINISM IN SWEET PEAS.—We have had from various parts of the country and from India from time to time reports from customers that the flowers of their Sweet Peas of whatever variety are in their gardens always white. We have one example in this neighbourhood so remarkable that the garden is called the "white garden," but so far as our memory goes this is only applied to Sweet Peas. Have any readers heard of such cases? *R., St. Albans.*

ANSWERS TO CORRESPONDENTS.

CULTIVATION OF YAMS: *G. G.* Of the large number of Yams in cultivation in the tropics, the best are *Dioscorea alata* and *D. sativa* and their numerous varieties. The former is known as the winged-stalked Yam; its tubers are often several feet long and as much as 60 lbs. to 80 lbs. in weight. *D. sativa* is the common Yam of the tropics, and, being of easier culture than the preceding, also much more readily propagated from the stem tubers, which are produced in numbers along the upper parts of the stems, is the more suitable for your purpose. The tubers of both species are excellent either roasted or boiled. Being natives of the tropics, they require a warm, sunny house for their cultivation. The other plant you mention is the Chinese Yam, *D. batatas*, a native of China and Japan, in which countries it is largely grown. It differs from the other species mentioned in having a tapering black root, as large as a Parsnip. The plant is quite hardy in this country, and has been tried as a substitute for the Potato, but in edible properties it is inferior to that vegetable.

EMPLOYMENT AT KEW GARDENS: *C. P. F. K.* See answer to *H. H.* in issue for August 12, p. 120. The address of the John Innes Institution is Merton, Surrey.

NAMES OF PLANTS: *H. M.* 1, *Eupatorium Wiennmannianum*; 2, *Diplacus glutinosus*; 3, *Origanum hybridum*; 4, *Isoloma hirsuta*; 5, *Rhamnus catharticus*; 6, *Chimonanthus fragrans*; 7, *Geranium sanguineum*; 8, *Buphthalmum speciosum*; 9, *Linaria Cymbalaria*; 10, *Achillea pyrenaica*; 11, *A. millefolium roseum*; 12, *Saponaria officinalis* fl. pl.—*R. T.* 1, *Selaginella Wildenovii*; 2, *Blechnum corcovadense*; 3, *Pteris geraniifolia*; 4, *Adiantum hispidulum*.—*A. M. S.* *Dendrobium chrysanthum*.—*T. V.* The *Cypripedium* is evidently a cross between *C. Rothschildianum* and *C. Charlesworthii*.—*T. B. R.* 1, Apparently Cardinal; 2, probably a seedling fancy Carnation, but of no value; 3, a fancy red-flake Carnation, probably a seedling; 4, a seedling rose self; 5 and 6 are crimson selfs, not good enough to name.

PEACHES: *F. H.* The Peaches decayed at their centres have been received and examined, and, as we suspected, there is no fungus present. The trouble is probably due to an excess of moisture at the roots.

PEAR LEAVES FOR EXAMINATION: *O. S. R.* The Pear leaves have been very severely attacked by the larvae of the Pear-leaf Blister Moth, *Cemistoma scitella*. It is too late to apply remedial measures this season. Spray the leaves another season during April with arsenate of lead paste, making the spray as fine as possible.

RAISING NYMPHÆAS FROM SEED: *E. H. W.* The present season should prove a most propitious one for securing seeds of almost all Nymphæas. First, select the most promising seed vessels, but allow them to remain on the plants for the present. Mark them by means of a stick, or better, with two

sticks, one on either side of the stem, but do not tie the seed pod to the sticks, these merely keep it in position and indicate its location. Two seed pods are sufficient for one plant to mature considering that it is still flowering. Remove all other seed pods as they form. Watch closely for the bursting of the capsules, which will soon take place. When this occurs the seeds float for about 24 hours, then sink and settle upon the muddy surface; where, if the conditions are favourable, they will germinate. It is better, however, to skim off the seeds whilst they are floating. These, when collected, should be sown at once in shallow pans in mud with a slight covering of water. Place the pans in a temperate house and keep them there until the seedlings appear. Then thin them out, when large enough, a few at a time, and prick these off into another pan in about 2 inches of mud: not stale mud that smells, but such as is obtained by using loam and clay. When the seeds are left to themselves they usually float to the sides of a pond or tank and can easily be secured. If the water be quite shallow at the margin this will be a congenial place for the seed to germinate in a natural manner, and in such places the seedlings should be looked for next season. There is, of course, the possibility of loss from water slugs or snails, which are apt to destroy the plants. Seedling Nymphæas will flower in twelve months if they are attended to carefully.

SEEDLING CARNATION: *J. Dunlop.* There is no other similar Carnation on the market. You are at liberty to give it any name you like; the colour is distinct and good, but the calyxes burst badly, and the variety would be unlikely to procure a certificate from any Carnation or floral society.

SIBTHORPIA ODORATA: *H. R. Holland.* This name has not been recorded in any standard work, nor can any plant of this name be traced. There are three species of *Sibthorpia* in cultivation: *S. europæa*, *S. peregrina*, and *S. africana*. Only the first-named is hardy; the others need the protection of a frame from which frost may be excluded during the winter. Probably the plant you have named *S. odorata* belongs to one of these three species. Send us a specimen of the plant for identification.

SWEET PEAS: *J. M. B., Crawley.* There is no specific disease or insect pest in the Sweet Pea stems. The trouble is probably a "physiological" one, such as frequently occurs in this plant. It is possible, however, that the cause of the yellowing is a disease of the root; send us, if possible, the whole of the root of an affected plant.

TOMATO CRACKING: *A. M., Londonderry.* The cracking and "rot" of the Tomato sent is not due primarily to any fungous disease. The bursting of the skin is probably caused by over feeding the plant; various "moulds," chiefly *Penicillium glaucum*, have attacked the fruits after they have cracked.

TRIPLE-PODDED PEA: *W. G. H.* The photograph of a triple-podded Pea which has appeared amongst a special stock of a new first early variety is interesting. Many years ago Messrs. Vilmorin, of Paris, offered a triple-podded sickle Pea. Efforts were made to improve it by selection and crossing by Mr. Hugh Dickson, of Newtownards, and others. Messrs. Hurst & Son are still working at it, and have now a number of selections, some giving pods as large as Alderman. The trouble is to obtain a stock which will produce three pods persistently.

TWELVE ROSES FOR POT CULTURE: *E. T.* The following twelve varieties of Roses may be recommended for pot culture, and their blooms will provide a wide range of colour:—Niphetos, Richmond, Liberty, Mrs. Aaron Ward, Catherine Mermet, Bridesmaid, Perle des Jardins, Lady Hillingdon, Sunrise, Sunset, White Killarney, and Kaiserin A. Victoria. These are all largely grown. You can procure them in pots from any Rose grower.

THE PRUNING OF RAMBLING ROSES.

IT is now time to begin the pruning of Rambling Roses, that is to say, the varieties belonging to the Multiflora group, and the Wichuraianas. This pruning can be proceeded with during the autumn, and even down to the end of January, but any pruning which is done later than January may cause serious damage to the buds.

It is well to begin with the Multiflora group—Crimson Rambler, Blush Rambler and other similar Roses which I shall mention later on—because these varieties do not flower again the same season, whereas many of the Wichuraiana group do give us a few intermittent flowers in the autumn, and in a year like the present we may expect a full share of these occasional flowers.

These two groups of Roses are alike in one particular; their summer flowers are produced on short, lateral growths from the strong shoots of the previous summer. These strong shoots which are to carry the flowering laterals in the succeeding season are either thrown up from the base or produced from the old stems of the previous summer, in which case (to make use of the convenient description introduced, I think, by Dr. A. H. Williams) they are called "continuing laterals" to

distinguish them from the numerous, short-flowering laterals, which are of no further use.

The Multiflora group differs from the Wichuraianas in having thicker stems of more upright growth, the natural tendency of the Wichuraiana Rose being to push out its basal shoots, creeping along the ground in all directions. These creeping stems, if left to themselves, would doubtless make roots and form fresh plants, so that in no great length of time a large area would be carpeted with the low growth of the Rose. In ordinary gardens this could not be permitted, and the creeping growths have to be trained up or outwards, according to the purpose for which the Rose is grown, and from the extreme suppleness of the growths training may be carried out to any extent in any desired direction. The stiffer growth of the Multiflora Rose does not permit this treatment to the same extent, and an attempt to bend it down or wind it round a pillar, often a convenient way of treating a Wichuraiana Rose, would frequently result in breakage of the shoot. The natural growth of the Multiflora Rose, left to its own devices, would be to form a tall, arching bush, gradually becoming a dense thicket, from which every year the strong basal shoots and continuing laterals would be pushed upwards, bending down with the weight of blossom of another summer; these in their turn would be overtopped by the strong young shoots of a new season's growth.

From the gardener's point of view there is another distinction between the Multiflora and Wichuraiana groups, and that is that in the Multifloras the old wood that has produced laterals and flowered is practically useless for garden purposes again, except as a carrier for strong continuing laterals. This is not quite the case with the Wichuraianas, for though with them also the best-formed and longest-stemmed flowers will be produced from the young wood, yet the old wood may, if required to fill a gap, be retained, merely cutting back the laterals to a few eyes, which will produce new laterals to give flowers in the succeeding summer; this plan is not, however, to be recommended if it can be avoided, as the flowers will not be so fine, nor will they be carried on such long stems as those from the strong, young growths. This, however, is quite distinct from the retention of old wood on either Multiflora or Wichuraianas, merely as a carrier for continuing laterals, a process which is often convenient.

Commencing then with the Multiflora Roses, the first operation is to take down the plant from the arch or pergola on which it is growing and lay it out, carefully preserving all the young basal shoots. If the Rose is grown as a pillar, and a fair amount of basal shoots have started, the rest of the plant may be cut away, leaving these to grow. When this course is adopted no apprehension need be felt that the base will be flowerless, for these young shoots will flower readily to the ground, but later on, if desired and the shoots are many, some

may be headed down to different heights so as to increase the furniture of the base of the plant.

If, however, the Rose is grown on a pergola or high wall or screen, the basal shoots may not be tall enough to cover or reach to some parts which the Rose is expected to cover; or it may be the number of basal shoots produced have been insufficient to furnish the plant, in any of these cases we must call in the assistance of the continuing laterals.

Select then as many of these as are considered to be necessary and cut off all the parts of the old stem above the starting point of the young lateral to be retained, also trim off everything not wanted below this lateral, bearing in mind that the old stem has done its work as a flowering subject and remains merely as a carrier for the young lateral.

When the pruning is done in August or early in September, it must be remembered that the shoots will continue to grow for some months, and no doubt by delaying pruning until autumn or early winter it is easier to see exactly what there is to deal with, and the growths may be tied exactly into the positions they are to occupy next summer, but the early pruning has in its favour that the young growths get more thoroughly ripened, and should any of them have proved too vigorous and to have grown beyond the limit assigned to them, their tops can readily be reduced at a later period when growth is ceasing.

The Roses to be treated, as included in the Multiflora group for pruning purposes, are the true Ramblers, Aglaia, Ariel, Blush Rambler, Crimson Rambler, Evangeline, Excelsa, Flora, Helène, Laure Davoust, Leuchtstern, Psyche, Philadelphia Rambler, Tausendschön, and, in addition to these, Tea Rambler, which really belongs to the same class, though sometimes called a Tea, and the Hybrid Musk Roses, The Garland and Mme. D'Arblay.

Turning now to the Wichuraianas, there are four classes for pruning purposes:—(1) Roses of the Dorothy Perkins type which produce a quantity of basal shoots, and also continuing laterals like the Multifloras; (2) Albéric Barbier and similar Roses, producing few basal shoots but plenty of new growth on continuing laterals; (3) Roses making strong upright growth like Gerbe Rose; (4) Messrs. Paul & Son's new race of Wichuraiana Teas.

(1) The first group includes Dorothy Perkins and its sports Minnehaha, Lady Godiva and White Dorothy, also Lady Gay, Paul Transon, François Juranville, and the majority of the hybrid Wichuraianas, and, without entering into the controversy whether Hiawatha is or is not a Wichuraiana, certainly for pruning purposes it should be regarded as belonging to this group and class.

The method of pruning will follow generally that system recommended for the Multifloras with this exception, viz., that it will not be taken in hand until hope of autumn flowers has been abandoned, and, if it be thought necessary, a few of the old stems may be kept for flowering purposes. This latter plan, however, should

not be adopted where the growth has been weakly. With weakly plants it is, I think, best to cut the old wood out altogether, relying entirely on young growths, and this should be done early in autumn, so as to allow full time for ripening the new growth.

(2) The second class includes Albéric Barbier, Gardenia, François Foucard, Elisa Robichon, Jersey Beauty, and a few other varieties. Here the basal shoots are not as a rule numerous, and continuing laterals must perforce be relied upon. Much thinning out of old wood will be required, and, as a rule, the old wood above the starting point of the continuing laterals should be cut away, but the absolute removal of all wood that has flowered is not so imperative as in the Dorothy Perkins class.

I have found that there is no great difficulty when it is considered desirable to induce this class to act exactly like the Dorothy Perkins or basal shoot-making class. The process is, when pruning in autumn, merely to tie the growths up temporarily, and in the early spring, before growth commences, take them down carefully and peg them down flat for a time until growth is in full swing, then tie up carefully again, and in the summer a number of basal shoots will be found wherewith to renew the life of the tree.

(3) Of the sturdy, upright-growing Wichuraianas two only are known to me, Gerbe Rose and Diabolo. Gerbe Rose always has a few autumn flowers, and I generally wait till these are over and then cut out the old growths, leaving the beautiful, shiny foliage of the young growths to ripen. Though I prefer to prune this class in the autumn, I think that there is in this case no special reason, as there is in the case of the climbing varieties, why the pruning should not be deferred till spring if desired.

(4) Of the dwarf Wichuraiana Teas I need say little. They seem rather tender, and so I have deferred pruning till April. Little is required beyond shortening the tips and cutting out frost-damaged wood. *White Rose*.

PLANT NOTE.

IMPATIENS ROYLEI.

This Himalayan Balsam is a very accommodating plant. I have seen it growing strong in the swampy sides of a wooded stream, whence it had escaped from a cottage garden and become naturalised. In these conditions of ample moisture and a rich soil the shoots were succulent, and so brittle that a sudden puff of wind would break them. Here the plants had become drawn up 6, or more, feet high, but, as always, the race was to the strong, and although quantities of self-sown seed germinated every spring yet the crowd of seedlings soon resolved itself into groups of branched plants with plenty of flowers. Recently, I have seen plants 5 feet high, and full of flower, growing amongst tall shrubs on a bank which only receives water when rains fall. It would be difficult to find conditions more opposite, and yet in each case the plant thrives and flowers freely. It is such instances as this which makes one pause before dogmatically stating that certain conditions are essential to the welfare of particular plants. *A. O. Bartlett.*

WOOD HALL, SYDENHAM.

SYDENHAM Hill is one of the few remaining spots of greenery in the densely-populated district of south-east London. Dulwich, Streatham, Norwood, Anerley, Penge, and Forest Hill surround it, but, thanks to the charitable intentions of Edward Alleyn, an Elizabethan actor and "chief master over games of beares, bulls and mastive doggs" to King James I., who founded Dulwich College, which nestles at the foot of the hill, Sydenham Hill itself still retains a large part of its original woodland. On an edge of the wood, in one of the most-favoured sites, lies Wood Hall, the residence of J. C. Eno, Esq. Mr. R. B. Leech, who has been gardener at Wood Hall for a period of 27 years and to whose initiative the garden owes its principal features, modestly declares that the attraction of the garden lies not in what it has but in what it overlooks. It would be idle to deny the value of the magnificent prospect from the terrace—which is 350 feet above sea-level and only 5½ miles from Charing Cross—over the whole of London and into Essex, Middlesex, Buckinghamshire, and, in clear

The garden is situated on the London clay, and contains many examples of plants that may be cultivated in this unpromising medium. *Funkias*, *Polygonatums*, and the double-flowered variety of *Gypsophila paniculata* revel in the heavy soil, whilst *Roses* and *Pæonies* (see fig. 65) succeed especially well. Very few conifers have been planted, for the district is visited by dense fogs, which are so harmful to most evergreens. There is a good specimen of the deciduous Cypress (*Taxodium distichum*), but for shelter the garden relies on the natural woodland and banks of *Rhododendrons*. Japanese Maples and Bamboos both succeed well, the collection of the latter including a beautiful plant of *Arundinaria nitida*. *Buddleias* also grow well in this garden, the vigour of the annual growths and inflorescences being increased by pruning the plants to the ground level each year. Carnations are planted out annually in considerable numbers, but with the exception of one home-raised, seedling border variety, which combines the merits of good scent, fine calyx, a free-flowering habit and brilliant scarlet flower, only the perpetual-flowering varieties are now employed. A bed of Carnation

FIG. 65.—RHODODENDRONS IN FLOWER AT WOOD HALL, SYDENHAM.

[Photograph by John Gregory.]

weather, Berkshire. But the garden itself is full of interest. A few summer-bedding plants, such as *Celosias*, *Calceolarias*, and *Begonias*, brighten the borders in summer, but in principle the bedding-out system has been abandoned and broader effects are aimed at by the informal arrangement of hardy subjects and by wild gardening with bulbs, Ferns, and *Rhododendrons* at the fringe of the wood. The most recent improvement is a partial clearance of Oak to allow sufficient light to reach a group of Himalayan *Rhododendrons* and the development of a small valley where moisture settles, forming a suitable home for species of *Primula*. The *Rhododendrons* seen in fig. 65 are specimens of *R. Broughtonianum*. There is no peat in the soil, and Mr. Leech is of the opinion that good loam, with an admixture of leaf-mould and well-rotted manure, is a better rooting medium for *Rhododendrons* than peat. The plants are in excellent health in spite of the unprecedented drought of the present season, and a bed of *R. arboreum* *Wellsianum* gives particular promise of producing a fine display next spring.

Enchantress, edged with *Verbena* Miss Willmott, may be expected to furnish a beautiful display of flowers until the arrival of autumn frosts. Near the dwelling-house are unusually fine specimens of *Wistaria multijuga* and its variety *alba*, which flower annually with extraordinary profusion, and this year have set a quantity of seed. A plant of *Actinidia chinensis* against an arch in a wall is growing with greater vigour than any of the hardy vines, making annual growths 12 feet in length and an inch in diameter. Cuttings of this plant root readily in spring.

The kitchen garden and glasshouses are arranged compactly in a sheltered corner to the south-west of the grounds, and they have a southern aspect. Trenching and manuring annually have made the ground amenable enough now, but for many years Mr. Leech found it impossible to transplant *Asparagus* successfully. The crops of Pears and Plums are failures this year, and Apples are giving only a moderate crop. Currant bushes in this garden are quite free from "big bud," and Mr. Leech relates an interesting experience in this connection. For many years

the bushes were badly infested with the mite, but it was noticed that in a batch of two dozen purchased plants of Boskoop Giant one bush remained immune, although all the others were attacked. Propagation from this particular plant has produced a race of plants which has superseded all the other varieties cultivated in the garden, and continues to remain immune from attack.

With the exception of a fine tree of Nectarine Milton, which annually produces a fine crop of fruit with never failing regularity, the Peaches and Nectarines are trained as fans at right angles to the pathway. Although the increased light admitted by this system is welcomed and utilized to grow a few miscellaneous plants, it is thought that the Peaches do not colour and

moister atmosphere, they are, nevertheless, superior in flavour, colour and keeping qualities, the bunches lasting till well into May. There is a standing reward of twenty shillings for the first mealy bug discovered in the vineries. The roots of the vines are out-of-doors, except in the case of the early-fruited varieties.

Collections of Cattleyas, Odontoglossums, Cypripediums, and Dendrobiums are grown, and there are some especially good Thunias, but at the time of my visit few Orchids were in flower. Dendrobium Wardianum is found to do best in the Peach house, strong and well ripened growths being thus obtained. The small stove contains a fine climber in each of the three sections; these are Combretum purpureum, Allemanda grandiflora, and Dipladenia amabilis. The Dipladenia

feet are produced on plants in 24-size pots. The variety has been named pendula, but it does not come true from seed. Other interesting plants are a very compact form of Grevillea robusta, and a collection of Lapageria seedlings. Ceropegia Woodii is a favourite. Of Begonias, Miss Alice Manners, though an old variety, is still found the best for growing in hanging baskets. Schizanthuses are a feature in the conservatory in their season (see figs. 66 and 69). The specimen shown measured nearly 4 feet in diameter. The seeds were sown early in September, and the seedlings pricked out into small pots and repotted according to their needs until, about the middle of February, they were ready for planting in the hanging baskets. They were grown in cool conditions throughout the winter. E. J. W.

NOTICES OF BOOKS.

THE GLADIOLUS.*

GLADIOLUS culture in America has reached an importance which it has not yet assumed in Britain. Hundreds of acres of land are employed in the culture of the flower for market purposes and for the production of corms for home and export trade. The present book is written from the standpoint of the commercial grower, but many of the instructions given are of use to the smallest cultivator.

Two writers are responsible for the text, the major portion being from the pen of Mr. Matthew Crawford, whilst an appendix of some 30 pages is written by Dr. W. Van Fleet. Both writers deal with the history of the plant—an unnecessary duplication. Dr. Fleet's treatment of the subject is the more thorough.

April and May are the months recommended for planting. The soil is to be well cultivated in the autumn, and whatever fresh manure is used must be applied then, a very wise recommendation. As to artificial manure, Mr. Crawford has found most satisfactory results with a good Potato fertiliser, containing plenty of phosphates. He remarks, "the Gladiolus is a sturdy grower, able to assimilate a generous supply of nutriment, and should be properly fed."

Planting the corms 6 inches deep is recommended, both in field and garden, to prevent the plants blowing over when in bloom. In addition to this deep planting, ridging up the rows is also recommended as the plants are coming into bloom. It would be interesting to see this practised; probably it could only be carried out successfully in very free, loamy soil. Chapters are devoted to "Digging and Curing," "Cleaning and Grading," "Growing for Specific Purposes," and other valuable and interesting phases of Gladiolus culture. The cutting and shipping of the flowers for market is a most important part of the work in America, where the distances they have to travel are often very great. Mr. Crawford tells of a consignment arriving satisfactorily after a journey of 2,000 miles!

The chapters on propagation are excellent—raising plants from seed and bulblets. Success with the Gladiolus, we are told, "depends more upon the use and management of the bulblets than upon any other thing."

Bulblets grow from the base of the bulbs, are usually attached by stems, and have hard shells—too hard, sometimes, for the young sprout to get through. Some varieties produce bulblets very sparingly; others again develop them in great abundance.

Dr. Van Fleet contributes a valuable chapter on hybridisation. Altogether the work is of first-class importance, and a copy should be on every florist's bookshelf. It contains a number of good illustrations, all the more valuable because they are not in the least overdone. C.

FIG. 66.—SCHIZANTHUS CULTIVATED AS A BASKET-PLANT AT WOOD HALL, SYDENHAM.

finish so well as those grown under the more popular system.

The vineries also are of special interest as examples of an unusual method of culture. Mr. Leech endeavours to imitate in his houses the climate in which the vine flourishes best out of doors. He allows a maximum of sunlight and air and never damps the interior of the vineries nor applies moisture with the syringe. A much greater demand is thus made on the root system to meet the increased transpiration of moisture by the leaves and an increased quantity of dissolved food materials and salts is thus carried into the plant. It is claimed that the plants are healthier than most vines, and that, if the Grapes are not so large as those grown in a

fills one side of a 12-foot house and it presented a wonderful sight. It continues in flower throughout the summer, and at one time more than 100 of the large, rose and pink-coloured flowers are expanded together. The houses also contain collections of seedlings of Anthurium Scherzerianum, and of the newer types of Nephrolepis. As a basket plant, however, N. Fosteri, with pendulous fronds 5 feet long, remains a favourite.

Perhaps the most valued plant under glass is a remarkable seedling from Asparagus Sprengeri, which, planted out in a border, has growths which reach the roof and hang down again in long streamers. One of these growths has measured 26 feet in length, and growths of 7 and 8

TREE PRUNING IN THE MALL.*

ADVERSE criticisms having been forthcoming from time to time respecting the manner in which the trees in the Mall (London) have been pruned, the Government requested Professor Balfour, Regius Keeper of the Royal Botanic Garden, Edinburgh, to furnish a report upon the treatment the trees have received. As this broad avenue forms the main approach to the nation's monument to Queen Victoria, the treatment of the trees has a national interest. It will be noted that Professor Balfour not only approves the treatment the trees have received at the hands of those responsible for the management of the Royal Parks, but he describes the specimens as patterns of what street trees should be. The following is the text of the report:—

I have examined the young trees in the Mall.

I wish to say at once that I find nothing to warrant adverse criticism of the pruning of them, or of the result that has been obtained by it. On the contrary, I have been impressed by the evidence of the application of sound, practical knowledge, combined with scientific principle, in the pruning of the trees in relation to their environmental conditions. That four unbroken lines of shapely, symmetric, healthy trees of the size they have now attained have been established in the Mall, is a tribute to the skill with which they have been handled.

I cannot subscribe to the criticism that the trees have been over-pruned. I see no immediate evidence of over-pruning in the present condition of the trees nor suggestion of it in their promise for the future. Every tree I examined was in robust health, bearing a profusion of young twigs covered with plump, bursting buds, and the leafage which will shortly clothe the trees will, I do not doubt, tell its tale in confirmation of the vigour of the trees.

The Plane tree in youth naturally develops an exuberance of primary lateral branches on its stem, and there is a contest for leadership amongst them at the top. No one of these branches continues its growth by a terminal bud—a feature of other trees also—Lime, Elm, for instance. Arrest and self-pruning of the tip takes place, and the elongation of the shoots proceeds from lateral buds nearer to, or further from, the primary tip. The continuation bud may be the one immediately behind the point of abscission of the shoot tip, but often the shoot dies back to some distance behind the normal abscission line of self-pruning, and thus the elongation of a shoot in any one season is no measure of the permanent addition in length that is to be made to the axis, whether terminal or lateral, of which it is a part, for only the base of the annual growth may survive. If the tree grows freely without natural or artificial curtailment and discipline a relatively heavy brushhead is formed of intricate zig-zag branches of which the terminations may—many of them—be dead. In consequence:—

1. The surface exposed to air currents is large, and by so much increases the risk of overturn and of damage by rending in open situations.
2. Many of the primary branches do not survive in whole or in part the struggle for air and light with their fellows, and become, therefore, an encumbrance through their interference with the development and leafage of the branches that are ultimately successful, and they may be even a danger to the tree as starting points for disease.
3. The upward growth of the whole tree is retarded through the demand made by the surplussage of lower branches, and there is apt to be forking and division of the main trunk.

In rich soil these features are naturally exaggerated, and along with this goes this

* Report by Professor I. Bayley Balfour, F.R.S., Regius Keeper of the Royal Botanic Garden, Edinburgh, on Tree Pruning; presented to both Houses of Parliament by Command of His Majesty.

further character, that the wood which is formed is less resistant to lateral strain, and is, therefore, more liable to damage by breaking.

The art of pruning takes into account all these characters in each individual tree in relation to the conditions both below ground and above ground in which it grows, and I say without qualification that the trees in the Mall are a

- (b) Planted as isolated specimens in line to form an avenue the trees are individually exposed in this wide thoroughfare to the full force of gusty, dust-laden winds that sweep down it.

In my opinion the discipline to which the trees have been subjected in the circumstances

FIG. 67.—PLANE TREE AS GROWING IN THE MALL.

picture of the correct art of pruning in relation to environment.

The chief factors in the situation in the Mall which demand consideration in connection with the pruning are these:—

- (a) The trees are growing in rich soil. When planted they were well cared for. I saw the planting of several of them, and know, therefore, that the soil conditions are such as to promote vigorous growth with all its advantages and disadvantages.

of their growth has been admirably adjusted to this environment:—

1. The excess of lateral branches has been properly diminished, and the head of the tree has, therefore, been adequately lightened in relation to wind currents, so that risk of upset of the whole tree, and of breaking of branches has been lessened.
2. There is practically no dead wood on the trees to interfere with the development of

healthy branches, or to serve as a seat of infection of disease.

3. The branches which remain have been selected with judgment so as to form a right framework for the future extension of the crown of the tree and their lateral extension has been checked judiciously, so that they have been stimulated to produce quantities of well-placed, leafy shoots which, by their distribution, more than make up for the struggling feeble shoots lost by the removal of the surplus primary lateral branches and the trimming of weak branchlets. No feature of the pruning struck me so forcibly as this one. The checking of these laterals has been most skilfully performed through careful continuous tending of the trees; there has been no vicarious heroic lopping of the kind which frequently passes for pruning. There is no mark of mutilation on the branches; the development of feathery twigs is wonderfully perfect, and an ample

interest of all others. Shoot pruning does not kill roots. The disastrous results that follow over-pruning and, no less, bad pruning of trees arise not from death of roots, but from the deficiency of "branches d'appel"—in our less flexible language "water-lifters"—which are the agents for the efficient distribution of the supply of the water and salts from the intake in the root. Given adequacy in respect of these, all else in the nutritive processes will follow; for the tree, extravagant though it may appear in its output of branches, which are crowded and cumber it, is essentially thrifty in accumulating during opportunity vast stores of reserve food material upon which indent is made for repair and the evolution of new shoots provided the water supply be sufficient. It is the abundance, the healthiness, and the accurate placing of these branches d'appel upon the trees in the Mall that are so significant for the present and future life of the trees.

4. The pruning of the laterals has encouraged the steady upward growth of the

there may be several shoots on different branches competing for the position of leader, and the one that is successful in any year is not necessarily the parent of that one which is the dominant leader in the succeeding year. And, indeed, in nature there is often no distinct leader. There follows from this that when a single main stem is formed it does not come from the continued growth of a single axis elongating at its summit year after year, but it is the product of the combination in more or less vertical line of the bases of branches arising in succession one from the other. What appears to be a simple axis tapering from base to summit is really constructed out of annually formed segments, each the base of a lateral branch, of which the upper part has commonly died in part or in whole. The forking of the stem results from the development of two such systems of segments. The significance of this is evident. The tree in nature is always checking its leader. It is adding to the length of its main stem, not by uniform summit growth of one shoot, but in a zigzag

Gardchron

FIG. 68.—BORDER OF TREE-PÆONIES AT WOOD HALL, SYDENHAM.

(See p. 142.)

leaf surface for the work of the tree in water lifting, breathing, and assimilation has been maintained.

I say this with deliberation because the old theory, contradicted by the operations of coppicing and pollarding, that there is an absolute co-relation between the root system and the branch system of a tree in consequence of which the removal of a branch implies the death of the co-related root, appears to have adherents still. The science of the matter is really this:—The roots depend for the elaborated food material they require for growth upon the area of green assimilating surface exposed by the epigeous portions of the tree to the air, these, in their turn, depend for water and mineral salts upon the area of absorbing hairs upon the root tips. There is no necessary relation between any definite areas in the two regions above and below ground; the colonial organisation of the plant secures the service of every active cell for the

main stem without forking or divarication of the top. The exuberance of apical growth has, however, been wisely kept in check, and a balance between the apical growth and development of laterals has been thus maintained. I say this with emphasis, because this checking of the "leader" has been, I see, specially condemned, and I must endeavour to explain now the reasons which justify the method that has been pursued.

I have stated on a previous page that no shoot in the Plane tree continues growth by a terminal bud. Its elongation is limited. A leading shoot, therefore, in the Plane tree is not a terminal one in the sense in which it is so in a Fir, for instance, but is always an extension of a lateral bud—and that not close to the top—of a parent shoot the upper part of which dies back to, or near to, the point of origin of the lateral bud. In consequence of this method of development

manner through the bases of the successive shoots, the top parts of which are arrested and die. The length of segment added yearly varies with the position on the shoot of the bud which develops into the temporary leader.

That is nature's process. The procedure in the Mall follows it, but on systematic lines:—

- (a) Selection, not the chance outcome of a struggle betwixt competing shoots, determines the position of the shoot that is to be leader.
- (b) Selection determines also, in relation to the general growth in each successive year, the length of the base of the leader that is to be added as a segment to the summit increase of the main stem.
- (c) And then for the method of slow decay by which nature rids the tree of the upper part of the quondam leader is substituted the prompt definite operation of the pruning knife.

It is obvious that there is opportunity in this for the exercise of skill and judgment. No rule can be formulated as a general instruction. Each tree must be studied for the ascertainment of its requirements, which will be governed by its intrinsic vigour, and by its relationship to surroundings. And here I wish to give prominence to one point in its bearing upon the trees in the Mall. Removal of competing leader shoots leaves the selected leader in a position of exposure to wind currents, comparable with that of the individual tree itself in isolated planting. It loses the protection of its fellows, and is in consequence subject to greater risk of breakage, or even of being blown out, entirely than it is where there is no interference with natural branching. In the case of trees like those in the Mall—of vigorous growth in rich soil, forming long leaders with less tenacious wood—the liability to injury in this way is very great, and some of them have suffered. The damage can be repaired by the formation of a new leader, but the accident means retardation of upward growth. The importance of this as a factor in the problem of pruning the trees in the Mall cannot be over-estimated, and it has been well considered, and practice correctly moulded in relation to it by those who have had the direction of the pruning.

If I have made my explanation clear, the Board will realise that the practice pursued in the parks is thoroughly sound, and based on scientific principles. The natural development of the growth-form of the tree has been disciplined to give the form that is required in the particular situation, and in an admirable manner. So well, indeed, that I should like, were it possible, to have a photograph of the trees without foliage and with foliage transmitted to every local body to which the care of trees in thoroughfares is entrusted as an example of what should be aimed at.

I examined also the young trees in the park surrounding the Mall, and found there the same excellence in the pruning.

I may, in concluding, point out that in contrast with, and emphasising the excellence of, the method pursued in the Mall and the parks, the young Plane trees in Piccadilly, opposite Hamilton Place, show mutilation by unscientific pruning—trees with besom tops and twisted truncated limbs bearing a few bristle shoots and an inadequate number of branches d'appel. To anyone who wishes to see side by side illustration of correct and of incorrect treatment of young Plane trees in thoroughfares, I commend a study of adjacent specimens within the Park and in Piccadilly. Unfortunately the Piccadilly type is that which is too commonly found in thoroughfares, and is the cause of the frequent condemnation of the use of the pruning knife on street trees. A photograph of a Park tree and a Piccadilly tree side by side would be an interesting object lesson to circulate along with the photograph which I suggested above. The perfection of pruning seen in the park is rare, and it is a matter for congratulation that there is being prepared in this way within the Park a heritage of fine trees for the admiration and gratification of generations to come.

After what I have said above the Board will not be surprised that I make no suggestion of alteration in procedure in the treatment of the trees. The staff which has brought the trees so successfully through their first juvenile stages may be safely trusted to apply sound scientific principles in the treatment of the trees through their later years of adolescence, and to modify, practice, and adjust it to the immediate and prospective requirements of the trees. The trees are in the making, and the Board may with confidence ask those who are disposed to criticise adversely the method of procedure pursued to recognise this, and to await with patience the gradual evolution of the avenue of stately trees for which the foundation has been securely laid. *Isaac Bayley Balfour.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 64-70.)

(Continued from page 137.)

5, SOUTHERN COUNTIES.

MIDDLESEX.—Both Pears and Plums promised well early in the season, but the good prospects were only partially fulfilled in the case of the former fruits, and less so in respect to Apples. Aphis and American blight have been troublesome on the trees. Our soil is shallow, being only 2 feet deep, and the subsoil is gravel overlaying the London clay. *James Hudson, Gunnersbury House Gardens.*

—Fruits of all kinds set well, and especially Peaches, Plums, Apples, and Pears, but their numbers were greatly reduced through the effects of hot weather when they were small. Strawberries have been very good, but Raspberries and Black Currants were very light crops. Gooseberries were damaged by frost and snow when the bushes were in bloom, but the Gooseberry crop was, on the whole, a fair one. Our soil is of a light nature and the trees have to be watered frequently during dry weather. *H. Markham, Wrotham Park Gardens.*

—The fruit crops in this district are very deficient. Apples are the best crop and Pears are the worst, there being fewer fruits than we have had for several years past. *W. Bates, Cross Deep Gardens, Twickenham.*

—Nearly all kinds of hardy fruits developed a profusion of blossom, but many of the fruits failed to set, especially Pears. Of Apples, Lane's Prince Albert is the most plentiful, whilst amongst Pears Souvenir du Congrès is the most satisfactory variety this season. The Plum crop is somewhat smaller than usual, owing to many of the fruits having dropped. Gooseberries and Red Currants were both heavy crops. Black Currants were small in size and very scarce, the bushes being badly attacked with aphis early in the season. There was a good crop of Strawberries, but the hot, dry weather adversely affected the crop, which was over much earlier than usual. We gathered the first fruits of Royal Sovereign in the open on June 8. Laxton's Epicure is a fine, new Strawberry, the berries being of exceptional flavour; it is a mid-season and late variety. Our soil here is a rather light loam, overlying the gravel. *James Hawkes, Osterley Park Gardens, Isleworth.*

SURREY.—Early in the season the fruit crops were never more promising, but cold winds in April and frosts in the middle of June spoiled the prospects. *S. T. Wright, R.H.S. Gardens, Wisley.*

—The fruit crops generally are above the average. Apples are more numerous than usual and Pears are an average crop for this district, whilst the trees are cleaner than usual. Plum trees are almost ruined by aphides, but the crop of this fruit promises to finish satisfactorily. Cherries were above the average, but aphis was very troublesome on the trees. Peaches, Nectarines, and Apricots are under the average, owing to frosts whilst the trees were in flower. Small fruits, including Currants, Raspberries, Loganberries, and Gooseberries are abundant and good in quality. Strawberries were a good crop, the best varieties being Royal Sovereign, Givon's Late Prolific, Waterloo, Laxton's Latest, and Louis Gautier. Nuts are plentiful; it is several years since Walnut trees carried such heavy crops. Our soil is a light loam, with a gravelly subsoil. *Geo. Kent, Norbury Park Gardens, Dorking.*

—Pears are very scarce, but Apples, in addition to being a good, average crop, are of good quality, and very forward. Black Currants and Strawberries were also satisfactory, but the Plum crop is much below the average. *W. H. Honess, Hopedene Gardens, Holmbury St. Mary, Dorking.*

—Of Apples, Cox's Orange Pippin and Allington Pippin are usually satisfactory varieties. Conference and Princess Pears also crop well. Royal Sovereign, Leader, and Givon's Late Prolific are the best varieties of Strawberries. Black Currant bushes are injured by

the mite, but up to the time of writing I have observed no signs of mildew on Gooseberries. Caterpillars never trouble us. This I consider is due to the absence of digging between the bushes. *James Watt, Mynthurst Gardens, Reigate.*

—The Apple crop promises to be a good one, but rain is needed badly to cause the fruits to swell. Pear trees blossomed freely, but many of the fruits did not set, and the crop is a small one, especially on standard trees. Plums set very badly, and the trees are badly infested with blight. Peaches and Nectarines also are unsatisfactory, the cold weather in spring having spoiled promising crops. Apricots set badly, owing to frosts and snow in the spring. Of bush fruits, Currants set well, but the fruits generally were small, owing to the drought. Gooseberries were a very poor crop, but Raspberries were plentiful, although the fruits were small. Strawberries set well, but the crop was only moderate, the fruits failing to swell for want of rain. The soil in this district is very light, and the crops generally are in want of rain. *James Lock, Oatlands Lodge Gardens, Weybridge.*

SUSSEX.—All fruit trees flowered remarkably well, but the frost and cold winds in the early part of April did much harm, especially to Pears, Cherries, Peaches, and Nectarines. Our soil is a loam, on a subsoil of stiff clay, and is very wet in the winter. *J. Muddell, Sedgwick Park Gardens, Horsham.*

—Gooseberries were a fair crop, and Red and White Currants very plentiful. Black Currants were an average crop of very fine fruits. Plum trees blossomed profusely, and the fruits set well, but drought and a very severe infestation of aphis caused the majority of the fruits to turn yellow and drop. The result is that the crop is not more than two-thirds of the average. Apple trees also blossomed profusely, and mature trees of most varieties have an average crop of fruit, but on young trees the blossom to a large extent proved abortive, reducing the crop as a whole below the average. Pears are almost a failure, and the Cherries also were very scarce, the number of the fruits being reduced by drought. Raspberries were a fair crop. The soil here is a mixture of sand and clay, varying from light to heavy; the subsoil is sand in places and clay or mixed clay and sand in others. *William E. Bear, Hailsham.*

—The fruit crops are very promising, though not so abundant as might be expected from the large quantity of blossom on the trees. Strawberries have been excellent, the varieties Royal Sovereign and Givon's Late Prolific being especially good. Gooseberries were a very fine crop, and Cherries on cordons and fan-trained trees were also good. Raspberries were excellent, as rain fell in time to save the crop. Black and Red Currants were both good crops, although the bushes were badly attacked with aphis, and only after several washings with powerful insecticides were they effectually cleansed. Apple trees also were badly attacked, but they are now clean, and the fruits are swelling rapidly. Much thinning will be necessary on bush trees. Some varieties of Pears are well cropped, while others are carrying only a few fruits. Plums are very satisfactory, all the choice varieties of the Gage type being heavily cropped. Filberts, Cobnuts, and Walnuts are all good crops. Hybrid Raspberries and Blackberries are also satisfactory. Our soil is a heavy clay. *W. A. Cook, Leonardslee Gardens, Horsham.*

—The fruit crops generally are very good; Raspberries, Red Currants, and Gooseberries were all heavy crops, and the dry weather did not affect them, our soil being of a heavy, retentive nature, and all the trees were heavily mulched with manure early in the season. Strawberries were plentiful, but the berries were not quite so large as usual; Royal Sovereign and Waterloo gave better results than Monarch and President. Apples are excellent, Cox's Orange Pippin, Ribston Pippin, Peasgood's Nonesuch, Bramley's Seedling, and Worcester Pearmain being some of the best cropped varieties. *W. J. Langridge, Ote Hall Gardens, Burgess Hill.*

WILTSHIRE.—Apples are excellent in many places, whilst in others both the crop and the quality are indifferent. Bush fruits, with the

exception of Raspberries, were good and plentiful. W. Gullick, Wilton Road Nursery, Salisbury.

—The scarcity of Pears and Plums is due in a large measure to the previous unfavourable autumn, and the consequent unripened condition of the wood. There was an abundance of blossom on fruit trees, but nearly all the flowers were imperfect. These remarks apply especially to the tender varieties of Apples and Cherries. Thomas Challis, Wilton House Gardens, near Salisbury.

7, ENGLAND, N.W.

LANCASHIRE.—The early prospects of abundant fruit crops have not been realised. Cold, dry winds when the blossom was expanded, and a long spell of drought afterwards, caused most of the fruits to fail. A severe infestation of aphids also helped to cripple or destroy the bloom. Subsequent rains caused what fruit did remain to commence swelling, and the quality promises to be good. Our soil is of a heavy, retentive nature overlaying clay. E. F. Hazelton, Knowsley Gardens, Prescott.

—There was a good show of blossom on fruit trees, but late frosts did much harm and the cold weather was followed by heat and drought when the fruits were setting, causing many of them to drop. Strawberries and other small fruits have been very satisfactory. Pears are a very poor crop. A portion of our soil consists of a rather cold, heavy clay, which is not suited for fruit culture. Thomas Wyton, Abbeystead Gardens.

WESTMORELAND.—All fruit trees and bushes flowered remarkably well, but the crops are small. Syringing with quassia and soap have cleared the trees of aphides, and at the time of writing the foliage is clean and healthy. Pears are a thin crop, but Apples are good, particularly the varieties Annie Elizabeth, Bismarck, Lane's Prince Albert, and Bramley's Seedling. Raspberries were a heavy crop. Strawberries were of good quality, Royal Sovereign being our standard variety. The soil in these gardens is light and gravelly. W. A. Miller, Underley Hall Gardens, Kirkby Lonsdale.

—The Apple crop was very promising early in the season, but owing to cold, easterly winds and drought in May, with an infestation of aphides, the crop has been practically spoiled. Plums are a very fair crop, especially on wall trees. Strawberries were smaller than usual, but a fair, average crop. Our soil is a heavy loam resting on clay. F. Clarke, Lowther Castle Gardens, Penrith.

—There was a promise of a good fruit season when the trees were in bloom, but the dry weather at the end of May and in June spoiled the prospects for a good fruit year. We had an over-crop of Raspberries, the variety Superlative being especially fine. Currants were in good quantity, but small in size. Strawberries were a small crop and the berries under-sized, notwithstanding the beds were mulched. Our soil overlies limestone gravel. J. Moorhouse, Dalton Hall, Burton.

8, ENGLAND, S.W.

CORNWALL.—With the exception of small fruits and Strawberries, the hardy fruit crops are very disappointing. Owing to the wet, sunless autumn of 1910 the wood of fruit trees did not ripen well, especially in the cases of Apples and Peaches. We also experienced cold, east winds during the first week in April, which ruined the Pear and Plum crops. Our soil is of a rather light nature, with a marly, rock subsoil. W. Andrews, Tregothnan Gardens, Truro.

—Apples and Pears are, on the whole, of a poor quality, but the crops of these fruits promise to be much better than those of last year. The crops of stone fruits were ruined by frost and cold, east winds. During early April 10° and 11° of frost were registered, doing much harm to the vegetation in this district. Soft fruits, and Strawberries especially, are good and plentiful. The soil here is mostly of a poor, gravelly nature, and largely consists of granite and ironstone. Frank J. Clark, Tehidy Park Gardens, Camborne.

(To be continued.)

THE FLOWERS OF CHAUCER.

(Continued from page 126.)

RAISINS.

Nor of the reisisn have the wyne,
Til grapes be ripe and welle afyne.
Romaunt of the Rose, VII. 127.

Raisins here are not the dried fruit, but the ripe Grapes fit for picking.

REED.

1. But rede that boweth down with every blast,
Lightly cesid the wynd, it wil up ryse.
Troylus and Crysed, V. 104.

2. Thys hous of whiche I rede,
Was made of twigges, salwe, rede.
House of Fame, VI. 256.

ROSE.

1. With the rose colour strof hire hewe.
Knighes Tale, I. 121.

2. Thou with thi garlond, wrought with rose
and lylie.
Secunde Nonnes Tale, III. 7.

3. This aungel had of roses and of lillie.
Corounes tuo. *Ib. 13.*

4. Whennes this soote savour cometh so
Of rose and lilies. *Ib. 14.*

5. Sche [Nature] can peynte a lili white
And rody a rose.
Tale of the Doctor of Phisik, III. 59.

6. His lippes reed as rose.
Tale of Sir Thopas, III. 118.

7. Many a thousand daisies, rede as rose.
Court of Love, IV. 133.

8. Her colour gan apere,
As rose so red.
Court of Love, IV. 167.

9. Such a sight it was to sene, I trow,
As of these roses ruddy on their stalke.
Ib. 173.

10. Right as the fresh redde rose newe
Against the sommer Sunne coloured is.
Ib. 207.

11. She wax as rede as rose.
Troylus and Crysed, V. 100.

12. Hir rose garlonde white and rede.
House of Fame, VI. 198.

13. Amonge a basket ful of roses. *Ib. 248.*

14. She semede lyke a rose newe
Of colour.
Romaunt of the Rose, VII. 41.

(The *Romaunt of the Rose* is full of notices of the Rose. Many of them simply give the name, but a few are descriptive. I think it best to omit all that have not some descriptive character.)

15. A roser chargid fulle of rosis,
That with an hegge aboute enclosid is.
* * * * *

The savour of the roses swote
Me smote right to the herte rote,
As I hadde alle embawmed be.
* * * * *

Of roses ther were grete wone,
So faire wexe never in Rone.
Romaunt of the Rose, VII. 67.

16. Chapelett of roses of Whissonday.
Ib. 85.

17. I saw the rose whanne I was nigh,
* * * * *

Fressh, rody, and faire of hewe,
Of colour ever ilyche newe. *Ib. 125.*

18. Agayne the sunne, that roos as rede as rose.
Legende of Good Women, VIII. 47.

19. A fret of rede rose loves,
The fresshest syn the worlde was first
begonne. *Ib. 51.*

20. She was faire as is the rose in May.
Ib. 64.

21. Fairer than rose, sweeter than lilly flour.
Lamentation of Mary Magdalene, VIII. 180.

In all Chaucer's notices of the Rose there is one epithet worth noting. All his Roses are red. There are no British Roses that can be called a true red; the pink Rose of the Sweet Briar comes nearest. The red Roses of Chaucer must be

foreign species, probably *R. gallica*, and this is a proof, among many others, that English gardens in his day were not the dull, grey, herb gardens that they are generally supposed to have been. I think it would be easy to prove that English gardeners, from the earliest times, have done their best to make their gardens bright and beautiful, and not merely adjuncts to the still-room. I believe a love of beautiful gardens is an essential part, and always has been, of the British mind.

RUSH.

The stalke was as rish right.
Romaunt of the Rose, VII. 68.

RYE.

Gif us a busshel whet, or malt, or reye.
Sompnours Tale, II. 105.

SAFFRON.

His heer, his berd, was lik safroun.
Tale of Sir Thopas, III. 118.

The Crocus that produces the Saffron was grown in England before Chaucer's time.

SAGE.

Fermacyes of herbes, and eek save
They dronken, for they wolde here lyves have.
Knighes Tale, I. 176.

Save is the Salvia or Sage. There was no plant of higher medicinal reputation in mediæval days. It was supposed to be a panacea for every complaint; hence the line:

"Cur moriatur homo cui salvia crescit in horto?"

To which came the truer answer:

"Contra vim mortis non est medicamen in hortis."

SALLOW.

1. Who that buyldeth his hous al of salwes

* * * * *

Is worthy to be bonged on the galwes.
Prologe of the Wyf of Bathe, II. 65.

2. And al thys hous of whiche I rede,
Was made of twigges, salwe, rede.
House of Fame, VI. 256.

Sallow is one of the old names of the Willow, derived from the same root as the Latin *Salix*.

SETWALL.

See Ceetwall.

SLOE.

Blak as bery, or ony slo.
Romaunt of the Rose, VII. 43.

SYCAMORE.

1. [The hedge] with sicamour was set and
eglatere.

Flower and the Leaf, IV. 239.

2. Upon a table of sygamour.
House of Fame, VI. 236.

TARES.

1. Ne sette I nought the mountaunce of a tare,
So that I couthe do ought to youre
plesaunce. *Knighes Tale, I. 139.*

2. But thereof sette the meller not a tare.
Reeves Tale, I. 223.

3. Of al her art ne counte I nat a tare.
Ib. 225.

THISTLE.

1. Thesteles sharpe of many maners.
Romaunt of the Rose, VII. 69.

2. (Ther were) and also thistleles thikke.
Ib. 72.

THORN.

Thorn, beech, hasil.
Knighes Tale, I. 182.

H. N. Ellacombe, Bitton Vicarage,
Bristol.

(To be concluded.)

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

BURLINGTONIA.—The small group of epiphytic Orchids known as Burlingtonias is now included in the genus *Rodriguezia*, but for garden purposes it may be regarded as distinct. The Burlingtonias include several attractive species, for though the flowers are small, the plants are bright and effective, being free in blooming and of compact habit and growth. The best plan is to grow them in teak-wood baskets, or pans, affording them a moderately thin layer of compost, consisting of *Osmunda* fibre, *Polypodium* fibre, and *Sphagnum*-moss in equal parts. Provide sufficient material for efficient drainage, and surface the plants with a layer of clean, chopped moss. It is a mistake to suspend them close to the roof glass on bare blocks, for, if not prevented the plants will grow so far away from their root-hold that the young pseudo-bulbs will become weakened from want of food. To prevent this, use receptacles that are sufficiently wide to allow the rhizomes to be pegged down to the compost as they lengthen. The plants should be afforded a mild temperature, plenty of ventilation, and a light shading. They should be suspended from the roof-rafters, and, at no time should they be over-watered, although all through the year they require a little moisture.

PILUMNA.—The four species of *Pilumna* have been placed under *Trichopilia*, but they are still best known to gardeners as *Pilumnas*. *P. nobilis* and *P. fragrans* are two charming autumn-flowering Orchids. The plants may be purchased cheaply and are easily managed. They are profuse bloomers, the flowers being very fragrant, and capable of lasting a long time after cutting. *Pilumnas* succeed best treated as pot plants, grown in a mixture of *Osmunda* fibre two parts, Oak leaves one part, chopped *Sphagnum*-moss one part, and some coarse silver sand, the components being mixed thoroughly. The pots should be well drained, and the compost pressed moderately firmly about the roots, finishing with a layer of *Sphagnum*-moss. The plants grow freely in cool conditions. They should receive copious supplies of water during their season of active growth, but when the shoots are mature only sufficient moisture to maintain the pseudo-bulbs plump and the roots in a sound, healthy condition is needed.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

THE SEASON.—One hears from all parts of the abnormally early flowering of autumn plants with pessimistic forebodings of the condition of the flower garden a month hence. The hot weather on the 9th inst. had by far the worst effect on flowers than any previous day, the heat, with a brisk breeze, causing the plants to wilt and the blooms to wither and drop in a manner hitherto unexampled. I am hopeful that the shorter days and the cooler nights will do much to correct matters. Meanwhile Sweet Peas here have been picked bare of flowers and seed pods. Violas, which have in many places been unsatisfactory, have been denuded of their seed pods for the third time and other plants have needed similar attention. Almost everything has had to be watered, at every second or third day. Lobelias, which are apt to die from exhaustion caused by a too abundant flowering, have had fresh soil placed about them. *Calceolarias* have made less growth than usual, but the plants are now in a fair way to make up for lost time. Single Dahlias are awaiting attention, numberless seed-pods having formed in the course of a few days. The old flower-stems will be cut out, thus allowing space for fresh shoots. Cactus-flowered Dahlias will need to be pruned at brief intervals to permit of the flowers being seen, the growths, in most varieties, hiding blooms if left unchecked. As soon as the flowers of stock-flowered Larkspurs begin to fade

the spikes should be cut off to encourage the early formation of fresh inflorescences. Annual Chrysanthemums, as well as varieties of *C. maximum*, develop seed quickly, and the flowers, as the florets wither, should be removed. Any plant needing supports should be secured to stakes without further delay.

LAVENDER.—Greater use might be made of this common herb in the flower garden, for its colour is as fascinating as its scent is delicious, and, with the exception of very cold and damp situations, it will grow well in any locality. Custom has decreed that the Lavender shall be regarded as a useful plant rather than one of much beauty. Nevertheless, it is handsome in a mass, and is sometimes planted as a low hedge by the side of Grass walks, and I have seen it associated with hybrid Tea Roses with good effect. Where no other means exist of introducing the plant to the flower garden, a space may always be found for it in the mixed border, or, as a last resource, it may be introduced amongst shrubs with such other neglected plants as Rosemary, Wormwood and Rue.

PENTSTEMON.—The Pentstemons are at their full flowering beauty. If it is desired to perpetuate any of the choicer seedlings as well as named varieties, the cuttings may be inserted forthwith. They do very well dibbled into beds of sandy soil in cold frames, or in cutting boxes or small pots. A simple method is to fill a number of pots with suitable soil, plunge the pots as closely as possible in a cold frame and insert a single cutting in each pot. Plenty of side shoots suitable for cuttings may be had, and these are superior to the tips of the main shoots for the purpose. On no account should the shoots be allowed to flag, either before or after they are inserted, and for that reason the frames must be kept close, the cuttings sprayed regularly, and shaded during strong sunshine. The cuttings of the hardier bedding varieties should be inserted in beds, but they must be treated in all other respects similar to those in pots. Any variety selected for seed production should be marked to prevent the spike being cut off when the flowers have fallen.

GAINING SUGGESTIONS FOR NEXT SEASON.

First-hand intelligence is always desirable in practical gardening, hence opportunities should be taken during the next few weeks to inspect other gardens with a view to gaining fresh ideas or becoming acquainted with unknown plants. Besides gaining suggestions during such visits, one may perhaps notice faulty associations and arrangements, affording object lessons to be avoided. It must, however, be remembered that there are gardens in which effectiveness is not so much the aim as variety. In most gardens edgings prove a weak feature of flower gardening, and it should be noted whether, in otherwise good schemes, the edgings add to or lessen the good effect. They are by no means essential, and the practised eye may at once notice whether they have an advantage. Another fault is the excessive use of some popular plant, say the *Antirrhinum*, which possesses flowers of a great variety of colours. In more than one instance I have seen floral schemes quite spoiled by indulging in a too lavish use of colours. If the scheme for next year's bedding can be settled now it will save much labour and anxiety in the spring. It is an advantage to plan an alternative scheme, which exigencies during winter may make it desirable to adopt.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

RHODODENDRON JASMINIFLORUM AND R. JAVANICO - JASMINIFLORUM HYBRIDS.—Although these greenhouse Rhododendrons require a degree of warmth somewhat higher than that maintained in the average greenhouse (50° Fahr. as a minimum), and a somewhat moist atmosphere, they will grow well planted out. In small pots these choice plants are not always a success. A span-roofed greenhouse with a central bed, this being given up to their culture, forms an admirable house for them, whilst the side stages may accommodate Ferns in pots, such as a stock of *Adiantum cuneatum* for supplying cut fronds. This will indicate as nearly as possible what the requirements of the Rhododendrons really are. Plant

them in rather rough peat mixed with tough, fibrous loam and provide plenty of materials for drainage purposes. Make the bed quite firm at the time of planting, which should be done, if possible, during August.

NERINE.—If any repotting is needed in the case of these handsome autumn-flowering bulbs it should be attended to without delay. It is better to do this before than after the flowering period, and the work affords an opportunity for grading the bulbs, putting the largest ones together in the biggest pots and so on in proportion. Use drainage materials freely; if the pots are filled to almost one-third of their depth with crocks it will not be too much. Select the best possible loam, full of fibre and substance, and mix with it a quantity of well-pulverised mortar rubble to keep it porous and open. Cover the bulbs about one-half their depth with soil, and secure them firmly therein. Examine those also that may not need repotting and see that the drainage is perfect, with no indications of worms at the bottoms of the pots. A watering with weak lime-water will drive any worms out of the soil that may be present.

VALLOTA PURPUREA.—I am induced to mention this fine old plant at this juncture because of the partiality that worms appear to have for the soil in which they grow. A stagnant soil is most injurious to this plant, whereas, if the soil is kept properly drained, a great difficulty in the culture of the *Vallota* is overcome. Where these are flowering pollinate a few of the stronger flowers for the purpose of raising a fresh stock from seed; allow only one seed-vessel to develop upon each bulb. If this method of culture were generally followed, and over-potting carefully guarded against, there would be failures in growing this useful plant.

THE GREENHOUSE.—The present is a suitable and convenient time for the potting of hard-wooded plants. I refer specially to large specimens and those of a medium size. The potting may be done up to the latter end of August, but be careful not to disturb any in flower or about to bloom. The peat used in the potting must be of the best quality; it should be hard and consist largely of fibre. Soft or spongy peat is suitable for many plants, including Ferns, but not those of a hard-wooded nature. As the plants will occupy their pots for a considerable time, the potting should be thorough and the materials of the best quality. Employ a certain proportion of fibrous yellow loam, except in the cases of *Erica*, *Epacris*, *Darwinia*, and *Aphelexis*. A small amount of charcoal broken about the size of nuts will serve a good purpose if silver sand of the best quality is not available; some charcoal should be used in any case in potting plants of *Darwinia* and *Aphelexis*, as it suits their delicate, slender roots. Pot firmly and keep the collar of the plant raised somewhat. See that the ball of each plant is moistened thoroughly before the potting is commenced, and after it is finished give a good watering. The majority of the plants may be stood out-of-doors in a sunny situation to favour a hard, enduring growth.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

CURRENT BUSHES.—Black Currant bushes may now be partially pruned by removing all the old fruiting wood, as this will greatly assist the ripening of the growths of the current year, which will furnish fruits next season. Red and White Currant bushes also may have the superfluous side growths removed for a similar reason, and it will also lessen the amount of pruning at a later date. All fruit trees that have not been thoroughly cleansed of insect pests or deposits of dirt will be much benefited by frequent syringings.

STORING FRUIT.—If not already done, the fruit room should be made ready for the reception of the fruit. Walls, shelves, and all wood-work should be thoroughly cleansed, and an abundance of fresh air afterwards admitted to thoroughly sweeten every part of the interior of the building. It is the practice of some to arrange a layer of straw or hay on the shelves, on which to place the fruit, and this cannot be too strongly condemned. The least mustiness of these materials will quickly impart a musty

flavour to the fruit, and there is a danger from moisture which both hay and straw absorb and retain from the atmosphere. Strips of coarse canvas sheeting are much to be preferred, as these may be removed easily, washed, and dried as often as is necessary, and they will last in a good condition for several years. The gathering of Apples and Pears should, if possible, be done during the middle of the day, or at a time when no moisture is present on them. As the fruit is gathered, it should be conveyed to the fruit room, carefully placed on the shelves, and labelled with the name of the variety. Some gardeners, after the fruit has been stored, cover the choicer varieties with thin canvas, tiffany, or sheeting, which not only keeps the fruits clean and free from dust, but tends to their preservation by preventing a too rapid evaporation of the juices. The most important points to be observed in the storing of fruit appears to be the exclusion of air currents, the maintenance of a moderately low and equable temperature, and the exclusion of direct sunlight. Artificial heat is not necessary in a properly-constructed fruit room, for too much warmth will hasten the ripening of the fruit, and many will be spoiled before they are required for use.

STORING NUTS.—Filberts, before being stored, should be well dried upon mats or cloths, and have the husks removed from them. When they are quite dry, they may be laid in boxes and placed on shelves in the fruit room. Some prefer to select the finest Nuts and pack them in sand or bran, in an earthenware vessel—a method frequently employed for preserving Walnuts.

GENERAL REMARKS.—Protect all ripening fruits from birds and insects. Earwigs, wood lice, flies, and wasps are now very troublesome in the fruit garden, and should be destroyed or trapped by every possible means. Cover the trees, wherever possible, with hexagon netting or tiffany, and suspend wide-mouthed bottles, partly filled with some sweet liquid, such as sweetened beer, or treacle and water, on various parts of the walls or trees. The shoots of wall trees should be secured by nailing or tying, and the lateral growths stopped. If the directions given in previous Calendars have been carried out, very little work of this kind is now necessary. Gather Plums as soon as they commence to ripen, especially if the weather is showery, as the fruits are soon cracked and spoiled by rains. Grafts on old trees that were headed back should now be tied securely to stakes to prevent them being broken by winds. Remove all shoots growing from the stock below the grafts.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

CHERVIL.—Make frequent sowings of Chervil in some shaded part of the garden. Water the plants freely in dry weather in the evening. About the middle of September a good sowing of Chervil may be made to furnish plants for the winter. Choose a sheltered site where protection from frost and snow may be afforded.

SWEET MARJORAM.—Plants of this herb set out a month or more ago should be cut to within 2 inches of the ground and allowed to make fresh growth before they are lifted and potted for winter supplies. The plants should be wintered in a slightly heated frame, removing the lights during fine weather to prevent the foliage from damping.

BASIL.—If seed of Basil is sown now and the seedlings pricked off into pots as soon as they are large enough, the plants will furnish a plentiful supply of green leaves throughout the winter. Grow them in a temperature of 65°.

WINTER ONIONS.—A sowing of Onions for winter use should be made at about the end of August in ground which was manured for some early crop. The soil should be dug deeply, breaking the particles finely, and afterwards treading it moderately firmly when it is dry enough for this operation. When the surface has been made level, drills should be drawn 15 inches apart and the seeds sown thinly, in order to promote the growth of sturdy plants for spring planting. If the ground is dry at the time of sowing, the drills should be soaked thoroughly with clear water the night previous. Sow the seeds in the early morning before the

soil in the drills becomes caked by the sun. Ailsa Craig, Golden Rocca, and White Lisbon are three of the best varieties for sowing now. Spring Onions will be ready for lifting earlier than usual this season. As soon as the tops have died down, lift the bulbs carefully, allow them to remain on the bed, and carefully turn them on every fine day until the tops have quite withered. When ripened, they should be stored in a well-ventilated loft.

WINTER CUCUMBERS.—The present is the best time to plant Cucumbers for furnishing early winter supplies. If fermenting material is available, a hotbed should be made up to within 2 feet of the roof-glass, and on this small mounds of soil should be placed to within 5 feet of each other. When the temperature of the bed is 85°, the planting may be done, but the temperature of the bed needs to be watched carefully, as the young roots may be injured by excessive fermentation. If the temperature should rise too high, make a few holes in each mound to allow some of the heat to escape. Place a stick to each plant, and secure the main shoot with a tie until it reaches the trellis, when the top may be pinched out to encourage the development of the side shoots as quickly as possible. Use the syringe freely to maintain a moist atmosphere. Plants from which Cucumbers are being cut should be given liquid manure freely. Keep the growths well thinned and avoid over-cropping. Seeds may be sown now to procure a supply of seedlings for planting in September. These plants should not be allowed to fruit until the end of the year, when they may be expected to furnish supplies throughout the spring months.

ASPARAGUS.—In hot, dry weather, Asparagus plants often ripen large quantities of seeds, which cannot be removed without damage to the plants. If the beds are well soaked with manure water three or four times before the growing season is over, injury may be prevented. In exposed positions no time should be lost in staking and tying the plants, especially young plantations that were formed last spring.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

TOMATOS.—Tomato plants require plenty of manurial stimulants to assist the fruits to develop. Gather them immediately they have coloured, or if of very large size they may be picked a little before they are quite ripe and allowed to finish on a warm shelf. Prevent a too humid atmosphere, as this, together with an excess of water at the roots, frequently causes the fruits to split. Any fruits that show exceptional merit in form, colour or productiveness should be saved for seed purposes. Select the best specimens, ripen them thoroughly, wash the pulp through a fine sieve, and afterwards dry the seeds. The present is a good time for making a sowing to raise plants for winter fruiting. Select a variety that is known to be of a free-setting nature.

FRUIT TREES IN POTS.—The earliest-forced pot-trees of Peach and Nectarine will need attention in repotting, which is best done before the trees lose their foliage, and the roots become inactive, as the trees then become well established before they are taken indoors again. One of the most important items in connection with the potting is the provision of proper drainage, which to some may seem unimportant. It is not the quantity of crocks that matters, but selecting them of sufficient size according to the nature of the pots, arranging them properly and covering them with some material, preferably turfy loam, to prevent the fine soil from clogging the crocks. Trees in large pots will, in many cases, have to remain in the same receptacles, but smaller trees will benefit by a shift. Before commencing the work, have the soil and other necessities in readiness. A suitable compost is formed of good turfy loam, broken in pieces, and mixed with wood-ashes, lime-rubble and river sand. Pot the trees firmly after having first removed carefully all the old soil possible from the ball, and shorten with a sharp knife any thick roots which do not possess fibrous roots. Make quite sure that the new soil reaches the base of the pots by adding it gradually and ramming after each fresh addition. After potting, give a thorough watering with a rose-can, and stand the pots

where they may be shaded for a time. Syringe the trees frequently, but exercise care in applying water to the roots. In the case of large specimens, reduce some of the old soil around the edge of the pots, and loosen the roots carefully with a pointed stick, so that new soil may be added.

FIGS.—Fig trees in pots also need potting or top-dressing, as the case may be, at this season. These plants do not require disturbing annually, as is necessary with Peaches, provided the drainage is in a proper order and the trees healthy. Young plants, however, may be given frequent shifts. Any plants not requiring potting will be benefitted by a top-dressing of sweet material, removing the old soil as low as can be done without injury to the roots.

MELONS.—The season has been an ideal one for the culture of Melons, and the result has been the production of fruits of the highest quality and good flavour. Where the fruits have just set or are swelling, plenty of atmospheric moisture must be provided, and the plants syringed well to destroy red spider. Plants on which the fruits are swelling should be given liquid manure and other stimulants. A slight circulation of heat in the hot-water pipes at night will be beneficial at this season. Ventilation may be afforded in the day time during hot weather to encourage a sturdy growth. Admit fresh air freely in houses where the fruits are ripening and withhold water. As soon as the plants in pits are cleared of their fruit they should be removed without delay, so that the walls may be limewashed and the house made clean. Where plenty of fire-heat is at the command of the grower there is still time to plant another batch of Melons. Select a house where the maximum amount of sunlight may reach the plants, as this will be found invaluable later in the season.

WASPS.—The greatest care should be exercised in preventing wasps from gaining access to fruit houses. Within a radius of one mile we have destroyed 230 nests.

THE APIARY.

By CHLORIS.

HONEY DEW.—It is probable that samples of honey will this year be spoiled by the addition of "honey dew." In order to ascertain if any is present in the comb, hold a section or shallow frame before a strong light—sunlight, if possible—and if "honey dew" is present it will give the honey a smoky appearance. Another test is the sooty flavour.

RE-QUEENING.—The present is an excellent time to introduce fresh queens. There are many points to be borne in mind, when choosing a queen. Temper must be considered, for this is a trait which cannot safely be ignored, and hybrids seem to inherit all the bad qualities of the races from which they have been raised. In some cases the stocks from such queens cannot be manipulated with safety even by the most skilled apiarists, because the bees are so vicious. Again, the descendants of some queens are given to excessive swarming, which is not desirable. Some stocks build a large amount of brace comb, whilst others make poor cappings, giving the combs a watery appearance that detracts from their appearance. In choosing foreign queens, remember that Carniolans are quiet and prolific, and that they cap sections almost as well as the native bee, but they swarm excessively. Ligurians or Italian bees may be distinguished easily by the three yellow bands around the abdomen. These bees breed rapidly during the spring, are easily handled, and, unlike most foreign strains, they remain on the comb during manipulation. They have a long tongue, which enables them to reach nectar far out of the reach of other breeds, they do not swarm excessively, and are about the best type for a large production of extracted honey. The Cyprians are very pretty, and they gather large quantities of honey, but they are very excitable, difficult to handle, and no one should operate amongst them without a veil and a smoker well charged. The temper of Syrians is much the same, and for this reason they should be avoided. The price of all queens is low during August and September, so that the present season is the best time to buy them. In all cases, insist on a written guarantee being given that the queens are from apiaries free from disease.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, AUGUST 26—
Symington Fl. Sh. Hawick Fl. Sh.

TUESDAY, AUGUST 29—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Fred. Enock, F.L.S.)

WEDNESDAY, AUGUST 30—
Nat. Vegetable Soc. Sh. in Roy. Hort. Soc. Hall, Westminster. Irish Gard. Assoc. and Benev. Soc. meet. Cheshire Agric. Soc. Sh. at Chester. Salisbury and District Gard. Soc. Annual Outing.

THURSDAY, AUGUST 31—
Dundee Fl. Sh. (3 days).

SATURDAY, SEPTEMBER 2—
Border Hort. Soc. Sh. at Coldstream. Soc. Française d'Hort. de Londres meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—60.1°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 23 (6 P.M.): Max. 70°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 24 (10 A.M.): Bar. 29.9°; Temp. 71°; Weather—Sunshine.

PROVINCES.—Wednesday, August 23: Max 68° Cambridge; Min. 58° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs in all varieties, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

WEDNESDAY—
419 cases Liliun Harrisii, Roman Hyacinths, and thousands of Miscellaneous Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 2.

The Orchids of South Africa.* The sudden death of Dr. H. Bolus, the author of this work, was recorded in these pages on June 3 last, and was followed by the announcement that he had endowed a Botanical Chair in the South African College, Cape Town.

Dr. H. Bolus was a successful stockbroker, though, as he often said, he disliked the business, and he retired many years ago, thereafter to devote himself to the botanical investigation of his adopted country. This work he carried out with great enthusiasm, travelling widely and collecting copiously. Although Orchids were his favourite plants, his studies embraced the whole of the vascular species, and probably no other botanist knew the plants of South Africa so well as he knew them. He visited this country many times in order to compare his specimens with the

numerous types preserved in the various herbaria. In the spring of the present year he came again to England to see the present volume through the press, and, as a note on the verso of the half-title tells us: "The last pages of this book were finally corrected by the author on the eve of his death."

His first independent publication on the Orchids of South Africa bears the title: *The Orchids of the Cape Peninsula*. This volume, which appeared in 1888, contains descriptions of 102 species, illustrated by 36 partly-coloured plates from his own drawings. Then came the first volume of the present work, which was issued in parts between 1893 and 1896, and contains the same number of plates as the second volume and similar letterpress. A third volume is to follow, edited by his niece, Miss H. M. L. Kensit, B.A., who assisted Dr. Bolus for many years in botanical and other work. A sum of £8,000 is set apart by his will for its publication. The letterpress of the two volumes already issued consists almost entirely of descriptions (Latin and English), synonymy and geography of species; but most likely the author had reserved a synopsis of the genera and biological and other notes for the concluding volume. There are many highly interesting supplementary observations on various phenomena of Orchid life in *The Orchids of the Cape Peninsula*, and doubtless the author had put on record others of equal interest. At present there are no complete statistics of the Orchid flora of South Africa as at present known, but in 1888 upwards of 100 species were known to inhabit the Peninsula. Taking the predominating colours in the flowers of each species, Bolus classed 9 as green; 32 as yellow; 8 as brown; 24 as red; 14 as blue; and 16 as white. With respect to odours he observed that, as a general rule, those of red hues were the least fragrant; those with white flowers most fragrant, while the scent of some, especially those having yellow flowers, was heavy and unpleasant. By far the greater number of South African Orchids are terrestrial; few of them showy, but they are often of curious structure. The few epiphytes belong to the genera *Angræcum*, *Ansellia*, *Mystacidium*, *Polystachya*, and *Listrostachys*, none of which has really showy flowers. Of the characteristic African genera: *Satyrium*, *Disa* and *Eulophia*, 16, 29 and 18 species are figured respectively in the present volume. *Disa grandiflora* takes the earlier though less appropriate name of *D. uniflora*. Of the figures themselves, prepared by the author, it may be said that, though possessing no great artistic merit, they are carefully and faithfully executed, and they will be of great service to the field botanist. The name of Bolus will go down to posterity, both as a worker and patron of the branch of natural history which he loved so well. The plates bear dates from 1882 to 1904, and the colour in some instances seems to have faded. About 25 per cent. of the species figured were first described by the author.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on Tuesday, 29th inst., at 3 p.m. Mr. F. ENOCK, F.L.S., will deliver a lecture on "Insect Pests." At this meeting the Hon. VICARY GIBBS will exhibit a large number of trees and shrubs raised from seeds collected in China by Mr. E. H. WILSON.

FESTIVAL OF EMPIRE ROSE SHOW.—The dates of this show at the Crystal Palace have been altered from August 31 and September 1 to September 28 and 29.

TURIN INTERNATIONAL EXHIBITION.—We learn from the Board of Agriculture and Fisheries that it is proposed to hold a temporary show in connection with the Milk Industry at the International Exhibition in Turin from October 1-15. Applications for space at the show must reach the executive committee of the exhibition, via Po, 2, Turin, by the 30th inst. The amount of space required, and whether any motive power is desired should be stated. Further particulars may be obtained at the office of the Intelligence Division of the Board, 8, Whitehall Place, London.

FINGER AND TOE DISEASE.—Experiments with this disease have been recently conducted by Mr. WALTER E. COLLINGE, who finds that lime, followed by a dressing of sulphur, is much better in checking the disease than lime used alone. A field known to be very badly attacked was treated in the autumn of 1909 with a dressing of 15 cwt. of ground, unslaked lime. In the spring the same land was given a dressing of flowers of sulphur, 5 cwt. to the acre. An excellent crop of Swedes was lifted the following autumn, and the roots were practically free from disease. On only one corner of the field was disease noticeable, and this very small. On this patch there was a considerable amount of heavy clay, which was in a very wet and sticky condition, and, quite apart from the fungus disease, badly required liming. A part of this ground, about one-sixth of an acre in extent, was again treated with ground, unslaked lime at the rate of 12 cwt. to the acre in the autumn, followed in the spring with sulphur as on the previous occasion. When the Swedes were lifted in the autumn of 1910 no trace of the disease was found, and the physical condition of the soil had greatly improved.

WEATHER WISDOM.—Much useful information about what is popularly termed "the weather" may be gleaned by farmers and gardeners from a little book of fewer than 50 small pages, entitled *Weather Wisdom in Agriculture*.* If it does not help them to predict coming weather for more than a brief period in advance they will, at all events, be better able to understand the forecasts issued by the Meteorological Office in the daily papers. At the same time, they will obtain some knowledge, it may be for the first time, as to how our various weather conditions are brought about and why at one time they are so provokingly persistent and at others almost as provokingly changeable. If only average states of the atmosphere—in other words, seasonable weather—could be depended on in these islands from day to day throughout the year, the British climate would be as nearly perfect as it well could be for almost all kinds of vegetation, both on our farms and in our gardens. But as such seasonable conditions are rather the exception than the rule, we must rest contented with the good, though much abused, climate we already have, and endeavour to make the best of it with the help of such little weather primers as the one under notice.

* *Icones Orchidearum Austro-Africanarum extratropicarum*, or Figures with Descriptions of Extra-Tropical South African Orchids, by Harry Bolus, vol. II. (London: Wesley & Son.) 1911.

* By W. R. Dunlop. Price 1s.

MISS WILLMOTT'S ROSE BOOK.—The first volume of *Genus Rosa*, consisting of 12 monthly parts, is now published. A second volume, containing also 12 monthly parts, will complete the work. The edition is limited to 1,000 copies, the subscription price being £1 1s. for each part. The publishers are Messrs. HENRY SOTHERAN & Co.

CO-PARTNERSHIP FESTIVAL.—The entries for the flower show in connection with the Co-partnership Festival (of which Mr. HENRY VIVIAN is the president for the year), which is to take place at the Hampstead Garden Suburb on Saturday (26th inst.), are now complete. There will be something like 1,000 exhibits on view. The festival will also provide a concrete example of the

to complete a colony of 1,400 houses on 145 acres on the borders of Hampstead Heath, providing for an estimated population of about 25,000. The festival will include a choir contest, for which there are a score of entries, from co-partnership and kindred societies in the provinces, while a pageant of history will be performed by 300 residents in the suburb. *George Morriss, Hon. Sec.*

RUST OF BROAD BEANS.—Broad Beans in the West of England have been badly attacked this season with the rust fungus (*Uromyces fabae*). The disease first attacks the leaves and haulms, upon which it appears as rusty spots, and the spores rapidly spread to the rest of the plants. Infection from year to year takes place from the diseased spots on the old haulms stored in the

last year the orchardists of Ontario made their first tentative attempt to obtain a footing in the English markets. Their success surpassed all expectations; the importers were as satisfied as they were surprised by the quality, appearance and flavour of the fruit; and this year, therefore, Mr. C. A. DOBSON, of Jordan Harbour, Ontario, has made arrangements to send to England about 14,000 boxes of choice Peaches. The fruit is kept in cooled chambers on the voyage, and arrives in excellent condition. All arrangements have been completed for the speedy handling of the fruit on arrival in England. The whole of the consignments, which will be shipped regularly each week until the middle of October, will be received this year by Messrs. PARSONS & Co., of Covent Garden. It is anti-

FIG. 69.—VIEW IN THE CONSERVATORY, WOOD HALL, SYDENHAM.

(See p. 142.)

[Photograph by John Gregory.]

co-partnership method of housing. At the previous gatherings, held at the Crystal Palace during the last 25 years, evidence has been given of the development of the co-partnership idea in industry as well as to housing. But it has been impossible to do more than to provide plans and models. The visitor to Hampstead will be able to see in bricks and mortar and in the display of well-kept gardens what has long been the ideal of housing reformers. The Co-partnership Tenants' Housing Council, of 6, Bloomsbury Square, London, may well be proud of the way in which their ideas have materialised in the Hampstead Garden Suburb. Only four years ago that district was absolutely free of dwellings. Now three co-partnership societies are working

rick, so that, if the disease is noted one year, all possible care should be taken to diminish the danger of infection from this source. This disease is seldom dangerous unless it attacks the Beans at a very early stage, and in parts of Worcestershire, where the trouble used to be serious, it has been almost completely prevented by sowing winter Beans. Where this disease has done damage during 1911 early sowing is strongly recommended for later years.

CANADIAN PEACHES AT COVENT GARDEN.—From information supplied us at the instance of the Chief Agent for the Ontario Government, it appears that September will witness the arrival of large consignments of Canadian Peaches. Only

pated that the first shipment will arrive about September 10.

THE MODERN MILK PAIL.—The vigilant eye of the New York Agricultural Experiment Station has fallen on and condemned the old-fashioned milk pail. It is estimated that half the infection which milk receives during the milking process may be prevented by the use of a covered pail. The milkmaid is advised without delay to hie herself to a tinsmith and bid him fix a cover to her pail with an opening of 5-7 inches in diameter. She will soon get used to the new contrivance, and it will keep out many of the microbes which spoil the milk and at times set up disorders in the consumers thereof.

EDUCATION TRAINS.—We reproduce two photographs showing the education trains which are despatched periodically on tours by the authorities of the Agricultural Experiment Station of Purdue University, Indiana. Fig. 70 shows the special education lecture train ready to start, and in fig. 71 are to be seen the "farmers rushing to the cars to hear lectures." The railway companies, recognising the importance of agricultural education to the farmers of the state, give

FIG. 70.—"EDUCATION" TRAIN READY TO START.

special facilities for this novel method of instruction. During the past year two special trains were run, a "Wheat train" (August 22 to September 7), which provided information to no fewer than 14,700 persons, and a "Corn train," despatched on April 25, which provided lectures for 5,000 people. Further particulars of these education or "demonstration" trains were printed in our issue for April 2, 1910.

HOOKE'S ICONES PLANTARUM.—This work, founded in 1837 by the late Sir WILLIAM J. HOOKER, has now reached the second part of the 30th volume, and includes 2,950 plates. The *Botanical Magazine* has served to illustrate the

tributed 1,500 illustrations. The present number contains illustrations of many new genera or genera recently published elsewhere, but not previously figured. Among them are three genera of Grasses described by Dr. STAFF, and four of Ericaceae described by Mr. N. E. BROWN. The latter are all allied to Erica itself, and all have very small flowers. Those of Eremiopsis are only about $\frac{1}{8}$ inch long. Platycalyx is an exceedingly slender little shrub, 2 to 3 inches high, with

minute flowers, clustered at the tips of the branches. Aniserica is characterised by having a two-lobed tubular corolla and exserted stamens, with bipartite anthers. Lepterica is remarkable for its densely-crowded, slender, parallel branches, and minute flowers with a one-celled, one-ovulate ovary and large, peltate stigma. There is a good figure of the interesting South African Bamboo, *Arundinaria tessellata*. *Brachylæna Hutchinsii* is remarkable in being, we believe, the largest or tallest of arboreal Compositæ hitherto described. It is a native of British East Africa, and its height is given as 27-30 metres, equal to 90-100 feet. Some

FIG. 71.—FARMERS ENTERING THE "EDUCATION" TRAIN.

new cultivated plants of Kew, and the *Icones* consists of black-and-white figures of herbarium specimens of plants of economic or botanic interest. From the first the parts were issued at irregular intervals, and there have been intervals of years' duration; but now that it is published at the cost of the Bentham trustees, it appears more regularly. With few exceptions, the drawings have been made by two artists, the late W. H. FITCH and Miss M. SMITH, the latter having con-

of the plates of this number are very badly folded by the binder, showing one broad and one narrow margin. It may be interesting to mention that in the recently-published part of the *Flora Capensis*, containing the Ericaceae, 469 species of Erica alone are defined (not 5,000, as stated in a contemporary), and in addition there are 90 names of "obscure species" and 130 hybrids. Many of the latter are figured by ANDREWS and others as species.

A NEW GARDEN WORM.

THE observant gardener is well aware of the fact that different worms are found in different soils and situations. On the lawn one finds the small purple worm (*Lumbricus purpureus*, Eisen), and the turgid worm (*Allolobophora turgida*, Eisen). In heavy garden soil the long worm (*A. longa*, Ude), the blue worm (*A. profuga*, Rosa), or the yellow tail (*A. studiosa*, Rosa) are common. The true earthworm (*Lumbricus terrestris*, Linnæus), and the red worm *L. rubellus*, Hoffmeister, like richer soil, and may usually be found in old, well-cultivated gardens. In the manure heap one finds the brandling (*Allolobophora fetida*, Savigny), and in pastures, paddocks, and woody places around the mansion, other species occur. But if one examines the leaf-mould, which is so valuable an accessory to the manure heap, quite a different set of worms is to be found. Some of these vary so much from the typical *Lumbricus* and *Allolobophora* that they have been formed into another group of two or three genera, known as *Eisenia*, *Bimastus*, and *Dendrobaena*. The *Dendrobaenas* are so named from two Greek words, *Dendron*, a tree, and *Bainô*, I go; because they go or live in old decaying trees, or among rotting wood and debris. Many of these have long been well known because of their value in helping to break down useless vegetable matter, and make it fit for the food of other plants.

It is a new member of this group of annelids which I have to describe, and as it seems to be new to science, as well as to our British lists,

FIG. 72.—DENDROBAENA MERCIENSIS.

I call it provisionally *Dendrobaena merciensis*, Friend, because it was first found not far from Repton, the old capital of Mercia.

The new worm, like the other species of *Dendrobaena*, is a denizen of the leaf-mould, and is very similar in appearance to *D. subrubicunda*, Eisen, and some other native species. It may, however, be at once distinguished from these by the position of the girdle and the arrangement of the head.

The girdle begins on the 22nd, 23rd, or 24th segment, and extends to the 31st, where it seems always to end. No other species is found in England in which the girdle begins so near the head. In the case of one worm (for which I at first mistook the new species) we find the girdle beginning on the 24th or 25th, but this worm (*Bimastus Eiseni*, Levinsen) has the setae in pairs, and not widely separated, as is usual with the *Dendrobaenas*. There are no bands or pores (tubercula pubertatis) on the underside of the girdle, but each of the segments is clearly defined. On the back the girdle segments ultimately fuse, but the segments remain for a time sufficiently distinct to enable one to count them. Segments 22 and 23 are the last to fuse. The dorsal pores are large, and begin between the 4th and 5th segments; but ultimately disappear from the girdle when it fuses.

The colour of the upper surface of the body may be described as chestnut or warm brown, the ventral surface being without coloured pigment, and therefore of a yellowish or clayey hue. It is not iridescent like *Lumbricus* or *Bimastus Eiseni*, Lev., nor are the setae closely paired. The head, however, resembles that of these worms in that it entirely cuts the first ring, or makes a perfect mortise and tenon with the peristomium. In the words of Michaelsen, one of our greatest authorities on the subject, the head is tanylobisch. This, together with the absence of tubercula on the girdle, is a very rare feature in the *Dendrobaenas*, and

makes the present species easy of identification. Only one other British worm (*B. Eiseni*, Lev.), outside the genus *Lumbricus*, regularly has this peculiarity.

Besides the position of the girdle, the arrangement of the setae, and the shape of the head, one has the male pores for a guide in external diagnosis. In some cases (as e.g., *L. castaneus*, Savigny) these pores are invisible; in others (as *D. subrubicunda*, Eisen, and especially *D. mammalis*, Savigny) they are situated on such large papillae that the adjoining segments are affected. But if we look at the 15th segment of the new worm we find that while the pores are very distinct, and easily discovered, they are not seated on prominent cushions or papillae.

It is interesting to notice that different worms have their own peculiar modes of progression,

second only 50. In the latter case, however, the total length is nearly as great as in the former, since the segments behind the girdle are as wide as two ordinary rings, and have three annuli, the middlemost of which carries the setae. I have often observed that when a worm's tail has been accidentally shortened it compensates for the loss in this way, and it seems to suggest that each species of worm requires a certain average length of tail for its healthy economy. This may be easily understood if we remember that the food, in passing along the intestine, is constantly supplying the typhlosole with its nutrient matter. If the worm, therefore, were too short the food would not yield up all its stores of nutriment. We do not yet know enough about worms to be able to say whether the tail portion has different func-

mortice and tenon with the first segment, or "tanylobisch." The male pores clearly seen on segment 15, but without raised papillae. Dorsal pores begin between segments 4 and 5, large and clearly seen. Colour warm brown or chestnut dorsally, without pigment on the underside. Setae very difficult to find. N.B.—These researches are undertaken by the aid of a Government grant, and the present article describes the first new species of earthworm found since the grant was made. *Hilderic Friend*, 110, Wilmot Road, Swadlincote.

ORCHIS ITALICA.

THE members of this genus of terrestrial Orchids are somewhat disappointing plants for pot culture as they are seldom satisfactory after the first season. However, if fresh tubers are obtained and potted in somewhat heavy loam, some species develop strong growths and handsome inflorescences. *Orchis italica* (see fig. 73) is one of the handsomest members of the family, and a well-flowered specimen in a pan forms a striking object when in bloom in a cold greenhouse. The species is a native of southern Europe, where it is found growing on calcareous hills; it belongs to the same section of the genus as our native *O. militaris*. In general habit and appearance it is similar to that plant with the exception that the divisions of the lip in the flower are much longer in *O. italica*. The flowers are a long time in developing, and last through May and June in a good condition. The stout stems reach to a height of from 1 foot to 1½ foot, and bear dense spicate heads of pale-purple flowers sometimes with darker spots. The leaves are long and undulated. *O. italica* is also known as *O. longicruris* and *O. undulatifolia*. Tubers planted out in the rock garden at Kew did not succeed so well as those grown in pots in a cold frame, for the young leaves were damaged by cold winds in spring. W. I.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ROSE "JULIET."—I was much interested in Mr. Parker's note on this Rose (see vol. xlix., p. 382), and was anxious to see flowers of Juliet grown in Scotland. Your correspondent states that having been with the raisers at the time of its distribution, he had every opportunity of observing its habits and flowering qualities. May I ask Mr. Parker what his experience was with this Rose when he was in England, so far as maidens are concerned? Here, in Mid-Lothian, we have some 50 plants, budded last season on the seedling briar, and each one is rushing to growth and not flowering. A similar experience must be recorded with maidens under glass in pots, and only cut-backs in the open are furnishing flowers. These cut-backs flowered fairly well, but owing to the hot, dry weather experienced here this summer, the colour combination has not been seen to advantage. All the flowers were quartered, no doubt owing to climatic conditions, and the plants yielded but few blooms. We shall get a few autumn flowers, and with cooler and more favourable weather the colour will perhaps be seen in better character. So far Juliet is not a Rose for Scotland, but it is premature to condemn or praise it in these latitudes, as it has had by no means a fair trial. As shown in England by the raisers, it is a most remarkable flower, and I hope cut-backs will give us good results another season. One charming quality of this Rose is the delightful fragrance of the young foliage. I note that your correspondent says that gardeners who wish a "frost-proof" Rose should give Juliet a trial. Will Mr. Parker say where he gained the experience to warrant this statement? Has he actual proof of the hardiness of the variety? Judging from its wood and general character, Juliet seems to be a variety that hardly justifies this assumption, but no doubt this winter will test it in Scotland. Juliet is a splendid acquisition to the garden, and we all wish to see it do well. *George M. Taylor, Mid-Lothian.*

FIG. 73.—ORCHIS ITALICA: COLOUR OF FLOWERS PALE-PURPLE.

and are characterised by different degrees of activity. The green worm (*A. chlorotica*, Savigny) is, perhaps, the most sluggish species found in England. The purple worm and one or two others go backwards as gracefully as a courtier leaving a drawing room. But the species I am describing has a habit which is not common among English worms, though often met with among certain foreign species, of doubling itself like a fish about to leap, and then with a rebound jerking itself to a considerable distance. We as yet know too little about the habits of worms to speculate as to the cause or origin of such a habit as this.

The total number of segments in the body varies. One specimen contains 110, but a

tions from the central part, but it is clear that each species of worm has a certain average length or number of segments and that this is in some way a necessary part of its economy, just as in other animals the length of certain tubes, channels, and organs is characteristic of the genus or species.

I have not been in the habit of dealing in these articles with the internal organisation of worms, as the discussion of such details is best reserved for journals of a different character. I may, therefore, close this description by a brief summary of the facts which I have supplied. *D. merciensis*, Friend: length, 2 inches to 3 inches, about 100 segments, girdle on 22nd-31st without tubercula. Head forming a perfect

FLOWERS IN KENSINGTON GARDENS.—I was pleased to read Mr. Lee's remarks in the issue for August 12, p. 114, on Kensington Gardens. The Lily tank in the Dutch garden is, as he justly observes, very beautiful at this season, and the Water Lilies are flowering freely, with groups of Bulrushes and Irises between them. Roses around have been making a grand display, whilst in the surrounding borders are good groups of *Viscaria splendens*, *V. picta*, *Salpiglossis* of a fine strain, *Antirrhinums*, *Petunias*, *Campanulas*, *Begonias*, *Nasturtiums*, and *Zinnias*. The trees forming the covered way are making good growth, and the whole gardens present a fine, natural picture, full of repose and quiet beauty. In the beautiful and popular "Flower Walk" near to the Albert Memorial, are fine groups of *Heliotrope*, *Fuchsia*, *Calceolaria*, *Plumbago capensis*, *Antirrhinum*, *Viscaria*, *Coreopsis*, *Pentstemon*, *Verbena*, and *Trachelium*. J. B.

LONDON VEGETATION AND THE DROUGHT.—I have just returned to London after several weeks absence in the country, where I was impressed by the great damage caused by the drought to trees and shrubs, many fine trees of various ages everywhere being apparently quite dead. On returning to London, however, I see vegetation looking quite green and flourishing, although it is the end of August. I was particularly impressed by the rich green foliage of the London Plane, the Poplar, the Ash, and, above all, the glorious Fig. The Squares in which I see these very favourable specimens of successful arboriculture are Trafalgar Square, Golden Square, Leicester Square, Hanover Square and Cavendish Square. The Fig is especially fine in Trafalgar Square. Henry Holden, 3, Harwood Place, Hanover Square.

DWARF CHRYSANTHEMUMS.—Another method of raising dwarf Chrysanthemums besides that mentioned by J. R. on p. 5 in the issue for July 8, is by ringing. Select a shoot with a prominent bud on a specimen plant, and, in August or early in September, when the bud has begun to rise above the foliage, make the tongue in the stem about three or four internodes from the top. The tongue is made in the same way as in Carnation layering. Split a "60" pot in halves, which may be easily done by means of an old saw, and place the two halves together around the stem, securing them by means of a stake and string, as shown in fig. 75. Fill the pot with some light soil, which must be kept moist. In about three weeks roots will have formed, and the rooted part may then be cut off at the bottom of the pot, and transferred to another pot of the same size. The plants should be placed in a cold

plants less than a foot high may be raised in this manner. *Albert Nobbs, The Gardens, Gennings Park, Maidstone.*

THE POTATO CROP.—Although the prospects for a good Potato crop were not favourable early in the season, the yield will prove more satisfactory than was anticipated. The plants were

FIG. 75.—PROPAGATING DWARF CHRYSANTHEMUMS BY "RINGING."

checked early in the summer by excessive heat and dryness, followed by a brief spell of cold weather, and in many localities even frost sufficiently severe to cut back the tops. But the Potato enjoys warmth, and strong-growing main-crop varieties seem to have been benefited by the heat. Early varieties matured prematurely, giving a small crop of medium-sized tubers, but later varieties, where the soil has been deeply worked and enriched with manure, retained their foliage green and vigorous to an unusual degree. No

FIG. 74.—GROUP OF DWARF CHRYSANTHEMUM PLANTS OBTAINED BY "RINGING."

frame for a few days, and afterwards removed to a shelf in a greenhouse near to the glass. By this method splendid plants may be had, ranging in height from 9 to 18 inches. Those shown in fig. 74 were grown in this manner. By a careful selection of varieties that have short flower-stems,

doubt the broad, spreading haulm by shading the ground has assisted in the retention of what little moisture there was in the soil by preventing evaporation, and it is noteworthy that, however dry and hot the weather may be, the leafage of Potatoes does not flag. After nearly eight

weeks of heat and drought many breadths of late Potatoes appear healthy and vigorous. But the marked feature of the Potato crop is the general absence of the fungus disease, *Phytophthora infestans*. Has the great heat and dryness so far prevented the disease spores from making growth, and are they but lying dormant ready to become active when rain falls? Although there may not be a heavy crop, the tubers are free from disease, exceedingly well matured, and the plants are sturdy. Generally Potatoes seen at exhibitions this year have been remarkably good. A. D.

SOCIETIES.

ANNANDALE HORTICULTURAL.

AUGUST 12.—The annual show of this society, which is held alternately at Annan and Lockerbie, took place on this date at the latter place. The show compared favourably with the one held last year. Sweet Peas were unusually good, vegetables formed an important feature, whilst, in the fruit section, exhibits of Grapes were very fine. In the open classes for pot plants the most successful exhibitor was Major CRITCHLEY, Stapleton Tower (gr. Mr. W. Niven), his chief competitors being Mr. J. WILSON, Eskrigg, and Mr. W. ANDERSON, Collin. Major CRITCHLEY also won several 1st prizes in the section for cut flowers, other winners being J. DAVIDSON, Esq., Summerville (gr. Mr. Jas. Wilson); Mr. J. TWEEDIE; Mr. J. HODGSON, Mount Annan; Mr. D. WHITELAW, Locharbriggs; Mr. T. G. GRIERSON and Mr. W. ANDERSON, Collin. Mr. G. L. MOFFAT, Lockerbie, won the 1st prizes in the Sweet Pea classes.

In the vegetable classes the leading prize-winners were Mr. J. DAVIDSON, Summerville; Major CRITCHLEY; Mr. W. ANDERSON, Collin; Mr. J. FRENCH; and Mr. A. CURRIE.

The principal prize-winners in the fruit classes were J. MAITLAND HERIOT, Esq., Hetland (gr. Mr. J. Hiddleston); Major CRITCHLEY; J. DAVIDSON, Esq.; Mr. J. WILSON, Eskrigg; and Mr. J. HODGSON. Major CRITCHLEY led in the class for a collection of fruit.

BRITISH PTERIDOLOGICAL.

THE annual meeting of the members of this Society was held recently at Barnstaple. Former meetings have been held either in the Lake District or Scotland, but Barnstaple was selected this year, with a view to examining the Ferns in the southern counties of England. The weather throughout was most delightful, and the meeting was a success in every way. The business meeting was held at the Golden Lion Hotel, when the president, Mr. Alex. Cowan, occupied the chair. But several informal gatherings took place, and at these Mr. Cowan exhibited, on behalf of himself and Mr. Phillips, a large number of Fern fronds, these embracing some remarkably fine varieties. These included a splendid form of *Osmunda regalis undulata*, found by Mr. Phillips, and far excelling in foliose character an otherwise similar variety of that name found many years ago in the Azores; and *Lastrea dilatata crispa ochracea*, with beautifully crisped frond, liberally and constantly splashed with golden yellow. Another very fine variety was a sub-plumose form of *Lastrea Filix mas*, of a very promising type for cultural selection. Excursions were made to Woody Bay, Hedensmouth, and other districts in the locality, but, owing to the drought, the Ferns in many places were scorched and their growth so stunted as to mask any varietal characters they may have possessed. Dr. Stansfield, however, found a plant of *Asplenium adiantum nigrum* with multifid frond tips throughout, and some very foliose forms of *Lastrea montana*. Mr. Druery, among other minor finds, discovered a Hartstongue resembling *lobatum*, but with all the frond terminals symmetrically rounded off with sori radiating around the abruptly-shortened mid-rib like the figures on a clock dial, a rare variant, which he named *Scolopendrium vulgare lobatum radiosorum*. Mr. W. B. Cranfield met with most success, alighting upon two remarkably fine varieties, one a wild deltoid foliose form of *Lastrea Filix mas* with broad dilatata-like basal pinnae, and the other, found on private ground, a peculiarly fine foliose and imbricate variety of *P. aculeatum* which had been found many years ago near Holsworthy.

SHROPSHIRE HORTICULTURAL.

Exhibition at Shrewsbury, August 23 and 24.

THE 37th annual summer exhibition of this Society was held on Wednesday and Thursday last in the Quarry Grounds, Shrewsbury. The general disorganisation in the railway world had its effect on the show, and fears were entertained, as late as last Sunday, that a postponement would be necessary. But although the tents were scarcely filled so well as usual, the failures were not nearly so numerous as might have been expected, thanks to the secretaries, Messrs. H. W. Adnitt and W. W. Naunton, who put forth every effort to overcome the difficulty. How far the attendance of visitors was influenced by the railway unrest it is impossible to say at the time of writing, but everything points to a much smaller gate than usual. At 5.30 p.m. on the first day the receipts were considerably below the average. Taking the show all round, it was a good average display, in spite of the difficulties already referred to and the long period of drought, which has affected all outdoor crops, hastening the season of many, and generally reacting injuriously on others, especially of flowers and vegetables. The quality of the exhibits showed little deterioration from this cause, if we except Sweet Peas and Roses. Dahlias were finer than usual, the season suiting them; the hot weather has also favoured the production of intense colour in indoor foliage plants, whilst fruits have rarely been seen in better condition. The new class of last year was slightly modified, and this season indoor flowers were not permissible, but the class was arranged for a group of hardy herbaceous and perennial flowers with rockery and pool of water. In the 1st prize exhibit a free use was made of cut flowers, and these were arranged too thickly together. The 2nd prize group was crude in arrangement and the flowers were overcrowded. Aquatics, with the exception of a few varieties of Nymphaeas, were not well represented. More room should be given another year to this class, for with greater scope, better effects could be produced. Mr. Naunton, we were pleased to observe, was present as usual, and appeared to have quite recovered from his recent illness.

DECORATIVE FRUIT CLASSES.

The Shrewsbury shows have a reputation for the extent and quality of the fruit exhibits, and the first class in this section is justly allotted to the decorated fruit tables. These always represent the highest efforts of some of the best fruit-growers in the country, and the competition is always of the keenest. The schedule requires 30 dishes of ripe fruits, in not fewer than 10 distinct kinds. The exhibitors are allowed to select the varieties, but not more than 14 bunches of Grapes are permitted, and these must be shown in at least four varieties to include both black and white varieties. It is further stipulated that not more than four varieties of any one kind of fruit may be included, nor more than two dishes of one variety. A list of fruits permitted with the maximum number of points each may receive is given in the schedule as follows:—

	No. of Points.
6 Apples	7
9 Apricots	6
50 Cherries (about)	5
9 Figs	7
Grapes are pointed as in class for 12 bunches.	
1 Melon (each fruit)	8
8 Nectarines	8
8 Peaches	8
6 Pears	8
12 Plums	6
50 Strawberries (about)	6

Any kind of fruit not mentioned above to receive a maximum of six points. Each collection

may be decorated with flowering and foliage plants, the points for these being beauty of flower and foliage 6, and general arrangement for effect 6. The 1st prize consists of a silver champion cup, valued at 25 guineas, and £20 in cash, the cup to become the property of any competitor who wins it three times (not necessarily in succession). The exhibits numbered four, one less than last year, and all the exhibitors are to be congratulated on their splendid produce. It required a critical observation on the part of the judges to determine the merits of the respective displays, and judging was not completed until 12.30. The 1st prize was awarded to the Duke of WESTMINSTER, Eaton Hall (gr. Mr. N. F. Barnes); having won the cup on two previous occasions, it becomes his absolute property. In the opinion of many the collection was one of the finest ever shown at a Shrewsbury exhibition. The Grapes included one of the best bunches in the show, a superb example of Muscat of Alexandria, shapely, large in berry, and bearing fine colour. Madresfield Court was also shapely and beautifully finished. Other choice dishes were Nectarine Humboldt, Plum Transparent Gage, Peach Royal George, Apples Cox's Orange Pippin (a splendid dish of this superb variety), and Gascoyne's Scarlet Seedling (the fruits being magnificently coloured), Melon Scarlet Flesh, Fig Brown Turkey, and Morello Cherries.

The dishes were as follows, and the number of points obtained for each dish is appended:—
Apples: Cox's Orange Pippin, 6½; Emperor Alexander, 6; Gascoyne's Scarlet Seedling, 6; Cox's Orange Pippin, 6½. *Cherries*, 4. *Figs*, 6. *Grapes*: Muscat of Alexandria, 9½, 9, 9, 8½; Chasselas Napoleon, 5½, 7; Appley Towers, 7½, 8½, 8, 8½; Madresfield Court, 9, 8½, 8, 8. *Melon*, 6, 6, 7, 7. *Nectarines*: Humboldt, 7½, 7½; Pineapple, 7½, 7½. *Peaches*: Belle Baucé, 7; Dymond, 7; Royal George, 7½, 7. *Pears*: Doyenné du Comice, 7; Marguerite Marillat, 7½; Triomphe de Vienne, 7; Marguerite Marillat, 6½. *Plums*: Transparent Gage, 5. *Beauty of flowers and foliage*, 6. *General arrangement for effect*, 5½. Total number of points awarded, 278½. The 2nd prize was won by the Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre), who was awarded 258½ points. Apples gained 21½ out of a possible 28 points, and Grapes 120½ out of a possible 143. Ribston Pippin was the best Apple, gaining six points, the next best dish being Peasgood's Nonesuch, which obtained 5½ points. The finest Melon was a fruit of Hero of Lockinge; Pineapple and Humboldt were the choicest Nectarines; Thomas Rivers, the best Peach; and Souvenir du Congrès and Williams's Bon Chrétien the best Pears. 3rd, J. H. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker), with 238½ points. Apples of exceptional size were shown in this collection: his fruits of Cox's Orange Pippin, which were awarded the maximum number of points, must have weighed half a pound apiece. 4th, Lady HENRY SOMERSET, Ledbury (gr. Mr. G. Mullins).

COLLECTIONS OF FRUITS.

There were two classes for collections of fruits, the more important being for 12 dishes. The conditions of the schedule in the larger class required 12 distinct varieties in not fewer than nine kinds, and not more than two varieties of a kind. Black and White Grapes were regarded as distinct kinds, and two bunches of each variety constituted a dish. Each collection was required to be decorated, for which separate prizes were offered. There were five exhibits compared with seven last year. The quality, however, was superior to last season. The premier prize was awarded to the Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker). The dishes were Humboldt Nectarines, Dymond Peaches, Ribston Pippin Apples, Brown Turkey Fig, Transparent Gage, Triomphe de Vienne and Souvenir du Congrès Pears, Sut-

ton's Scarlet and yellow-skinned Seedling Melons, and Black Hamburg, Muscat of Alexandria and Madresfield Court Grapes. Taking them in detail the Grapes were excellent, the two bunches of Madresfield Court being almost perfect, splendidly coloured, well matched, and with heavy bloom, denoting high finish. The bunches of Black Hamburgs were large, and the berries well developed; one being especially well finished. The berries of Muscat of Alexandria were small, but of a rich, amber colour, and in the best condition for the table. The dish of Triomphe de Vienne Pear was outstanding amongst the other kinds, the fruits being of magnificent quality. Dymond Peaches and Transparent Gages left little to be desired, whilst the Apples were also very good. The 2nd prize for decoration was awarded to this exhibit. The 2nd prize collection of fruit was shown by Lord BIDDULPH, Ledbury Park (gr. Mr. H. Cotton). His Gros Maroc Grapes were a feature, but the bunches of Muscat of Alexandria were small and unripe. Madresfield Court was moderately good, and Duke of Buccleuch fine of berry, but the bunches none too shapely. Pineapple Nectarines were splendid, being large, and coloured to a high degree. Brown Turkey Figs, Souvenir du Congrès Pears, and Bellegarde Peaches were also very choice fruits. Besides these were Kirke's Plums, a Seedling Melon, and Lady Sudeley Apples. The 1st prize for decoration was awarded to this group, the subjects employed being pink Carnations, Lilium lancifolium and Francoa ramosa, with suitable grasses and greenery. 3rd, Mrs. F. NEED, Great Malvern (gr. Mr. J. Jones), who showed splendid Grapes of Appley Towers and heavy bunches of Gros Maroc. The bunches of Muscat of Alexandria were mediocre, and unevenly matched. Brown Turkey Figs were specially good, and Peaches and Nectarines very highly coloured. 4th, Lord BELPER, Derby (gr. Mr. W. H. Cooke).

There were six entries in the class for nine dishes, double the number of last year. The 1st prize was won by Capt. HEYWOOD LONSDALE, Shavington Hall (gr. Mr. J. Mills), whose fruit was on the small side, but of splendid quality, including high finish. The Grapes were Madresfield Court and Muscat of Alexandria, of which the black variety was the better. Allington Pippin Apples were large and highly coloured, with a good bloom; a good dish of Nectarine Peach, a seedling Melon, Pear Marguerite Marillat, rather small Nectarines of Pitmaston Orange and Stanwick Elruge varieties, and moderate Peaches of Bellegarde variety completed the collection. The 2nd prize was awarded to Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts). Melons were good in this exhibit. Black Hamburg Grapes possessed extra large berries, and Buckland Sweet-water exhibited a fine amber colour, but Lord Napier Nectarines were over-ripe and bruised, whilst Dr. Jules Guyot Pears were inferior. There was an excellent dish of Noblesse Peach. 3rd, A. H. HEBER PERCY, Esq., Hodnet (gr. Mr. W. Catt), with good produce, stone fruits being of splendid quality, and Grapes being his weakest dishes. 4th, Col. ISACSON, West Felton (gr. Mr. W. Willdig). The prizes for decorations in this class were awarded as follow: 1st, A. H. HEBER PERCY, Esq., Hodnet (gr. Mr. W. Catt); 2nd, Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts).

GRAPES.

Twelve bunches of Grapes in four or more distinct varieties, but not more than four bunches of any one variety.—The bunches were to be staged on boards and the whole arranged on a table space measuring 8 feet by 4 feet 6 inches, in two tiers 2 feet 3 inches wide. Each bunch was to be judged on its individual merits and the points awarded marked on cards and placed on the tables after the judging was finished.

There were ten exhibits, compared with six last year, and the general quality of the Grapes was good, although not exceptional. In a keen

competition the 1st prize was awarded to the Duke of NEWCASTLE, Worksop. This exhibitor gained 101 points, awarded as follows:—

No. of Bunch.	Variety of Grape.	Points Awarded.	Possible No. of Points.
1	Muscat Hamburg	7	10
2	Muscat of Alexandria	8½	11
3	Madresfield Court...	9	10
4	Black Hamburg	9	10
5	Muscat of Alexandria	8½	11
6	Muscat Hamburg	8	10
7	Muscat Hamburg	8	10
8	Muscat of Alexandria	9	11
9	Madresfield Court	8½	10
10	Madresfield Court	8½	10
11	Muscat of Alexandria	8½	11
12	Madresfield Court	8½	10
Totals ...		101	124

It will be seen that no bunch was awarded the maximum number of points; the Madresfield Court and Black Hamburg varieties were the best, and generally the black Grapes were the finest, Muscat of Alexandria, although well finished in berry, being unexceptional in size of bunch or berry. Madresfield Court was splendid in quality, and was only lacking in size of bunch. The 1st prize for decoration was also awarded to this exhibit.

Only half a point separated the 2nd prize exhibit, which included much larger bunches, but less perfectly finished. The exhibitor was Lord ROWALLAN, Rowallan, Ayr (gr. Mr. J. Dixon). The fruits of Muscat of Alexandria were green, but the Muscat Hamburg were splendid, and one bunch was awarded the maximum number of points. This splendid bunch was the subject of general comment. There was a companion bunch, but this was less perfectly finished, although equally large. Madresfield Court was excellent, and the fruits only needed a little longer time for perfect ripening.

No. of Bunch.	Variety of Grape.	Points Awarded.	Possible No. of Points.
1	Muscat Hamburg	6½	10
2	Muscat of Alexandria	8	11
3	Black Hamburg	8	10
4	Madresfield Court	8½	10
5	Muscat of Alexandria	7½	11
6	Muscat Hamburg	8½	10
7	Madresfield Court	8½	10
8	Black Hamburg	9	10
9	Black Hamburg	8½	10
10	Muscat of Alexandria	8½	11
11	Madresfield Court	9	10
12	Muscat Hamburg	10	10
Totals ...		100½	123

The Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre), who gained the 3rd prize, was awarded 99 points. This exhibitor showed Black Hamburg uniformly well and gained 27 points out of a possible 30 for this variety. 4th, J. H. DRAKES, Esq., Market Rasen (gr. Mr. W. Parker). 5th, Miss WEBB, Newstead Abbey (gr. Mr. T. Ireland). 6th, Lord BELPER, Derby (gr. Mr. W. H. Cooke). The 2nd prize for decoration was awarded to Miss WEBB, Newstead Abbey (gr. Mr. T. Ireland).

Collection of four bunches.—There were four entries in this class, the 1st prize being awarded to the largest bunches, shown by Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert). Muscat of Alexandria were long and tapering and Madresfield Court heavy, but none too shapely and the berries rather small. The 2nd prize was awarded to C. TANGYE, Esq., Knowle (gr. Mr. W. Wilkins), whose bunches were large but unripe, the berries of Madresfield Court being quite red. 3rd, Lord TREVOR, Brynkinalt, Chirk (gr. Mr. W. Dawes), whose bunches were quite ripe but small.

The following classes were for two bunches of one variety:—

Black Hamburg.—This popular Grape was shown by six exhibitors. The Duke of NEWCASTLE had bunches of good average quality, and they obtained the 1st prize. The 2nd prize was awarded to the Earl of HARRINGTON (gr. Mr. J. H. Goodacre) for an almost companion pair of bunches to the Duke of NEWCASTLE's. 3rd, Col. FRANCE HAYHURST, Middlewick (gr. Mr. A. H. Hall).

The 1st prize in the class for a single bunch of Black Hamburg was won by Mr. DRAKES (gr. Mr. W. Parker).

Black Muscat varieties.—The 1st prize in this class was awarded to the variety Madresfield Court, shown by Col. FRANCE HAYHURST, Middlewick (gr. Mr. A. H. Hall), the bunches being of average size and very deep in colour. 2nd, J. DRAKES, Esq., with larger bunches of the same variety, having less perfectly ripened berries. 3rd, Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), with Muscat Hamburg.

Madresfield Court.—It was an easy matter to select the 1st prize bunches in the class for this popular Grape, those shown by Col. FRANCE HAYHURST (gr. Mr. A. H. Hall) being easily the best. The 2nd prize was awarded to the Duke of NEWCASTLE (gr. Mr. S. Barker), for a well-matched pair of bunches, perfect in berry, but on the small side. 3rd, Mr. W. H. FAULKNER, West Kirby.

Black Alicante.—There were six exhibits of this variety, and again Col. HAYHURST won the 1st prize, although he had a keen rival in Mr. DRAKES, finish of berry being the deciding factor. The Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker), was placed 3rd.

Any other Black Grape.—There were seven entries forthcoming in this class, and here Miss WEBB, Newstead Abbey (gr. Mr. T. Ireland) excelled with bunches of the large variety Barbarossa, sometimes known as Gros Guillaume; 2nd, Mr. DRAKES, with Black Alicante; 3rd, Duke of NEWCASTLE, with Gros Colman.

Muscat of Alexandria.—This class produced a good contest amongst nine competitors, but no exhibit was finer than might be expected in such a favourable season. The pair of bunches exhibited by the Duke of WESTMINSTER were decidedly good, being well matched, and possessing berries of good colour. The 1st prize was awarded for these, the 2nd prize being won by Mr. J. DRAKES. The best single bunch of Muscat of Alexandria was also shown by the Duke of WESTMINSTER, and Mr. DRAKES was 2nd.

Any other White Grape.—In a moderate competition the 1st prize was won by J. BUCHAN, Esq., Huyton (gr. Mr. W. Oldham), with the variety Buckland Sweetwater; 2nd, G. A. GIBBS, Esq., M.P., Bourton (gr. Mr. Wilkinson), with the same variety.

Heaviest Bunch of Grapes.—The Duke of NEWCASTLE won the 1st prize in this class with a bunch weighing 7 lbs. The variety was not named, but it was apparently Barbarossa. 2nd, Col. FRANCE HAYHURST, with a bunch of Black Alicante, weighing 5½ lbs.

LOCAL GRAPE CLASSES.

There were five classes for Grapes cultivated in the county of Shropshire. The awards were made as follows: **Black Hamburg:** 1st, Captain HEYWOOD LONSDALE, Shavington Hall (gr. Mr. J. Mills); 2nd, Col. M. ISACSON, West Felton (gr. Mr. W. Willdig). **Madresfield Court:** 1st, Capt. HAYWOOD LONSDALE; 2nd, Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert). **Any other variety of black Grape:** 1st, Lord HARLECH, with Alnwick Seedling; 2nd, Mrs. F. ALDERSON, Oswestry (gr. Mr. G. Davies), with Black Hamburg. **Muscat of Alexandria:** 1st, Lord HARLECH; 2nd, Capt. HEYWOOD LONSDALE. **Any other variety of white Grape:** Mrs. F. ALDERSON, Oswestry (gr. Mr. G. Davies), won the 1st prize in this class with Buckland Sweetwater.

OTHER KINDS OF FRUIT.

Peaches.—These fruits, also Nectarines, were of exceptionally high colour. The largest fruits of Peaches, shown by Sir C. A. SMITH, Bart., Bangor (gr. Mr. H. Weaver), were awarded the 1st prize, the variety being unnamed, but it was apparently Bellegarde. 2nd, Barrington, shown by Duke of WESTMINSTER. There were 12 competitors in this class.

Nectarines.—Amongst 11 competitors, the Duke of WESTMINSTER won the premier prize with magnificent fruits of Pineapple. 2nd, Lady HENRY SOMERSET with the same variety.

Apricots.—In a season of great scarcity of these fruits it was not surprising to find only two exhibits. The 1st prize was awarded to Lord HARLECH for fruits below the average quality.

Melons.—There were 13 green-fleshed and 15 scarlet-fleshed Melons. The best of the former type was shown by W. J. LEGGE, Esq., Madeley (gr. Mr. J. Stalker), and of the latter by Col. CORNWALLIS WEST, Ruthin (gr. Mr. H. Forder); in both cases eating quality was the only consideration. The best white-fleshed Melon was shown by Lord BELPER, Derby (gr. Mr. W. H. Cooke).

Plums.—The best Gage Plums were Transparent Gage, shown by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), the best Yellow Plums, Washington, shown by the Marquis of NORTHAMPTON, Castle Abbey (gr. Mr. A. R. Searle); and the best purple or red Plums, Victoria, shown by Dr. RAMBAUT, Bicton Heath (gr. Mr. Jones).

Cherries.—Amongst eight dishes of Cherries, all of the Morello type, the best was shown by Mr. W. H. FAULKNER, West Kirby.

Six dishes of hardy fruits.—This class and five other classes for fruits were restricted to growers in the county of Shropshire. The 1st prize for six dishes was won by Mrs. F. ALDERSON, Oswestry (gr. Mr. G. Davies), who showed Morello Cherries, White Currants, Jargonelle Pears, Lane's Prince Albert Apples, and Gooseberries.

GROUPS OF PLANTS.

On the whole, we must confess to a feeling of disappointment with the group classes. There was too strong a family likeness in the exhibits shown in the principal class. In each case there was practically the same archway at the back. The body of the group consisted of raised Crotons—fine plants, triumphs of cultural skill—rising from a groundwork of stove and greenhouse plants. Whilst the style of arrangement in one instance would be very pleasing and would command attention, yet when repeated, with but slight variations, three or four times, it fails to please. The new group class, first included last year, which permits the use of cut flowers of any kind and requires a rockery, pool of water, &c., was not strongly contested. As this style of grouping should be as different as possible from the older-established method of arrangement, larger pools of water would probably be advantageous.

Messrs. J. CYPHER & SONS, Cheltenham, exhibited the best group of miscellaneous plants in and out of bloom, arranged to produce the best effect, and occupying a space of 250 square feet. For brilliance of colour, richness of foliage and tasteful arrangement it would be difficult to imagine anything superior to this beautiful group. Splendid, single-stemmed Codiaums, bearing perfect leaves of rich colour and graceful form, rose at studied, yet informal, intervals. Cork-covered stands were planted with just the right numbers of less showy plants as Ferns, which served as an admirable foil to the tropical colouring. In the groundwork of bright foliage, and cool, green Ferns, were intermingled spikes of Cattleyas, whilst sprays of Oncidiums added lightness and grace. At the background a nearly flat-topped archway, composed of virgin cork, had all the appearance of antiquity. Trails of Vitis heterophylla variegata drooped gracefully in company with a few medium-sized Codiaums. At the very back a fine Seaforthia elegans added a dignity, and the arched leaves served to render this charming group complete and finely balanced. 2nd, Sir G. H. KENDRICK, Whetstone, Edgbaston (gr. Mr. Macdonald), with a group of finely-grown plants of very similar style of arrangement to the 1st prize exhibit. Here the raised plants at the front were just a trifle too tall, and somewhat obstructed the view. In looking at this display of splendid plants one felt a strong desire to be able to stand 15 to 20 feet away, from which standpoint the effect would have been admirable. At the back a fan Palm was very ornamental. The tall Codiaums were exceedingly fine and highly coloured. Towards the back, half-a-dozen plants of Ixora Duffii with immense trusses of bloom supplied very rich colour. The margin of the group was nicely broken, and composed of suitable plants. 3rd, Mr. W. R. MANNING, Dudley. This was a graceful and nicely-balanced group, arranged in the usual fashion. As compared with the superior exhibits, this collection lacked colour. Mr. W. VAUSE, Leamington, staged a group that contained many charming and well-grown plants, and so impressed the judges as to receive an extra award.

The new class of last year was for a group of hardy herbaceous and perennial plants and flowers,

with background of decorative plants, Bamboos, &c., with rockery, pool of water, Nymphæas, water plants, &c., arranged for natural effect; cut flowers allowed. To occupy a space not exceeding 250 square feet. Two exhibits were staged; others were entered, but, through the railway strike, these latter were not forthcoming. The 1st prize was awarded to Messrs. GUNN & SONS, Olton. The motif of this striking collection was a small pool of Nymphæas, bounded in front with a narrow, skilfully-planted rockery, flanked with tall Lilioms, and backed with brightly-coloured flowers, rising to graceful Bamboos. The frontal rockery, which contained suitable plants, looked as though it had been lifted from some old garden and placed in position undisturbed. — Lilioms, chiefly *L. auratum* and *L. speciosum rubrum*, and *Helenium* were the principal flowering plants used. These, arranged in bold masses, arrested attention, and the Japanese species heavily scented the air. 2nd, Mrs. SWANN, Halston Hall. Though the general scheme of this collection was good, yet too much material was employed in its execution, and it lacked brightness. If it could have been arranged out-of-doors during the hot weather we have just experienced, the cool greenness would have been highly appreciated, but the dull canvas roof of the tent required bright colours.

There were half-a-dozen groups in the county class. For the most part these were arranged on the same lines as in the open class, and in a few instances more skill was displayed. Smaller and lighter plants were so disposed as not to obstruct the vision, the 1st-prize arrangement being well balanced and attractive, containing well-grown plants. The exhibitor was Mr. HOWSON, Market Drayton (gr. Mr. Townsend); 2nd, Mrs. BURD, Shrewsbury; 3rd, Mrs. SWANN, Shrewsbury. The best six stove or greenhouse plants were shown by Lord HARLECH, *Ixora Duffii*, *Gloriosa superba*, and *Allamanda Schottii* being his best specimens; 2nd, Mr. J. FARRANT, Shrewsbury.

In the class for a collection of rock and Alpine plants, arranged for effect, Mr. J. R. HAYES, Keswick, won the 1st prize. This collection of rock and Alpine plants was very refreshing after the arrangements we have become accustomed to at the London shows. Mr. HAYES abandoned the conventional dabs of sandstone or rock, and nicely arranged his plants amongst small pieces of cork. The whole effect was very pleasing. Such arrangements on stagings had far better be frankly artificial rather than attempted natural effects. Many Ericaceæ were shown full of flower, such as *E. Mackaii plena*, *E. cinerea alba*, *E. vulgaris rigida*, and *E. Alportii*. 2nd, Messrs. CALDWELL & SONS, with a similar arrangement, but as more lowly plants had been used, a flatness resulted. *Oenothera pallida*, *Linaria alpina rosea*, *Veronica rupestris alba*, far superior to the type, and *V. spicata corymbosa* were shown in good form.

SPECIMEN PLANTS.

Messrs. J. CYPHER & SONS, Cheltenham, showed 15 huge plants, which were models of skilful cultivation, and were arranged in an attractive manner. Three tall Palms (*Kentia australis* and *Forsteriana*) occupied the back row, and the remaining plants had their bright colours harmoniously blended. The *Codiaeums* shown were *Countess* and *angustifolium*; these were exceptionally healthy, and the uppermost leaves were almost golden in colour. An immense *Statice profusa* was well set off by *Rondeletia speciosa major*, *Ixora Duffii*, and *Stephanotis floribunda*. Another *Ixora Duffii*, with immense heads of bright flowers, divided the *Stephanotis* from a fine *Clerodendron Balfouri*, and a well-flowered plant of the delightfully-scented *Allamanda grandiflora*. A third *Ixora Duffii*, *Allamanda nobilis*, and a rather smaller *Clerodendron Balfouri* completed this large exhibit. Mr. W. VAUSE, Leamington, won the 2nd prize with a collection that, standing alone, would attract much attention, but here, next to Messrs. Cypher's wonderful plants, it was unfortunately over-shadowed. Two fine *Ericas* and a beautiful specimen of *Tabernamontana* were the pick of the flowering plants.

Messrs. JAMES CYPHER & SONS also secured first place in the class for six stove and greenhouse plants. The most striking specimen was an immense *Statice intermedia*. *Rondeletia speciosa major* was well flowered, though a trifle

too closely tied; but as we well know this is a difficult plant to train to any degree of grace. Two plants of *Ixora Duffii* carried many heads of richly-coloured flowers. *Clerodendron Balfouri* was a perfect plant of its class, but some of the flowers of *Allamanda nobilis* were fading. 2nd, Mr. W. VAUSE, Leamington. *Bougainvillea glabra*, *Rondeletia speciosa major*, *Allamanda nobilis*, *Statice intermedia*, *Erica Macnabiana*, and *Codiaeum aigburthense*, of moderate quality, were the best plants in this exhibit. 3rd, Mr. W. R. MANNING, Dudley, with smaller plants; three of *Erica*, two of *Bougainvillea glabra*, and one of *Rondeletia speciosa major*.

Messrs. JAMES CYPHER & SONS again occupied the premier position in the class for 30 stove or greenhouse plants in pots not exceeding 10 inches. The plants, though of necessity of smaller size, were of the same high quality and clean culture that characterised the larger specimens. Some of the plants were miniature duplicates of those in the larger class. Other noteworthy examples were *Chironia ixifera* (a very useful plant for cool greenhouse decoration at the present season); *Ixora regina*, the flowers a pleasing shade of colour; *Codiaeum inimitabilis*, perhaps the most wonderfully-coloured *Croton* in the show, and the graceful-feathered *Phoenix Roebelinii*. Mr. B. CROMWELL, Hunt's Cross, Liverpool, who was awarded the 3rd prize, showed great taste and no little skill in the arrangement of his exhibit, which more nearly approached Messrs. Cypher's standard than did any other exhibit. In this collection we observed *Dipladenia amabilis*, with its bright-rose-coloured *Allamanda*-shaped flowers. *Alocasia Sanderiana* was also very good, especially when we consider the 2nd prize exhibits in Class 3. We were surprised to find that the judges did not consider this exhibit worthy of the 2nd prize. There was a third competitor.

The first prize for 12 stove or greenhouse plants in pots, not exceeding 15 inches, was awarded to Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert), for an exceedingly meritorious collection. The *Codiaeums* were graceful and well coloured, and the flowering plants consisted of *Gloriosa superba*, *Acalypha hispida*, *Clerodendron fallax* (a splendid plant), *C. Balfouri*, *Allamanda Hendersonii*, *Ixora Duffii* and *I. Williamsii*. Amongst the four *Codiaeums* shown *C. Andreanum* was especially good, whilst a good *Kentia Forsteriana* completed the 12 plants. Mr. W. R. MANNING, with smaller plants, which lacked the freshness and high colour of the foregoing collection, was awarded the 2nd prize.

The best exhibit of four exotic Ferns was shown by Capt. H. LONSDALE, Shavington Hall (gr. Mr. J. Mills). This exhibitor staged large plants of *Polypodium giganteum*, *Adiantum formosum*, *A. cuneatum*, and *A. cardiochlena*. 2nd, Major NEWILL, Admaston (gr. Mr. W. Ashwood).

For six *Dracenas*, the plants in the 1st-prize collection, shown by Lord HARLECH, were exceedingly well grown and of high colour, the varieties *Victoria*, *amabilis*, and *Lord Wolseley* being especially meritorious.

In a good competition, the 1st prize for four *Fuchsias* was won by Mrs. JOWETT; 2nd, Mr. J. MITCHELL, Chatsworth House.

Many large plants, bearing healthy foliage and numerous spikes of flower, were staged in the class for six double-flowered *Pelargoniums*. The 1st prize was won by Mrs. JOWETT, Kingston (gr. Mr. E. Bridge); and the 2nd by Messrs. H. CLIFF & SONS, Abbey Foregate. The best exhibit of six single zonal *Pelargoniums* was shown by Messrs. CLIFF & SONS; 2nd, Mr. HOWELLS, Belle Vue. Mr. J. HAMMONDS, Shrewsbury, excelled in the class for six tuberous-rooted *Begonias*, and Col. ROBINSON in that for 12 *Gloxinias*.

A class was provided for 12 plants for table decoration, to be shown in pots not exceeding 6 inches in diameter. All the plants exhibited were well furnished and of good quality, but in several cases their decorative value was depreciated by the colours of the paper used to drape the flower-pots. The prizes were awarded as follows:—1st, Sir G. H. KENDRICK; 2nd, Mr. NUTTALL-PRESCOT; 3rd, Mr. HOWSON, Market Drayton. Lord HARLECH exhibited the best group of 12 miscellaneous plants.

CUT FLOWERS.

The 10 classes for florists' arrangements of cut flowers constituted an admirable section of the show. Much taste and skill had been expended upon the different exhibits. The "Bouquets of Flowers" were exceedingly bright and well arranged.

Bride's bouquet with Orchids and two bridesmaids' bouquets (Orchids excluded) in a stated space.—1st, Miss E. E. TODD, Musselburgh. This was a very effective exhibit, in which, however, the tulle and silk ribbons, obtruded rather more than our taste admired. The bride's bouquet was composed entirely of Orchids, chiefly *Phalenopsis*, while the bridesmaids' bouquets consisted of pink Carnations, and in each case were relieved by trails of *Asparagus plumosus*. Mr. W. J. GARNER was placed 2nd with a very similar arrangement, but his Carnations lacked the brightness of those in the 1st prize exhibit. 3rd, Mr. J. KNIGHT, Wolverhampton.

The best single bride's bouquet was arranged by Mr. A. ADSHEAD, Gatley, Cheshire. It consisted of a shower bouquet of Orchids, *Pancreatium fragrans*, and *Lily-of-the-Valley*, with a few sprigs of white Heather "for luck." 2nd, Mr. GARNER.

The 1st prize for a bouquet of flowers was won by Mr. A. ADSHEAD, who made a very bright and attractive bouquet, using various Orchids (*Cattleyas*, *Oncidiums* and *Cypripediums*), with a few highly-coloured *Croton* leaves and *Asparagus plumosus*. 2nd, Mr. GARNER. This exhibitor showed the best bouquet of flowers, Orchids excluded, with flowers of *Gloriosa Rothschildiana*, and just a few *Croton* leaves and *Asparagus* tastefully blended.

SWEET PEAS.

In some instances these flowers had suffered from the drought and heat, but the leading exhibits were characterised by large flowers of fresh, distinct colours borne on long, strong stalks. The premier class for this popular flower made a very attractive display, although the number of exhibitors was very much smaller than last year. In each case much care and taste had been expended in the arrangements, so that the colours blended harmoniously.

In the class for 12 distinct varieties, Mr. G. L. MOFFATT, Lockerbie, was placed 1st. His display was much the best: the chief varieties were *Chas. Foster*, *Edrom Beauty*, *Geo. Herbert* and *Zephyr*. 2nd, Dr. RAMBAUT, Bicton.

Mr. G. L. MOFFATT excelled in the class for six distinct varieties. As in the previous class, this competitor's flowers were large and borne on stout stalks. 2nd, Mr. A. BRYDON. 3rd, Mr. D. WILLIAMS, Aberdare.

In the class for 18 distinct varieties, Col. CORNWALLIS WEST showed superior flowers to those of other exhibitors. All the sorts shown were well represented. The best were *Dazzler*, *Asta Ohn*, Mrs. Henry Bell, *Menie Christie*, and *Princess Victoria*. 2nd, Mr. W. H. BANKS. These flowers were very fresh, and also well arranged. *Kitty Clive*, Mrs. Routzhan Spencer and *Etta Dyke* are a selection. 3rd, Sir C. A. SMITH, Bangor (gr. Mr. H. Weaver).

ROSES.

Not only has the month of Roses long since passed, but the recent heavy rains following on a long period of drought have much affected the blooms. Consequently, the display of Roses was smaller than usual, and the individual blooms were not of high quality. There was only one competitor in the class for a collection. The exhibitors were Messrs. GUNN & SONS, Olton, who deservedly received the 1st prize. This firm staged a tall, narrow display, chiefly of the single and decorative kinds. The 1st prize in the class for 24 cut Roses was awarded to Messrs. JAS. COCKER & SONS, Aberdeen, who showed *Lyon Rose*, *Auguste Rigokard*, *Caroline Testout*, *Alfred Colomb*, Mrs. J. Laing, and *Earl of Warwick*. 2nd, Messrs. ALEX. DICKSON & SONS, Newtownards. Messrs. J. COCKER & SONS also excelled in the class for 15 cut Roses, Messrs. ALEX. DICKSON & SONS, Newtownards, being again 2nd. Dr. RAMBAUT, Bicton, showed the best 12 blooms.

CARNATIONS.

The 1st prize for a collection of cut tree Carnations was awarded to Mr. C. WATERS, Balcombe, who showed fine flowers intermingled with a judicious amount of green foliage. 2nd, Mr. W. ANGUS, Penicuik. The premier exhibit of a collection of cut Carnations and Picotees was shown by Messrs. M. CAMPBELL, in whose collection the lighter shades predominated. 2nd, Messrs. A. R. BROWN, King's Norton, who had more colour but inferior blooms. In a similar class, from which traders were excluded, Mr. W. H. BANKS was placed 1st. 2nd, Messrs. A. R. BROWN.

Messrs. M. CAMPBELL & SON, High Blantyre, N.B., showed the best 12 vases of Carnations or Picotees. 2nd, Messrs. A. R. BROWN, King's Norton. The best-displayed 12 bunches of stove or greenhouse flowers was exhibited by the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. Searle); a very meritorious collection, the chief flowers were *Hedychium coronarium*, *Cassia corymbosa*, and *Carnation Edith Waters*. 2nd, Mr. D. NUTTALL.

The 1st prize in a class for 24 bunches of cut flowers was won by Lord HARLECH. He showed large bunches of *Ixora Duffii*, *Gloriosa superba*, *Dipladenia* and *Pancratium*. 2nd, Mr. F. BIBBY, Hardwick Grange (gr. Mr. W. Taylor). Mr. A. E. H. OWEN, Berriew (gr. Mr. O. Oakley), excelled in the class for 12 bunches of cut flowers of annuals. *Lavatera trimestris*, *Cosmea* and *Salpiglossis* were shown well. 2nd, Mr. W. H. BANKS. Mr. A. MEYERS, Shrewsbury, who staged immense trusses of distinct-coloured flowers in the class for 12 trusses of single zonal *Pelargoniums*, was awarded the 1st prize. 2nd, Lord HARLECH. Mr. A. MEYERS was also 1st for 12 trusses of double and semi-double *Pelargoniums*. 2nd, Capt. H. LONSDALE, Shavington Hall.

HARDY FLOWERS.

Mr. A. BRYDON obtained the 1st prize for 12 bunches of hardy flowers with a very bright stand arranged as a steep, sloping bank. This arrangement, though of a somewhat formal character, displayed the flowers in an admirable manner.

The exhibit of 24 spikes of *Gladioli* which obtained the 1st prize for Messrs. G. MAIR & SONS, Prestwich, was very fine. The spikes were long and stout, and bore large, fresh flowers. 2nd, Mr. A. BRYDON. 3rd, Messrs. HARKNESS & SONS.

The 12 spikes of *Gladioli*, in a class for these flowers, were also of very high merit. Mr. A. BRYDON, Innerleithen, was awarded the 1st prize.

In the county class for *Gladioli*, Lord HARLECH was placed 1st.

The best collection of 12 vases of border *Phloxes* was exhibited by Mr. F. EAMES, Frome. 2nd, Mr. R. HAYES, Grasmere.

DAHLIAS.

The 1st prize for a collection of Cactus or Decorative Dahlias arranged on a table having a frontage of 8 feet 6 inches was won by Mr. JOHN WALKER, Nurseryman, Thame. The inclusion of tall bamboo epergnes filled with large blooms relieved with suitable greenery gave a note of importance to the group; vases and baskets contained choice specimen flowers. 2nd, Messrs. KEYNES, WILLIAMS & Co., Salisbury. 3rd, Mr. JOHN E. KNIGHT, Wolverhampton.

Mr. WALKER also showed the best collection of 24 blooms of Show or Fancy Dahlias, prominent varieties being Golden Fleece, Dandy, Rev. Gooday, and the Reverend. 2nd, Messrs. H. CLARK & SONS, Rodley, with but slightly inferior blooms.

Twelve blooms Show or Fancy Dahlias were best shown by Mr. J. E. WHITE, Bramley. 2nd, Mr. T. JONES, Ruabon.

Messrs. H. CLARK & SONS, Rodley, with a well-filled board of very fresh blooms, won the 1st prize in the class for 24 Cactus Dahlias. 2nd, Messrs. BOTTOMLEY & BURTON, Elland; whilst in the classes for 18 and for 12 Cactus Dahlias, Mr. H. PEERMAN, Nantwich, was awarded the 1st prize.

DECORATED TABLES.

These exhibits were arranged on the side table around one half of the tent. When viewed as a whole it was a rather disappointing class. This was due to the long stretch of white table cloth. There were 16 tables, and, as might be expected, this resulted in the selection of a variety of

flowers. Speaking generally, a somewhat similar style of arrangement permeated the whole of the exhibits and nearly all were lightly arranged. Many competitors employed only one kind of flower, some used Carnations (of pink shades). The small-flowered *Coreopsis* also found favour. Several tables were decorated with Sweet Peas and appropriate foliage: in one case trails of bronze-coloured *Selaginella*. In three instances the flowers of *Gloriosa* entered largely, or wholly, into the scheme, and these were decidedly the brightest and most attractive of the large class. The 1st prize was awarded to Mrs. W. J. GARNER, Altrincham, who had a rather better arrangement than the majority of the competitors. *Gloriosa Rothschildiana* was the flower most largely used.

VEGETABLES.

The Society's premier class was for a collection of 12 dishes, distinct. There were five exhibits, the 1st prize being awarded to the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson). He showed superb Gladstone Peas, Ailsa Craig Onions, Perfection Tomatos, Superb Pink Celery, Prizetaker Leeks, Prizewinner Runner Beans, Ideal Potatos, Intermediate Carrots, Delicacy Cucumbers, and others. A total of 67 points was awarded for the collection. The 2nd prize was won by Mr. J. HUDSON, Leicester, whose collection obtained 52 points. 3rd, H. ANDREWS, Esq., Toddington Manor (gr. Mr. J. R. Tooley), with 45 points.

In the class for nine dishes, open only to growers in the county of Shropshire, Captain HEYWOOD LONSDALE, Shavington Hall (gr. Mr. J. Mills), was placed 1st for good produce.

There was much competition in the class for six dishes of Potatos, F. BIBBY, Esq., Hardwicke (gr. Mr. W. Taylor), winning the 1st prize with the varieties Admiral, Chapman, Favourite, Britannia, Satisfaction, and Syon House. 2nd, Duke of PORTLAND, who also had clean, handsome tubers.

Robert Sydenham Limited offered prizes in a class for eight dishes. There were four entries, the 1st prize being awarded to Mr. J. H. PUGH, Newtown, who had good Ailsa Craig Onions, Gladstone Peas, Lyon Leeks, Holmes Supreme Tomatos, Clayworth Prize Celery, Scarlet Intermediate Carrot, Factor Potatos, and Cauliflowers; 2nd, Rev. J. DAVIES, Stackpole Rectory (gr. Mr. T. Phillips); 3rd, E. DEAKIN, Esq., Hay Mills.

Messrs. Sutton & Sons' class was for nine kinds and in this class there were six exhibits. The Duke of PORTLAND, Welbeck Abbey, Worksop (gr. Mr. James Gibson), won the 1st prize easily with superb examples of Ailsa Craig Onions, Prizetaker Leeks, Superb Pink Celery, Autumn Giant Cauliflower, Princess of Wales Tomatos, Best of All Runner Beans, Centenary Peas, New Intermediate Carrots, and Satisfaction Potatos; 2nd, H. T. TATHAM, Esq., Elstree (gr. Mr. Gaiger), who had excellent Onions, Celery, Leeks, Potatos, and Tomatos; 3rd, Col. CORNWALLIS WEST, Castle Ruthin (gr. Mr. H. Forder).

Messrs. Jas Carter & Co. offered prizes in a class for six dishes, and there were five entries. The 1st prize was won by Mr. G. W. ROBINSON, Burton-on-Trent, who had good Record Onions, Red Giant Runner Beans, Goldfinder Potatos, Giant Pink Celery, Autumn Giant Cauliflowers, and Model Leeks. Mr. TATHAM was placed 2nd in this class, his fine Onions being of the true Record type. Scarlet Emperor Runner Beans were also good in this collection. 3rd, Mr. A. T. RAINBOW, Northfield.

Messrs. Webb & Sons offered prizes for collections of nine dishes. The 1st prize in this class was won by an able exhibitor, Mr. J. HUDSON, Leicester, who had first-rate Ailsa Craig Onions, Emperor Tomatos, Gladstone Peas, Exhibition Runner Beans, Defiance Intermediate Carrots, and Champion Prize Leeks. The Misses HOWELL, Berriew (gr. Mr. E. Jones), were placed 2nd, and Mr. A. T. RAINBOW 3rd.

Messrs. Clibran & Sons' class was for 12 dishes, but there were only two entries forthcoming. The best from J. R. DIXON NUTTALL, Esq., Prescott (gr. Mr. J. W. Barker), who had the Bell Peas, Ailsa Craig Onions, Clibran's Pink Celery, and King Edward Potatos. 2nd, Mr. G. EDWARDS, Wynnstay.

Mr. E. Murrell offered prizes in two classes, one for nine dishes, open, and one for six dishes, open, to growers in the county of Salop only. In the large class Mr. T. SANDERSON, Junr., Whittington, was placed 1st, having fine Pink Celery, good Onions, Leeks, Peas, Runner Beans, and

Potatos. 2nd, Mr. J. H. PUGH, who had capital Peas, Turnips, Celery, and Carrots. 3rd, CRAWFORD LOGAN, Esq., Overley Hall (gr. Mr. H. Turner). In the smaller class Mr. SANDERSON was again placed 1st, G. MITCHELL, Esq., Shrewsbury (gr. Mr. J. Howells), being 2nd.

Messrs. Dickson and Robinson had a class for nine dishes, which brought five entries. The 1st prize was won by Mrs. ARBUTHNOT, Newtown Hall (gr. Mr. R. H. Smith), who exhibited good Premier Onions, Snowdon Cauliflowers, Giant Exhibition Runner Beans, Gladstone Peas, Eclipse Potatos, and white Celery. 2nd, Lord TREVOR, Brynkinalt (gr. Mr. W. Daniel), who showed fine Onions, Leeks, Celery, and Tomatos. 3rd, the Misses HOWELL.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), set up a large collection of about 100 dishes of vegetables, the exhibit occupying some 40 feet length of tabling. He had Champion Prize Leeks, white and pink Celeries, Ailsa Craig and Masterpiece Onions, numerous white and coloured Potatos, red and yellow Tomatos, Royal Favourite and New Freedom Cucumbers, Prizewinner Carrots, Stourbridge Marrow Peas, Runner and Dwarf French Beans, Beets, Cabbages, Cauliflowers, Lettuces, Marrows, Aubergines, Radishes and many other kinds.

Messrs. CLIBRANS, Altrincham, had, with other products, many good dishes of vegetables, including in great variety Potatos, Tomatos, Cucumbers, Carrots, Marrows, numerous Gourds, Beets and other things.

Numerous vegetables were shown by Messrs. SUTTON & SONS, Reading, in their fine group in the fruit tent, including Potatos, Tomatos, Beets, Carrots, climbing Beans, Onions, Leeks, Mushrooms and others, all excellent in quality.

Messrs. WEBB & SONS, Wordsley, arranged in front of their flower group a fine selection of vegetables similar to those just named, the samples being of very high excellence. In these cases the products seen were representative of the respective firms' stocks.

NON-COMPETITIVE EXHIBITS.

Messrs. J. VEITCH & SONS, Chelsea, filled one of the recesses in the large plant tent with a collection of choice stove and greenhouse plants, relieved with Orchids in flower. The group, which was arranged on the ground in an arc formation, was much admired. *Nepenthes*, carrying numbers of pitchers, were raised high on slender stands draped with *Asparagus Sprengeri*. Such fine Orchids as *Miltonia vexillaria*, *Lælio-Cattleya luminosa rosita*, *callistoglossa*, and *Dominiana*, *Oncidium lanceanum*, the dainty brick-red-flowered *Epidendrum vitellinum* and *Dendrobium* regium occupied the middle part of the group. Tall, well-coloured *Codiaeums*, large-leaved *Anthuriums*, and other fine-foliaged tropical plants, such as *Marantas*, *Heliconias*, *Alocasias*, with the huge *Coccoloba pubescens*, were tastefully displayed. At the front a pan of *Bertolonias* in several varieties furnished richly-coloured foliage with delicate veins.

Messrs. ED. WEBB & SONS, Wordsley, made a very imposing display with flowers, fruits, and vegetables. Sweet Peas and Lilies were employed largely for decorative effect, the culinary produce being arranged in the foreground. Melons, Tomatos, Cucumbers, Carrots, Beets, Onions, and other kinds of vegetables were represented by magnificent samples.

KING'S ACRE NURSERIES, LTD., Hereford, showed a large number of pot fruit trees and dishes of hardy fruits. The trees of Apples, Pears, and Plums were very heavily fruited, notable varieties being (Apples) Gascoyne's Scarlet Seedling, Emperor Alexander, The Queen, and Cox's Orange Pippin, (Pears) Beurré Diel, Nouveau Poiteau, Marie Benoist, and Beurré Fouqueray, and (Plums) Grand Duke, Mallard, and White Magnum Bonum. There were also Figs, Grapes, and Peaches. This firm also showed floral devices.

Messrs. SUTTON & SONS, Reading, put up a magnificent exhibit of flowers, fruits, and vegetables, the general effect being excellent. At either end were large half-circular groups of *Gloxinias*, and in the centre a batch of *Begonias* of the tuberous-rooted section. Separating these were choice Beets, Onions, Potatos, Beans, Carrots, Tomatos, Marrows, Peas, &c., also large well-flowered Melons.

Messrs. HOBBIES, LTD., Dereham, Norfolk, made a pretty exhibit with Roses, having a miniature Rose garden, the groundwork being of H.P. and other large blooms, with standard *Wichuraiana* sorts rising at intervals. Messrs. HOBBIES also exhibited a group of Dahlias, that provided one of the finest colour effects in the largest tent. These were mainly of the broad floreted type, but a few Cactus flowered varieties were included along the front of the group.

Messrs. BAKERS, Wolverhampton, set up a large collection of *Antirrhinums* in batches of different coloured varieties. The plants were remarkably dwarf, and very freely flowered; the variety Dazzler, of orange-red shade, was remarkably effective. There were 29 distinct sorts. This firm also showed Chinese Asters, but they were arranged against a heavy background, and appeared to disadvantage in the dull light.

Ferns in great variety were arranged by Messrs. H. B. MAY & SONS, Upper Edmonton, with their customary skill. Small *Platyceriums*, such as *P. grande*, the tropical *P. angolense*, *P. aethiopicum*, and *Drynaria quercifolia* were the more prominent plants. *Polypodium phymatodes*, *Adiantum Veitchii*, with bright red young fronds; a mass of *Nephrolepis Marshalli* compacta, the filmy *Nephrolepis Neubertii*, *Davallia tenuifolia Veitchii*, and *Pteris Summersii* are only a few of the many choice kinds shown.

Mr. EDWARD V. LOW, Vale Bridge, Haywards Heath, showed a small exhibit of Orchids, principally of choice Cattleyas and *Lælio-Cattleyas*, including the beautiful Cattleya Iris, *C. Adula*, and *Lælio-Cattleya callistoglossa*.

Messrs. AMOS PERRY, Enfield, Middlesex, set up a quantity of cut flowers of Delphiniums. Besides their well known standard kinds, *La France*, a baffling but attractive mixture of colour tints, *Perfection* and *Pygmalion* were much admired. Between their two collections of Delphiniums Messrs. PERRY had a selection of hardy *Nymphæas*.

Messrs. ISAAC HOUSE & SONS, Bristol, occupied one of the recesses of the large plant tent with a fine collection of hardy flowers, *Phloxes*, *Helianthemums*, *Delphiniums*, with *Nymphæas*, *Typhas*, *Carex*, *Pampas Grass*, &c.

Miss S. S. THOMPSON, Alfred Road, Handsworth, exhibited a group of succulent plants, all in remarkably good health.

Mr. JOHN WALKER, Thame, showed a very large exhibit of Dahlias, in which all types of the flower were represented by good blooms.

Mr. EDWIN MURRELL, Shrewsbury, showed small but very bright and fresh Roses, also a number of choice Gladioli.

Messrs. DICKSONS, Chester, exhibited a mixed group of flowers of remarkably choice quality. A large *epergne* filled with *Lilium auratum rubro-vittatum* was conspicuous in the centre, and there were other good vases of Lilies, also Roses, *Gaillardias*, *Lupins*, *Erigerons*, and *Delphiniums*.

Mr. H. N. ELLISON, West Bromwich, had excellent Ferns in the fruit tent, providing a pleasing change of greenery.

Mr. ALBERT MYERS, Shrewsbury, showed Zonal-leaved *Pelargoniums* and *Coleuses*, the former being especially good.

Messrs. JONES & SONS, LTD., Croton Hill Nurseries, Shrewsbury, staged a number of Ferns of *Nephrolepis exaltata* and its varieties, a collection of Sweet Peas, varieties of perpetual-flowering Carnations, and a few hardy fruits. (Silver Medal.)

Messrs. JONES & SONS, LTD., Shrewsbury, staged vases of Sweet Peas and Carnations; the Sweet Peas represented most of the varieties in commerce, and the quality, considering the unfavourable season, was remarkably good.

Messrs. DOBBIE & Co., Edinburgh and Mark's Tey, Essex, had a large exhibit of Dahlias and Sweet Peas, the latter being some of the finest in the show: Earl Spencer, orange; Princess Victoria, pink; Syeira Lee, rosy-carmine; Melba, bright orange; Etta Dyke, white; Mrs. C. W. Breadmore, creamy; yellow with blush edges; and Florence Nightingale, lavender, are a selection of the choicer varieties.

Many greenhouse Ferns, bordered with Saxifrages and other Rock plants, from Messrs. PRITCHARD, Shrewsbury, filled a length of side staging. At the back, tall plants of purple-leaved *Cannas* relieved the green of the Ferns.

Messrs. W. & J. BROWN, Stamford, brought a quantity of fresh Roses, which were tastefully arranged with a few well-coloured *Codiaeums*, *Kochia trichophila*, &c., in small pots. At the back long sprays of *Humea elegans*, rising from *Gaillardias* and *Liliums*, arched gracefully over this fine exhibit.

Messrs. YOUNG & Co., Cheltenham, staged exceedingly fine Carnations in bold masses, chiefly of one variety.

Messrs. DICKSON & ROBINSON, Manchester, arranged an attractive table of fine *Liliums* (*L. longiflorum giganteum*, *L. speciosum rubrum*), many varieties of Carnations, border flowers, and fruits of "Manchester" Melon.

ROBERT SYDENHAM LIMITED, exhibited a very dainty arrangement of Carnations in a number of gilt stands. The colours of the flowers were harmoniously blended with delicate fronds of *Adiantum cuneatum*, *Smilax*, and *Asparagus plumosus nanus*.

On a side table in one of the large tents Messrs. GUNN & SONS, Olton, Manchester, arranged a large selection of cut blooms of herbaceous *Phloxes*, Roses, and various hardy flowers.

A long stretch of staging was filled by Messrs. JARMAN & Co., Chard, with splendid cut flowers and Apples. Their new *Centaureas* of the Sweet Sultan type admirably illustrated the decorative value of these sweetly-scented flowers.

Sweet Peas in great numbers were staged by Messrs. W. H. SIMPSON & SONS, Birmingham.

Mr. BOWDLER, Shrewsbury, showed ripe fruits of the "Strawberry Raspberry."

A collection of Gladioli with large spikes was exhibited by Messrs. G. MAIR, Prestwich.

Phloxes and other hardy flowers were shown by Messrs. EAMES, Frome.

Messrs. KELWAY & SON, Langport, exhibited a large collection of Gladioli.

Roses were shown by Messrs. ALEX. DICKSON, Newtownards.

Mr. W. L. PATTISON, Shrewsbury, arranged in small stands, in the form of sprays on a sloping black-clothed board, a surprising variety of Pansy and Viola flowers.

Messrs. HARKNESS & SONS, Bedale, staged Gladioli and various *Gaillardias*.

Messrs. JOHN FORBES, LTD., Hawick, showed *Phloxes*, *Pentstemons*, Carnations, and Dahlias.

Messrs. BLACKMORE & LANGDON, Bath, staged a magnificent collection of double-flowered tuberous-rooted *Begonias* growing in pots.

Stout stems of Tomatos (Fonthill and Devonia), bearing long clusters of ripe fruits, were set up by Messrs. ISAAC HOUSE & SONS, Bristol.

Messrs. CALDWELL & SONS, Knutsford, arranged a collection of hardy herbaceous flowers.

Messrs. ALDERSEY & MARSDEN JONES, Malpas, had a lightly-arranged collection of cut flowers, including Sweet Peas.

A small but highly meritorious collection of Roses was staged by Messrs. JAS. COCKER & SONS, Aberdeen.

Messrs. HERD, of Penrith, arranged a representative collection of Sweet Peas with some *Pentstemons*, &c.

Messrs. R. HAYES, Grasmere, showed perennial *Phlox* in variety.

Mr. T. HAYES, Keswick, staged an interesting collection of Heathers, fresh from the Highlands, mostly massed in large, flat hampers.

Mr. GIBSON, Bedale, Yorkshire, showed a collection of hardy flowers.

Mr. F. W. JOHNSTON, Manchester, showed floral devices in variety.

AWARDS.

LARGE GOLD MEDALS.

Messrs. Clibrans, Altrincham, for flowers and vegetables; Messrs. Sutton & Sons, Reading, for vegetables, Melons, and flowers; King's Acre Nurseries, Ltd., Hereford, for fruit trees in pots; Hon. Vicary Gibbs (gr. Mr. E. Beckett) for vegetables; Messrs. Jas. Veitch & Sons, Ltd., Chelsea, for Orchids, stove and greenhouse plants; Messrs. Webb & Sons, Stourbridge, for flowers and vegetables.

SMALL GOLD MEDALS.

Messrs. H. B. May & Sons, Edmonton, for Ferns; Messrs. Dickson & Robinson, Manchester, for cut flowers; Messrs. DICKSONS, LTD., Chester for border flowers and floral devices.

SILVER-GILT MEDALS.

Messrs. I. House & Son, Westbury-on-Trym, for plants and flowers; Messrs. Herd Bros., Penrith, for Sweet Peas; Messrs. Bakers, Wolverhampton, for *Antirrhinums* and Asters; Messrs. Caldwell & Sons, Knutsford, for cut flowers; "Hobbies," Ltd., Dereham, Norfolk, for Roses and Dahlias; Messrs. Gunn & Sons, Olton, for *Phloxes*, &c.; Mr. Amos Perry, Enfield, for Delphiniums and water plants; Messrs. Alex. Dickson & Sons, Newtownards, for Roses; Mr. John Forbes, Ltd., Hawick, for hardy flowers; Messrs. Dobbie & Co., Edinburgh and Marks Tey, for Sweet Peas; Mr. H. N. Ellison, West Bromwich, for Ferns; Messrs. Pritchard & Sons, Christchurch, for Ferns and Alpine plants; Messrs. H. Jones & Sons, Shrewsbury, for Sweet Peas and cut flowers; Messrs. W. & J. Brown, Stamford and Peterborough, for Roses; Messrs. Young & Co., Cheltenham, for Carnations; Messrs. Kelway & Son, Langport, for Gladioli.

SILVER MEDALS.

Messrs. Simpson & Sons, for Sweet Peas; Mr. E. Murrell, for Roses; Mr. A. Myers, for *Pelargoniums*; Messrs. Jarman & Co., Chard, for Dahlias, Sweet Sultans, &c.

BRONZE MEDALS.

Mr. W. L. Pattison, Shrewsbury, for Violas; Mr. T. R. Hayes, Keswick, for hardy Heaths; Robert Sydenham Limited, Birmingham, for Carnations; Mr. J. W. Johnson, Manchester, for floral designs, &c.; Messrs. J. Gibson & Co., Bedale, for herbaceous flowers; Mr. F. Eames, Frome, for cut flowers; Mr. Edward Low, Haywards Heath, for Orchids; and Messrs. G. Mair & Son, Prestwich.

ENGLISH ARBORICULTURAL.

AUGUST 14-18.—The 30th annual summer meeting of this society was attended by about 80 members, including Dr. Somerville, Dr. Henry, Sir Hugh Beevor, Sir John Keane, Col. Petre, Capt. Saunderson, Mr. H. J. Elwes, Mr. E. Davidson, secretary, Mr. M. C. Duchesne, local secretary, and many landed proprietors, land agents and leading foresters. Mr. E. R. Pratt of Downham, unfortunately absent through illness, has been re-elected president. The Great Central Hotel, London, was made headquarters, and the itinerary included visits to the following estates:—Tuesday: Cliveden, Dropmore, and Langley Park. Wednesday: The Chiltern Hills, Wyfold Park, and High Wycombe. Thursday: Ashridge Park, Berkhamsted. Friday: Strathfieldsaye.

At Cliveden the magnificent views through the wood, the lovely terraces, the marble fountain, and the finely-figured sarcophagi which adorn the lawn, brought with other valuables from Pompei, were of great interest, as also were the cross-sections of trees, one the Giant Sequoia of California—the annual rings of which numbered 867—its diameter being 16 feet; the other a fossilised tree mounted as a table and polished.

Dropmore, with its famous Pinetum and woods, afforded ample opportunities for measuring instruments and notebooks; timber trees of the best, as well as ornamental trees, abound. The finest Cedar avenue in the country is at Dropmore, whilst Larch towering to the height of 130 feet were planted, we were told, less than 100 years ago. Some of the principal trees are *Pinus Pallasiana*, 98 feet; *P. Laricio*, 97 feet; *P.*

ponderosa, 99 feet; *P. rigida*, 84 feet; *P. Lambertiana* 85 feet; *P. insignis*, 77 feet, and *P. monticola*, 70 feet. An interesting but rarely seen tree was *Larix microcarpa*, a tree esteemed in America for its hard timber and resinous quality. One of the rarest trees in this country, too, is *Tsuga Brunoniana*, planted in 1847, and called the Hemlock of the Himalayas. It may be of interest to gardeners to know that *Gaultheria Shallon* here grows luxuriantly under a fairly dense canopy of Beech.

At East Burnham Park the society was entertained by Mr. Harry J. Veitch at lunch. Here the gardens, though suffering much from the prolonged drought, afforded the company great pleasure, particularly the very pretty water garden.

Langley Park was next visited, and the available time was fully occupied viewing some very fine old Scotch Firs in the Black Park. The Pinetum, planted in 1887, contains some very vigorous and shapely specimens of *Abies nobilis*, *A. grandis*, *Picea orientalis*, *Pinus Strobus*, *P. excelsa*, &c., and a host of good trees throughout the woods. In the gardens specimen Bamboos are particularly good—especially *Arundinaria nitida*, with a spread of 21 feet, and a good collection of Himalayan *Rhododendrons* is being formed. Several fine plants of *Chamærops*, planted out permanently, are in capital condition, also well-grown and coloured specimens of *Cupressus Lawsoniana lutea*. On a wall is a *Wistaria sinensis* laden with fruit—a tribute to the sunny season. A Cedar of Lebanon is reputed to cover the largest area of any known tree in this county, it is 150 yards in circumference, and near it is a very marked instance of successful layering in a common Spruce; several branches of about 1 inch thickness having produced fine trees, which partly surround the parent tree.

High Wycombe, the home of the chair-making industry, claims to have no fewer than 70 factories. Some of these were visited to see the various timber converted, and it was interesting to learn of the extensive foreign demand for the better productions.

The Beech woods on the Chilterns, managed on the selection principle, proved instructive, and on the Wyfold Estate was witnessed the conversion of Beech for chair-making, and the turning of chair legs and the manufacture of tent pegs for Woolwich.

At Ashridge Park a full day's work was thoroughly enjoyed, for, without doubt, the estate holds some of the finest timber in Great Britain. In Messrs. Elwes and Henry's new work, *The Trees of Great Britain and Ireland*, we read: "At Ashridge Park, Bucks., the property of Earl Brownlow, are perhaps the most beautiful and best-grown Beeches in all England, not in small numbers, but in thousands."

"... The celebrated Queen Beech remains, and though in one or two places it shows slight signs of decay, it may, I hope, live for a century or more, as it is in a fairly sheltered place, and has no large spreading limbs to be torn off by the wind. This extremely perfect and beautiful tree was measured in 1903. We made it as nearly as possible to be 135 feet high, and this is the greatest height I know any deciduous tree, except the Elm, to have attained in Great Britain. Its girth was 12 feet 3 inches, and its bole straight and branchless for about 80 feet."

"... But though it is doubtful whether any place in England can boast so many perfect Beech trees as Ashridge, this park contains some of the finest Limes, the largest Horse Chestnuts, and the most thriving and bulky Chestnuts, and in a wood not far off is an Ash which is much the best-grown tree of its species, if not the largest I have seen in England."

The many subjects in the gardens of more than ordinary interest must, for consideration of space, be passed over for the present; a fairly good specimen of the Evergreen Beech, *Fagus betuloides*, may, however, be named, and an Oak planted in her early childhood by Queen Victoria, 1823, which has made rapid growth, measures 13 feet in girth at 4 feet from the ground. One of the park Chestnut trees referred to already has a spread of 108 feet.

At Strathfieldsaye the party was met by the Duke of Wellington, who is keenly interested in the subject of forestry, and who conducted and invited criticism on the young woods, &c. Work is here being carried out on approved lines with due regard to soil, position and market.

The mature trees on the estate are very fine. Among the best examples are *Abies grandis*, Cedars—the best is said to be 110 feet in height and 11 feet 9 inches girth, with a clean bole of about 40 feet—and *Sequoia gigantea*, planted in 1857, 90 feet high.

The Sequoia avenue, nearly 400 yards, is very evenly good—height about 50 feet. Then an Elm avenue, about a mile long, is exceedingly fine—the trees probably over 200 years old.

One of the most interesting and rare trees in the grounds is the "Tupelo Tree," *Nyssa bicolor*, a fine piece, desirable for its exquisite autumn colour, and near it a specimen *Liquidambar*, about 45 feet high. *Cupressus thuoides* 35-40 feet high, and with a circumference of about 50 feet, and small plants, which have been out several seasons unprotected, of *Cupressus lusitanica*. An exceedingly fine specimen of *Taxodium distichum*, has a girth of 13 feet about a foot from the ground and about 55 feet in height. *Arborist*.

SWANAGE HORTICULTURAL.

AUGUST 7.—The annual exhibition of this society took place on the above date in fine weather, the opening ceremony being performed by Sir Daniel Morris, K.C.M.G. The principal prize was the Swanage Coronation Challenge Cup, offered for a collection of nine varieties of vegetables and six varieties of fruit in a class open to growers in the county of Dorset. This prize was won by Mrs. BANKS, Kingston Lacy (gr. Mr. James Hill), who showed fruits of exceptionally fine quality. The 2nd prize in this class was won by Sir RANDOLPH BAKER, Bart., Ranston, Blandford (gr. Mr. A. E. Usher), and the 3rd prize by Mr. W. J. SQUIRE, Longham. The fruit classes contained some excellent exhibits, particularly of Grapes. Sweet Peas and Roses were also shown well. The best group of plants and flowers were exhibited by Mr. W. J. SQUIRE, Longham, who also won the 1st prizes in the classes for (1) Roses, (2) a basket of cut flowers, and (3) Tomatos. In the open classes Mr. GEORGE MASTERS, Swanage; Mrs. RANDALL, Swanage; Mr. E. MAHAGAN; Mr. KENNETH ANDERSON (gr. Mr. H. W. Holland), and Mr. A. YOUNG were the winners of 1st prizes. The finest collection of vegetables shown by an amateur, for which a Silver Challenge Cup was offered by Messrs. James & Co., High Street, Swanage, was staged by Mr. JAMES STOCKLEY, Herston. Messrs. Sutton & Sons offered prizes in a class for nine bunches of Sweet Peas, the 1st prize being won by Mrs. EARDLEY. In Mr. Henry Eckford's class for Sweet Peas, Mr. A. H. HOLLAND staged a premier collection, and he also excelled in Messrs. Carter & Co.'s class, for six distinct varieties of Sweet Peas. In Robert Sydenham Limited's class for Sweet Peas, Mr. A. G. WILLCOX excelled, and this exhibitor also won the 1st prize in Messrs Ed. Webb and Sons' class, whilst Mr. R. E. WIRT showed the premier collection in Mr. J. Stevenson's class.

NATIONAL VEGETABLE TRIAL OF GLOBE BEETROOTS.

A TRIAL of seventeen stocks of Globe or round-rooted varieties of Beet, in conjunction with a much larger one of long-rooted Beets, has been conducted under the auspices of the National Vegetable Society simultaneously on sand at *The Times* Experimental Station, Sutton Green, Surrey, under the control of Mr. Harry Foster, and on loam at Marsh Farm, Twickenham, under the control of Mr. William Poupart. At Sutton Green the rows were 22 feet long and the varieties were sown in duplicate. At Marsh Farm the rows were single and rather shorter. The sowing was made in both cases early in the month of May, and the seeds germinated well; the seedlings were thinned only moderately. The primary tests were of the roots in form, and of the flesh in colour and fineness of grain. Several roots of each stock were pulled and cut to make the tests complete. After the most careful scrutiny of the roots of both trials, three marks or "Very Highly Commended" were given to the Sutton Globe, from Messrs. Sutton & Sons, Reading; Crimson Globe, from Messrs. Dickson & Robinson, Manchester; Early Globe, from Messrs. Yates, of Evesham; Early Red Globe, from Messrs. Barr & Sons,

Covent Garden; and Blood Red, from Messrs. Hurst & Son, Houndsditch. Two marks or "Highly Commended" were given to Globe Witham Fireball, from Messrs. R. Veitch & Sons, Exeter; Selected Globe, from Messrs. Dobbie & Co., Edinburgh; Deep Blood Red, from Messrs. Alex. Dickson & Sons, Newtownards, County Down; and Crimson Globe, from Messrs. Toogood & Sons, Southampton. With respect to these last four varieties, it is but fair to say that on other soils their flesh may equal in colour those of the first group.

SCOTTISH HORTICULTURAL.

AUGUST 19.—About 70 members of this association, including the president, Mr. Massie, paid a visit to Manderston, the Berwickshire seat of the Honourable Lady Miller, on the above date. On the way from Duns station, where the party arrived at midday, a visit was made to Mr. Malcolm's garden in order to inspect his collections of Sweet Peas. Passing through Duns public park, the members made their way to Manderston, where they were entertained at lunch by Lady Miller, and thereafter under the guidance of Mr. Marshall, the gardener, and Mr. Moir, they made an inspection of the gardens. Lady Miller accompanied the visitors through the flower garden, and pointed out its leading features.

NORTH OF ENGLAND HORTICULTURAL.

In addition to the awards mentioned on p. 140 as having been made at this society's recent exhibition at Harrogate, Silver Cups were awarded by the Royal Horticultural Society to Messrs. Harkness & Sons, Bedale, for Gladioli and herbaceous flowers; Messrs. Artindale & Son, Sheffield, for herbaceous and rock-garden plants, also Carnations, and Messrs. Batchelor & Son, Harrogate, for border plants. R.H.S. Silver-gilt Medals were awarded to Messrs. Charlesworth & Co., for Orchids, and to Messrs. H. B. May & Sons, Edmonton, for Ferns.

DEBATING SOCIETY.

STIRLING & DISTRICT HORTICULTURAL.

The members held their last excursion for the season on August 12, when a visit was made to Hopetoun, the seat of the Marquis of Linlithgow. The journey, a distance of 30 miles, was made by motor. The gardens and pleasure grounds of this historic place were at their best condition, the most conspicuous feature being the flowering plants massed together in separate colours and kinds in beds and borders.

GARDENING APPOINTMENTS.

Mr. THOMAS SMITH, for 6 years Gardener to Mrs. DALLAS YORKE, Walmsgate Hall, Louth, Lincolnshire, as Gardener to the Right Hon. The Marquis of Ripon, Coombe Court, Kingston Hill, Surrey. (Thanks for donation of 2s. for the R.G.O.F. box.—Eds.)

Mr. FRED W. SCHOFIELD, until recently Foreman in the Landscape Department of Messrs. J. BACKHOUSE & SONS, LTD., York, as Gardener to The Hon. Mrs. PLEYDELL BOUVIERIE, Coleshill House, Highworth, Wiltshire.

ASPIDISTRA AND MARROW: K. C. D., *Peterboro'*. No disease is present in the Aspidistra leaves. The trouble is due to improper watering; either too little or too much moisture has caused them to turn yellow. It is probable that your Marrow fruits drop when they are about 1½ inch long because they have not been fertilised. Dust the stigmatic surface of each female blossom with the central part of the male flower, holding the latter by the stalk.

CARNATIONS ATTACKED BY MEALY BUG: J. J. T. The insect attacking the roots of your Carnations is the ground mealy bug (*Ripersia terrestris*). Inject bisulphide of carbon in the soil, 4 ounces to the square yard, or, if they are pot plants, take them out, spray the roots lightly, and replace them in the pots, keeping the plants for some days in the dark.

FUNGI: F. E. S. The fungus is not a *Boletus*, but a species of *Agaric*. The specimen sent is too imperfect for us to identify, and we cannot say if it is edible or not. Great caution should be exercised with regard to eating unfamiliar "Mushrooms." You would find Swanton's *Fungi and How to Know Them* of great assistance. A preliminary visit to the Natural History Museum, South Kensington, where there are excellent models and paintings of all the edible species would prove invaluable.

GRAPES: A. M. S. There is no trace of any fungus on the examples of Grapes sent. The injury must be attributed to "scorch" or "scald."

INSECT IN MELON HOUSE: Glen. The hornet-like insect is the giant wood-wasp (*Sirex gigas*), which breeds in old, rotten wood.

INSECTS: J. McC. The insects found on the Water Lilies are the caddis worm larvæ in the "cases" they form round them. The only remedy is to shake the plants well, when the "cases" will float to the top of the water. Afterwards, either run off the surface water or collect the larvæ mechanically.

MUSHROOMS: H. B. Mushrooms frequently fail to develop because of (1) the beds being insufficiently firm, or (2) the atmospheric conditions being improper. It is essential, and especially during the summer months, that the house or shed in which Mushrooms are grown be kept cool, and damped frequently during the daytime and evening. The roof and walls should be syringed and the paths kept in a moist condition. Light should be excluded, no ventilation permitted, and no fire-heat should, in any case, be employed. It is not necessary to place a covering of any kind over the beds when Mushrooms are grown under these conditions. See that the soil and the other materials of the bed are sufficiently moist when the Mushrooms are developing, and always apply water in a tepid condition.

NAMES OF FRUITS: Mrs. Wheldon. Plum Deniston's Superb.—F. Thompson. The Grape is probably Buckland Sweetwater, although the bunch much resembles Dutch Sweet Water.

NAME OF PLANTS: T. H. C. Probably *Lathyrus montanus*. Send when in flower.—W. B. The varieties of *Codiaeum* (Croton) are as follow:—1, B. S. Williams; 2, Rodeckii; 3, Mme. Alfred Bleu Major; 4, Mme. Groult; 5, Mme. Imbert Koechlin; 6, Undulatum.—F. F. T. 1, *Bifrenaria Harrisoniae*; 2, *Maxillaria tenuifolia*; 3, *Oncidium pulchellum*; 4, *Odontoglossum Lindleyanum*; 5, *Brassia verrucosa*; 6, *Lycaste cruenta*.—St. Peter's. Flower quite decayed. Send fresh specimen or description of the colour of the flower and habit of the plant. We will retain the specimen sent.—A. M., Reading. 1, *Hibiscus syriacus flore pleno*; 2, *Bignonia radicans*.

RAMBLER ROSES: E. S. The season has been very unfavourable for strong-growing Roses, and your plants are probably affected by the drought. You might cut out some of the weaker wood. See that the roots are moist, and feed the plants with liquid manures. You will find directions for pruning Roses of this type in an article by *White Rose* printed on p. 141.

ROSE SHOOT SAWFLY: J. C. & S. The insect found in the Rose shoots is the Rose-shoot sawfly (*Poecilosoma candidatum*). Nothing can be done but to hand-pick the dying shoots before the grubs escape. They winter in the soil beneath the bushes.

RUNNER BEANS ATTACKED BY FUNGUS: T. V. The Runner Beans sent are just beginning to be attacked by some fungus, which is too immature for identification. Spray the young Beans with liver of sulphur solution (1 ounce dissolved in three gallons of water). If older Beans are sprayed, it is advisable to wash them well with water after cutting.

VINES: Miss E. (Ryde). The cause of the injury to the vines is not apparent on the shoot you send. There is no insect or fungus present. We can only suggest that there has been some error of culture.

GRAFT HYBRIDS.

THE production of intermediate or hybrid-like forms, as a result of grafting two species together, is a phenomenon which has long excited interest, and the classical examples* of plants to which such an origin has been attributed are familiar, by name at least, to everyone.

In habit, and in shape and size of the leaves and flowers, graft hybrids are generally more or less intermediate between their parent species; in those cases, however, where the two pure species present distinctive features of the epidermis (e.g., hairiness), it is found that the graft hybrid is not intermediate in respect of these characters, but very closely resembles one parent or the other. One striking feature of the graft hybrids demands mention, namely, the fact that they exhibit a more or less constant tendency to produce occasionally organs which show a reversion in every particular to the characters of one or other parent. Such reversions may affect entire shoots or may be confined to single leaves or flowers or even to parts of these organs. The production of reverted organs not uncommonly occurs spontaneously, that is to say, in the absence of any known external stimulus; it may be looked for

with some confidence if the hybrid shoot be wounded or mutilated.

Of the classical cases, the graft hybrids of Bronvaux, between the White Thorn (*Cratægus monogyna*) and the Medlar (*Mespilus germanica*), have a special interest in that two distinct hybrid or intermediate types exist. These two types are represented in two branches which were borne side by side, at the junction between scion and stock, on an old stem of the White Thorn upon which the Medlar had been grafted. One of the types, known as

made, until quite recently, in extending our knowledge of the processes underlying them. Only a very limited number of cases had been recorded which had any substantial claim to be regarded as graft hybrids, and nothing but failure had attended the persistent attempts which had been made to secure a repetition of the distinctive phenomena manifested in these isolated cases. As a consequence, doubts arose as to the accuracy of the accounts in which the origin of the various supposed graft hybrids was described, and

FIG. 76.—*SOLANUM TUBINGENSE*, A PERICLINAL CHIMERA OF *S. LYCOPERSICUM* AND *S. NIGRUM*.

The upper part of the shoot figured shows a reversion to *S. nigrum*, and the middle internode is a chimæra with *S. nigrum* to the left and *S. tubingenae* to the right. (After Winkler.)

Cratægo-mespilus Dardari, approaches the Medlar more closely, the other (*C. m. J. d'Asnières*) is more like the White Thorn. The same tree subsequently produced a third branch, again from the junction of stock and scion, but on the opposite side to that occupied by the first two branches; this third branch proved to be very like the form *J. d'Asnières*.

In spite of the attention devoted to the phenomena associated with the formation of graft hybrids, little progress had been

the possibility of procuring intermediate or hybrid types through the vegetative process of grafting became a much debated question.

Such was the position when, in 1909, the controversy was at length set at rest by the work of Prof. Winkler of Tübingen, who definitely established the fact that intermediate forms may be produced by a vegetative process.†

* For descriptions of these plants the reader may refer to Darwin, *Animals and Plants under Domestication*, vol. i., p. 413. Apart from Winkler's *Solanum* hybrids, the most important cases since Darwin's time are the *Cratægo-mespilus* hybrids of Bronvaux (described by Noll: *Sitzungsber., Niederrhein., Gesells., Bonn., 1905*, p. A20), and Daniel's Pear-Quince hybrid (*Revue gén. de Botanique*, xvi., p. 5, 1904). Darwin includes in his account some cases of "infectious chlorosis," which, as Batür has recently shown, appears to be due to the transference of a "virus" from the chlorotic to the normal member of the graft,

† See Winkler, *Ber. d. Deutschen Bot. Ges.*, xxv., 568, and xxviA., p. 595; *Zeitschrift f. Botanik*, I., p. 315, and II., p. 1, 1907-1910.

Winkler found that many of the members of the Solanaceæ and Cappari-daceæ possess in a notable degree the power to form adventitious shoots. Not only are such shoots formed very readily, but their development can be localized at a desired point. If, for instance, a seedling plant of the Tomato be decapitated, and care be taken to remove all the axillary buds, as well as any adventitious buds which may develop in the axils of the leaves, a number of adventitious buds will be produced from the callus which is formed over the cut surface of the stem.

This power to form adventitious buds from the callus of a wound was turned to account by Winkler when he made the experiments which finally led to the production of graft hybrids. The plants selected for experiment were the Tomato (*Solanum Lycopersicum*) and the Black Nightshade (*S. nigrum*). A number of splice, wedge, and saddle grafts was made reciprocally between young plants of these two species. After some weeks, when the union between scion and stock was established, the grafts were cut through transversely so as to expose the newly-joined tissues of the stock and scion. From the callus at the cut surface adventitious shoots were developed, as in the decapitated Tomato seedling.

The majority of these shoots had their origin in tissue appertaining either solely to the scion or solely to the stock, and were, therefore, either pure Nightshade or pure Tomato. But beside shoots which merely reproduce the pure species, Winkler obtained others, which developed upon the line of junction between the tissues of stock and scion, and in which the characters of the two pure species were combined in various ways.

In the simplest cases of this kind, which were also the first to be discovered, the tissues of the two parent species were united side by side, so as to build up a single shoot, of which the one side was Tomato and the other side Nightshade. The double nature of these shoots is made strikingly evident through the contrast between the stiff hairs and the divided leaves of the Tomato and the absence of hairs and the simple leaves of the Nightshade.

It is evident that the growing point of these plants is built up of cells of two kinds; on the one side are cells derived from the Tomato, on the other cells derived from the Nightshade. The leaves and axillary branches, which are developed from tissue derived solely from one of the components, have the characters proper to that component. But other leaves, which are inserted on the line of junction between the two components and are therefore the product of a mixed meristem, show again the two components united side by side, so that one part of the leaf is Tomato and the other Nightshade. Evidently, there is every likelihood that the buds formed in the axils of such "mixed" leaves will themselves be derived from a mixed meristem, and will, therefore, give rise anew to shoots of a mixed character.

To structures of this kind, wherein two kinds of tissue, each pure to its own

FIG. 77.—FLOWERING SPRAY OF CYTISUS ADAMI.
(A graft hybrid produced by budding *Cytisus purpureus* on *Laburnum vulgare*.)

species, are united side by side to form a single shoot, Winkler gave the name of "Chimæra."

Continuing his experiments, Winkler subsequently obtained other kinds of adventitious shoots, which were intermediate in form between the Tomato and Nightshade. In all, five distinct types, representing different combinations of the parental characters have now been ob-

parental type, changes from one intermediate type to others may take place; a parallel case to the change which occurred when on one occasion *Cratægo-mespilus* Dardari produced a shoot of *C.-m.* J. d'Asnières. The reversionary structures not uncommonly take the form of chimæras, which often consist of the intermediate type and one of the pure species. It is scarcely necessary to point out the

ORCHID NOTES AND GLEANINGS.

CATASETUM SEEDLINGS.

A REMARKABLE example of the profuse manner in which Orchids from seeds may be raised in a suitable house may be seen in the gardens of J. S. Bergheim, Esq., Belsize Court, Hampstead (gr. Mr. H. A. Page). A few months ago Mr. Bergheim brought a small collection of native Orchids from Trinidad, among which was a mass of *Catasetum macrocarpum*, bearing several large mature seed capsules. The plants were potted, and in due time the fruits burst and the seeds became distributed, some of them finding their way to the water tank. The result is that on the surface of the pots, the sides, and in every conceivable situation there are strong seedling *Catasetums*, up to 2 or 3 inches in height. *Osmunda* fibre seems to be specially favourable for the germination of the seeds and growth of the young plants.

ANGULOA UNIFLORA EBURNEA.

It is the custom to call the best and largest white *Anguloa*, *A. eburnea*, but a batch in flower in Tracy's Nursery, Twickenham, collected in the locality in Peru, whence the type specimen of the genus named *Anguloa uniflora* Ruiz et Pavon was obtained, shows that it is typical *A. uniflora*. In view of the extreme variability of the species, which is widely distributed, and the inferior quality of the flowers on the plants from some localities, the name *eburnea* might well be added to distinguish the best Peruvian form. Some 50 plants have borne their large, aromatic white flowers for several weeks past, and they are still good. The *Anguloas* are here grown tolerably cool with the *Lycastes*, the house being well shaded. The rare *Anguloa uniflora* Turneri, with blush-white flowers, the fine citron-yellow *A. Cliftonii*, which has bright purple markings inside the segments, and several forms of *A. Ruckeri* have recently been in flower in this nursery, and the large, light-yellow flowers of *A. Clowesii* are still making a good display.

VEGETABLES.

WINTER SPINACH.

WINTER Spinach is a most useful vegetable that is highly appreciated in its season. The seeds should be sown about the middle of August or soon afterwards, in ground which has been previously well prepared. They are best sown in shallow drills drawn at about 18 inches apart; make the ground fairly firm by treading before drawing the drills, and see that the soil has been worked into a fine tilth. On very heavy soils it is necessary to throw up ridges about 6 inches high and about 1 foot wide at the top.

The seedlings should be thinned early to about 9 inches apart, the bed kept well hoed, and every endeavour made to promote a sturdy growth.

Slugs are very troublesome to Spinach, and these must be kept in check by frequently dusting the bed lightly with soot, which will also act as a stimulant to the plants if stirred into the soil by the hoe.

The prickly seeded variety is generally recommended for winter use, but I have grown both this and round-seeded or summer Spinach side by side, and find the latter variety equally as good and hardy. In addition to the Spinach, a good bed of Spinach Beet always proves useful, but the seeds of this need to be sown in July. *Wilmot H. Yates, Rotherfield Park Gardens, Alton.*

FIG. 78.—FLOWERING SPRAY OF CYTISUS PURPUREUS.

(This species when budded on *Laburnum vulgare* produced *C. Adami*. See fig. 77.)

tained. We are greatly indebted to Prof. Winkler for permission to reproduce his figure of one of these types (*Solanum tubingenense*, fig. 76).

These plants present features which correspond exactly with those of the earlier known graft hybrids, and they have the same tendency to produce reversions to one or other of the parental types in their lateral organs (see fig. 76). As well as complete reversions to the

complete analogy between such a chimæra and the "partially reverted" shoots so often described in *Cytisus Adami* (fig. 77), &c. The *Solanum* graft hybrids, however, sometimes produce more complex chimæras, and in one case no fewer than five different types—the two pure species and three of the intermediate forms—were combined in a single adventitious shoot. *R. P. Gregory.*

(To be continued.)

THE PRIMULAS OF THE EUROPEAN ALPS.

(Continued from p. 132.)

HYBRIDS.—II.

WHEREVER in the Alps you find two species of *Primula* growing freely, there you may hopefully hunt for their hybrid, so freely do the different species interbreed. *P. minima* heads the list of parents, having, as pollen-parent or seed-parent, produced no fewer than eight named hybrids. Some hills it shares with *P. spectabilis*, some with *P. glutinosa*, some with *P. Clusiana*, some with *P. Wulfeniana*, some with *P. hirsuta*, and one at least with *P. tyrolensis*. And from every one of these associations springs a lovely hybrid, in many cases much easier to grow than its parents, and in all cases possessing *P. minima*'s laudable indifference as to lime or granite. The next in family is *P. Auricula*, with six hybrids; and the third *P. hirsuta*, with five. Hybrids between species in the same subsection are very rare, e.g., *P. hirsuta* × *P. cœnensis*, while certain subsections seem wholly unable to interbreed. There are no crosses between the *Euauriculas* and the *Arthritica*, or *P. minima*, or *P. glutinosa*.

CROSSES OF PRIMULA AURICULA.

P. Auricula × *P. carniolica* = *P. venusta* (Host).—A well-known and splendid plant (*P. Jelenkæ* and *P. idriana* of Gusmus), varying between its parents, but differing from *P. Auricula* in having rosy flowers, and from *P. carniolica* in having leaves more or less farinose. This hybrid occurs with its parents in the Idria district occupied by *P. carniolica*. I am quite certain that its citation from Mte. Baldo is owing to a confusion between the elongate forms of *P. spectabilis* (in shady cliff crevices) with *P. carniolica*, whose range is far away to the east. *P. venusta* is a fertile hybrid, yielding further intermediates. In particular, it has fertilised *P. marginata*, which has thus produced the beautiful *P. Marven*, with foliage approaching to that of *P. carniolica*, but with dark-violet flowers.

P. Auricula ciliata × *P. tyrolensis* = *P. obovata* (Huter).—A very remote, rare, and obscure alliance, the proof of which rests only on two specimens from the Belluno Alps.

P. Auricula × *P. integrifolia* = *P. Escheri* (Brügger) differs from *P. Auricula* in having leaves faintly margined, short pedicels, few-flowered umbels, and long-calyxed, farinose flowers, of a dull red; from *P. integrifolia* in an occasional dentation to the leaves, and in a farinose calyx and bloom. This is a very rare cross from the West Rhaetian Alps. I do not know it.

P. Auricula × *P. pedemontana* = *P. Sendtneri* (Kellerer).—A garden hybrid (the two species do not occur in the same districts) not yet described.

P. Auricula × *P. cœnensis* = *P. discolor* (Leybold: *P. Portæ*, of Huter).—This cross is indefinitely variable between either parent—more or less like *P. Auricula*, more or less like *P. cœnensis*. It is also freely fertile, and its seedlings (crossed again with either of the grandparents) prolong the range of variety and confusion. However, the intermediacy between *P. Auricula* and *P. cœnensis* remains always recognisable, though this cross is only differentiated from the appalling welter of confusion covered by the name of the next, by the possession of rufous glands on the leaves (which are occasionally narrower than in *P. pubescens*). The flowers are usually purplish, but occasionally of a yellowish-white. *P. discolor* occurs in the southern limestone Alps of Judicaria, but is not common.

P. Auricula × *P. hirsuta* = *P. pubescens* (Jacq.).—But not only has this name also got to cover all the crosses of *P. Auricula* × *P. villosa* as well, and all the crosses of *P. Auricula*

× *P. viscosa* too; but it has also had the following synonyms, every one of which very often appears separately in the same catalogue, and every one of which must be finally discarded:—*P. rhaetica* (Gaud), *P. helvetica* (Donn), *P. alpina* (Schleicher), *P. intermedia* (Van Houtte), *P. Göblii* (Kerner), *P. Arctotis* (Kerner), *P. Kernerii* (Göbl.), and *P. Peyritschii* (Stein).

When it is remembered how wide a gulf separates *P. hirsuta* from *P. viscosa*, it will easily be seen that a name which is intended to cover all hybrids of both these species with *P. Auricula* can only be described as a cry of despair. It results that *P. pubescens* is a name even more vast and wild than *Saxifraga aizoon*: there is no analysing this series of hybrids. "More or less" has to be appended to every descriptive detail. Wherever *P. Auricula* occurs with *P. viscosa*, *P. villosa*, or *P. hirsuta*, there their bewildering polymorphic children are sure to be found. In culture, *P. pubescens* is the oldest of all hybrid *Primulas*. Clusius saw it in the rich garden of Dr. J. Aicholtz, at Vienna, about 1580, and understood it to abound in the Cœnipontine Alps. And *P. pubescens* is still, perhaps, the most important of hybrid garden *Primulas*, for the name covers every florist's "*Auricula*," green-edged, Alpine, or border, and such a multiplicity of other forms, too, that the brain reels in contemplation. There are, in particular, two albinos, called by catalogues *P. "nivalis"* and *P. "helvetica"* alba. They are both of them, of course, according to present classification, *P. pubescens* alba. *Ut mihi videtur, absurde*, since the one is much nearer to *P. hirsuta*, and the other to *P. villosa* (in shape of flowers); the form called *P. "nivalis"* being the commoner, and that called *P. helvetica* alba much the more beautiful, taller in the scape, with wider flowers, less serried in the umbel. There is also an absolutely different albino *P. pubescens*, which is typical *P. Auricula* × *P. viscosa* alba. This plant, a very old inhabitant of some north-country gardens, has the habit of *P. viscosa* almost pure, with dense, one-sided bunches of narrow, white flowers, carried on tallish stems, the whole plant tending to grow stalkily out of the ground. Finally, as a small straw to cling to in the maelstrom of confusion—*P. pubescens*—it may be remembered that the hybrid is, by preference, of almost every colour in the rainbow except *Auricula*'s golden-yellow; while it differs always from *P. hirsuta*, *P. villosa*, *P. viscosa* in being less hairy, and also, usually, to a certain extent, farinose in some of its parts. But the name of *P. pubescens* is hopelessly strained and artificial, especially as the primary hybrids are fertile, and fertile again, to the third and fourth generation. There is, for instance, a beautiful violet-flowered *P. decora* (of gardens); it is a distinct enough form of *P. pubescens*, but its seedlings yield only border *Auriculas* in every imaginable colour. *Reginald Farrer.*

(To be continued.)

COLONIAL NOTE.

TROPÆOLUM SPECIOSUM.

WHEN in Ireland, a year ago, I observed a plant of *Tropæolum speciosum* which had apparently become naturalised. It was growing in a Thorn hedge in a field near the nursery of Messrs. Reamsbottom & Co., at Geashill, King's County, and had evidently escaped from that establishment. The plant had taken root in the thickest part of the hedge, and was doing remarkably well. When in flower, it made a flaming patch of red, and, being on a hillside, was visible for at least a mile. It would be interesting to know how it got into this position, unless the seed was carried by a bird. I wish it could be induced to grow in this tropical climate. *G. St. C. Feilden, Botanical Station, Tobago, W. Indies.*

THE DEVELOPMENT FUND.

PROMOTION OF AGRICULTURAL RESEARCH AND LOCAL INVESTIGATIONS.

WE have received the following information from the Board of Agriculture and Fisheries, dated August 25, 1911:—

The Board of Agriculture and Fisheries have been in communication with the Development Commissioners with a view to the formulation of a scheme for the promotion of agricultural research and local investigations in England and Wales, and the Treasury, on the recommendation of the Commissioners, have now sanctioned the allocation of funds to be distributed by the Board in accordance with the general principles set out below. The total maximum sum which will be expended when the scheme is in full operation will be about £50,000 per annum.

The scheme provides for—

1. A system of agricultural research which will secure for each group of the problems affecting rural industry a share of attention roughly proportional to its economical importance;
2. The concentration of the scientific work on each group at one institution or at institutions working in combination;
3. Grants for special investigations for which provision may not otherwise be made;
4. The grant of scholarships with a view to the increase of the number of men fully qualified to undertake agricultural research;
5. The carrying out of investigations into problems of local importance, especially those involving the application of modern research to local practice, and the provision of scientific advice for farmers on important technical questions.

SUBJECTS OF RESEARCH.

In making arrangements for the separate investigation, as far as possible, of each group of allied subjects, the Commissioners and the Board have been impressed with the importance of securing continuity in work which is necessarily of considerable duration, and at the same time of providing staffs of specialists and experts who will be permanently engaged on work arising from the investigation of the same group of problems. By this means, concentration and economy of effort will be better secured than it would be if a number of institutions were dealing at the same time with the same group of problems.

It is neither desirable nor possible to prevent all overlapping or duplication of work, but it is obviously necessary to proceed on a plan by which research work subsidised from public funds will not be unnecessarily duplicated. It is also desirable to arrange that each problem shall be undertaken by the institution best fitted to deal with it, and usually by the institution which has specially devoted its attention to problems of an allied nature.

It is also important to avoid the giving of undue attention to one part of the field of agricultural research, to the exclusion of other parts which are of equal scientific and economic importance.

With these considerations in view, it has been arranged that grants should be made for research in the following groups of subjects:—

1. Plant physiology.
2. Plant pathology and mycology.
3. Plant breeding.
4. Fruit growing, including the practical treatment of plant diseases.
5. Plant nutrition and soil problems.
6. Animal nutrition.
7. Animal breeding.
8. Animal pathology.
9. Dairying.
10. Agricultural zoology.
11. Economics of agriculture.

SPECIAL GRANTS FOR RESEARCH.

A sum not exceeding £3,000 per annum will be available for assistance in respect of special

investigations for which provision is not otherwise made.

Grants from this fund will be made on the recommendation of the Board's Advisory Committee on Agricultural Science, who will consider not only whether the proposed investigation is desirable in itself, but whether it could not be better carried out at one of the special research institutions referred to above. The grants will be made from year to year, and will be for one year only in each case.

SCHOLARSHIPS.

In order to secure the services of a number of carefully-trained men for work in connection with the scheme, the Board propose in each of the years 1911, 1912, and 1913 to offer 12 scholarships of the value of £150 per annum, tenable for three years.

It is proposed that candidates for scholarships should be selected by a special committee, representing the institutions under whom the selected candidates will subsequently work. The award of 12 scholarships will be conditional on a sufficient number of thoroughly suitable candidates presenting themselves.

LOCAL ADVICE AND INVESTIGATIONS.

Grants will also be made to certain Universities, University Colleges, and Agricultural Colleges in England and Wales for the purpose of enabling them to supply scientific advice to farmers on important technical questions and to carry out investigations into problems of local interest, which can be more conveniently studied on the spot than at one of the research institutions.

By means of these grants it is hoped to provide an expert staff, possessing both scientific and practical qualifications who will devote themselves to solving difficult local problems, and in other ways endeavour to secure the application of science to practice.

TREES AND SHRUBS.

COLUTEA ARBORESCENS.

THE present interest in the Bladder Senna lies in its very attractive fruits, which, this season, have assumed a much-higher colour than usual. From the planter's point of view, it is satisfactory to know that this deciduous shrub has a very accommodating nature. It does not seem to matter how dry and poor the soil may be, the Bladder Senna will thrive when once it has become established. When we remember that it grows on the ascent to the crater of Mount Vesuvius it is not surprising to find how well the shrubs have withstood the prolonged drought.

On the Continent the leaves were formerly used as a substitute for the true Senna, which is composed of the leaves of several species of Cassia. The seeds, in small doses, are said to excite vomiting. When pressed the very large bladder-shaped fruits burst open with a loud crackling noise, and disclose a row of small seeds, which become ripe towards the middle of September. The pale-green leaves, which are of the character common to the order Leguminosæ, look somewhat small now that the shrubs are loaded with their large seed-vessels.

KÆLRUTERIA PANICULATA.

THIS handsome, flowering tree is so rare in gardens generally that it is a pleasant surprise to see an unusually fine specimen. In the Cumberland Road, Kew, a very healthy tree has just completed its flowering, and now bears a great number of its curious, bladder-like fruits. The example under notice is fully 20 feet high, with plenty of rich, green leaves, and is much more shapely than is customary; generally the few specimens to be met with have a straggling habit. This tree is perfectly hardy, and it succeeds well in ordinary garden soil. A. C. Bartlett.

THE FLOWERS OF CHAUCER.

(Concluded from p. 147.)

VALERIAN.

Egrimoigne, valirian, and lunarie.
Prologue of the Chanounes Yeman, III. 32.
See "Cetwall."

VINE.

1. Som time a vine, and grapes white and rede.
Frankelynes Tale, II. 240.
2. Alle her olyvers and vynes eeke.
Monkes Tale, III. 188.
3. The foule toode, that may nought endure
the soote smel of the vine roote, whan it
florischi. *Persones Tale, IV. 61.*
4. The olive of peace, and eke the dronken vine.
Assembly of Foules, IV. 195.
5. With a boore as grete as ox in stalle,
She made up frete hire corne and vynes alle.
Troilus and Cryseyde, VI. 38.

VIOLET.

1. The Primerose, the violete and the gold.
Court of Love, IV. 183.
2. Ne violete, ne eke pervynke.
Romaunt of the Rose, VII. 43.
3. There sprang the violete alle newe.
Ib. 60.

WALNUT.

I saugh hym carien a wynd-melle
Under a wal-note shale.
House of Fame, VI. 236.

Shale is the shell. The Walnut was introduced into England by the Romans, and was probably abundant in Chaucer's time.

WHEAT, including Corn.

1. He schal have multiplying of his grayn,
Whan he hath sowen, be it whete or otes.
Prologue of the Pardoner, III. 70.
2. Nought but the mountaunce of a corn of
whete. *Pardoner's Tale, III. 86.*
3. He wolden sowen som difficultee,
Or springen cockle in our clene corne.
Schipmannes Tale, III. 91.
4. And thay brent alle the cornes of that lond,
Alle her olyvers and vynes eeke.
Monkes Tale, III. 188.
5. Why schuld I sowen draf out of my fest,
Whan I may sowe whete, if that me lest?
Prologue of the Persones Tale, IV. 6.
6. Out of the old fieldes, as men saith,
Cometh all this newe corne fro yere to yere.
Assembly of Foules, IV. 188.
7. In the field, that was on every side
Covered with corn and grasse.
Flower and the Leaf, IV. 239.
8. She made up frete hire corne and vynes alle.
Troilus and Cryseyde, VI. 38.
9. Pipes made of grene corne.
House of Fame, VI. 234.
10. Proud Bayard gynnyth for to skippe
Out of the wey, so prickith him his corn.
Troilus and Cryseyde, V. 25.

WHIPPELTREE.

Hasil, ew, wyppyltre.
Knightes Tale, I. 182.

The Whippeltree is the Cornel.

WILLOW.

Wilw, elm, plane.
Knightes Tale, I. 182.

See also Sallow.

WOODBINE.

1. To make him a garland of the greves,
Were it of woodewynde or hawthorn leves.
Knightes Tale, I. 136.
2. Some ful pleasantly
Had chapelets of woodbind.
Flower and the Leaf, IV. 242.
3. Some of hawthorne, and some of the wood-
binde. *Ib. 246.*
4. And tho that weare chapelets on their hede
Of fresh woodbinde.
Flower and the Leaf, IV. 255.

5. And, as aboute a tre with manye a twiste
Bitrent and writhen is the swete woodbynde.
Troilus and Cryseyde, V. 158.

6. Betwex an hultere and a wodebynde.
Complaynte of a Loveres Lyfe, VIII. 10.

Woodbine was applied to many clinging shrubs, but in Chaucer's works it seems always to have meant the Honeysuckle. It was the established "emblem of faithful attachment, for it winds itself so firmly round some stronger tree that it becomes fixed in the bark."

YEW.

1. Fyne ew, popler, and lyndes faire.
Romaunt of the Rose, VII. 59.
2. The shooter ewe.
Assembly of Foules, IV. 195.

The Shooter Yew is so called from its use for bows.

The Yew completes the list of Chaucer's flowers. There are many passages in which he describes beautiful gardens. It is very tempting to quote them, but I will content myself with one only:—

May had peinted with his soft schoures
This gardeyn ful of leves and of floures:
And craft of mannes hond so curiously
Arrayed had this gardeyn trewely.
That never was ther gardeyn of suche pris,
But if it were the verray paradis.
The odour of floures and the fresshe siht,
Wold han y-maked any herte light
That ever was born, but if to gret sikenesse
Or to gret sorwe held it in distresse,
So ful it was of beaute and plesaunce.
Frankelynes Tale, II. 232.

I think I may say that Chaucer has given us a goodly collection of flowers, but I am rather surprised that he has not given us more. He was evidently fond of the country, and was an admirer of fine woods and forests. He was also a travelled man, and he travelled with his eyes open. As far as we know, neither Gower, Spenser, nor Shakespeare were ever out of Great Britain, but Chaucer had travelled in Flanders, France, Switzerland, and Italy, yet he gives no proof that the flora of any of those countries had given him any pleasure, or that he had at all noticed any difference between the flora of England and the flora of other countries. But he is quite original, and in his description of the flowers he is different from Spenser and Shakespeare. He did not, like Spenser, put flowers into his poetry because he had read of them in the Greek and Latin classics, and he almost nowhere gives us the minute, loving descriptions of the flowers that he saw and admired that we find in Shakespeare. The one exception is the Daisy; of that one flower he is the poet laureate. I think he was attracted far more by the flowers in a well-kept garden than he was by the flowers of the meadows, woods, and hedgerows of England.

But we may be thankful that he has picked for us so many flowers, and it has been to me a great pleasure to have gone through his works in search of them, and to have been obliged to go through them very carefully. In searching for flowers in an author's writings, every line must be read carefully; skipping is fatal, but in the case of Chaucer the labour of careful reading is very fully repaid. He is a delightful writer, full of wit and wisdom, and to read his works is an education in old English literature at its best. The vigour of his language is very fascinating, and we see the justice of Spenser's description of him as "the well of English undefiled." If the readers of the *Gardeners' Chronicle* are tempted by my papers on Chaucer's flowers to study his works carefully, I can say with all confidence that they will not be disappointed. H. N. Ellacombe, Bitton Vicarage, Bristol.

THROUGH LITTLE NAMAQUALAND WITH THE VASCULUM AND THE CAMERA.*

(Continued from p. 125.)

If the title permits us to make a short excursion outside the limits of Namaqualand proper, we may descend on the eastern side of the Khamiesberg into the plains of Bushmanland. These plains are particularly attractive in January, when the grasses and other vegetation have recently been awakened by the summer rains. Some prominent features of this interesting but little-known country were described in *Gardeners' Chronicle*, December 4, 1909, p. 369. We are especially concerned just now with the hill, the Koeberg, which is seen in the distance in fig. 80. The Koeberg, the summit of which is not more than 500 feet above the plain in which it stands, together with a few less elevated hills in its immediate neighbourhood, is separated by 25 miles of undulating plain from the eastern foot-hills of the Khamiesberg. A magnificent view of the range to the west and south-west is obtained from the summit. In other directions the plains reach the horizon, except to the north, where the sky is pierced by the hill-tops of the Orange River basin.

The isolation of the Koeberg, on the one hand from the mountains of Namaqualand and on the other from similar abrupt elevations which are so characteristic of some other parts of Bushmanland, gives a peculiar interest to its vegetation. Its elevation is so slight, it seemed possible that its plants might be, in the main, those of the plains on which it stands. On the other hand, the species which are most characteristic of Bushmanland are sand-dwellers, and, according to report, the slopes of the Koeberg were rocky. If this proved to be correct, one might expect to find the bushes and trees of *Ficus*, *Acanthaceæ*, *Portulacææ*, *Asclepiadaceæ*, *Compositæ*, and *Leguminosæ*, which flourish on such hills 50 miles away to the north and east. Neither of these anticipations was realized. The flora proved to be a rich one, and almost entirely composed of succulents, most, possibly all, of which are to be found on the lower slopes of the mountains of Namaqualand—Cras-

lents, particularly by representatives of the first four genera named. A couple of grasses have strayed up from the plains below, and the quartz and granite rocks which compose the surface are decorated by numerous lichens. Such characteristic Namaqualand species as *Aloë dichotoma* and *Vogelia africana* seemed to be absent.

FIG. 80.—BUSHMANLAND.

A view of Koeberg from the neighbourhood of Gounoep, looking south-east.

Most of these plants were not in flower in January. The principal flowering season is said to be in September, as in Namaqualand, and the general appearance of the vegetation was such as to lend support to this statement. We have then in the Koeberg a rather remarkable example of a low hill bearing spring-flowering species rising from a plain where the vegetation is dormant or dead until the summer is far advanced. The district is quite uninhabited, and it is not easy to penetrate so far into this corner of Bushmanland except when the fitful summer rains have supplied the few shallow basins with water, which

plants to retain the flowering habit, presumably inherited from Namaqualand ancestors, remains a problem of much interest. However this may be, Koeberg at present is, botanically, an outlier of Namaqualand.

On re-entering the mountainous region of Namaqualand, we have an opportunity of seeing the junction of the flora of the plains with that of the hills. This is indicated by the gradual decrease in importance of the grasses with a corresponding increase in the relative abundance of the *Mesembryanthemums*. A remarkable plant which has been found in the three localities in which this boundary zone has been crossed is shown in fig. 79. This is a species of *Euphorbia*, which varies in height from a few inches to 2 feet or perhaps more. It consists of a stout conical axis quite concealed by the short, densely-packed branches which bear the few narrow leaves and the flowers. A living plant has reached Kew Gardens.†

It may be safely asserted that the phanerogamic flora is not yet fully known for any part of Namaqualand. Perhaps no part has been less studied than that which lies to the north of a line drawn from Port Nolloth to O'okiep. Through it runs the old missionary and trade route to Great Namaqualand, crossing the Orange River at a point variously known as Sendling's, Bethany, or Missionary Drift. The mountainous country extending for several miles south of the river is generally called the "Richtersveld," a name which perpetuates the association with the early missionaries. Starting from Annenous, a station on the Port Nolloth-O'okiep Railway, the road to the drift, frequently degenerating to a mere track, passes over plains of heavy sand, along stony river-beds, up and down steep and rough mountain slopes. Throughout its whole length it lies in the extensive native reserve, whose Hottentot population is mostly attached to the Rhenish Mission, which has its headquarters at Steinkop. Its waters are few and far between, and most of them are more or less saline. On the whole, it is a region in which travel by the beaten track is neither comfortable nor easy, while the results of taking a wrong turning are not unlikely to be deplorable. But the vegetation is of exceptional interest, and grievances, real or imaginary, become insignificant.

Annenous is on the edge of a sandy plain about 2,000 feet above the sea. On this plain two very remarkable plants are found in great abundance. One of these, *Sisyndite spartea*, a member of the *Zygophyllum* family, at once attracts attention on account of its large lemon-coloured flowers and its stiff broom-like habit. It was first obtained by Diège, not far from the mouth of the Orange River. Harvey figured and described it,‡ and suggested the very suitable name "Desert Broom." As to the extent of its area of distribution, there was no further information until it was found in Bushmanland and elsewhere by the Percy Sladen Expedition in 1909. It was then ascertained that it occurs in sandy localities at elevations hardly exceeding 3,000 feet between Aggenys in Bushmanland and Buchholzbrunn in Great Namaqualand, a distance of nearly 200 miles. Throughout this region rain is experienced during the summer season. At the mouth of the Orange River, as also at Annenous, the principal rainfall occurs in the winter. But, as has been mentioned earlier, there is a summer rainy season in which the rainfall is undoubtedly inconstant but still sufficient to support a much larger proportion of summer-flowering species than can exist in the more southerly districts of Namaqualand.

Among them are numbers of forms which occur also in Bushmanland; of these *Sisyndite spartea* is a conspicuous example. Species which are common to the Bushmanland plains and to Namaqualand are almost confined in the latter

FIG. 79.—RATELKRAAL, ON THE TRANSITION-ZONE BETWEEN BUSHMANLAND AND NAMAQUALAND.

The hills in the background bear typical Namaqualand vegetation. The perennial plants of the plain are chiefly *Mesembryanthemums*. In the middle distance are seen three specimens of a curious *Euphorbia* which appears to be a characteristic species in the transition-zone.

sulas, *Cotyledons*, *Euphorbias*, *Mesembryanthemums*, *Asclepias*, *Sarcocaulon*, *Stapelia*, *Trichocaulon*, *Kleinia* and a single *Aloë*. A few dwarf bushes (*Montinia*, *Amarantaceæ*, *Pteronia*, *Thesium*, &c.) are by far outnumbered by the succu-

quickly disappears. There is, therefore, no precise information as to the weather conditions prevailing here during the winter. But it is quite improbable that the hill receives any considerable rainfall except in summer. The presence of lichens, however, suggests the deposit of moisture from fogs during the winter. But the nature of the climatic conditions which enable the Koeberg

* Being some notes on the Percy Sladen Memorial Expedition to the Orange River, 1910-11. This expedition was assisted by a grant from the Royal Society.

† *Kew Bulletin*, 1911, p. 168. (A pyramidal succulent species of *Euphorbia*, in general appearance not unlike a small, densely-packed plant of *Brussels Sprouts*.)

‡ *Thesaurus Capensis*, ii., 120.

region to sandy localities. The dry, sandy banks of the Orange River and the (usually) dry beds of its tributary streams seem to furnish a suitable passage by which plants may spread from the one to the other. This in itself affords some explanation of the fact that the species and genera common to the two areas are much more abundant within 50 or 70 miles of the river than they are farther south; the existence of a moderate rainy season in the summer may therefore be of less importance than has been suggested above.

If only on account of its beautiful flowers, which are produced in great profusion, the "Desert Broom" is certainly worthy of cultivation. Seeds were sent to England in 1909.

Not less interesting than *Sisyndite* is a curious *Mesembryanthemum*—*M. Barklyi* (see fig. 81)—to which reference has already been made. Unlike *Sisyndite* this is a characteristic Namaqualand species, ranging northwards from the southern end of the Khamiesberg to the Orange River, and no doubt for some distance beyond it. Some young seedlings found on the sandy plains between O'okiep and Koeberg may perhaps have belonged to this species, but its occurrence in Bushmanland is doubtful. From Annenous northwards it is very abundant, frequently growing gregariously, and in this manner

to 15 feet. It was not in flower in January, and if it has been collected by earlier travellers the specimens seem to have attracted no attention. Unfortunately, a seedling plant sent to Kew did not survive the voyage. *H. H. W. P.*
(To be continued.)

SCOTLAND.

THE ROSE SEASON.

ROSES have had great difficulties to contend against by reason of the prevalence of dry weather, especially in such gardens as those of Logan House in this parish, for which water during that protracted period could hardly be obtained. Fortunately for my own garden, gravitation water was introduced into this "Paradisus Terrestris" many years ago, simultaneously with its first introduction into the manse. This inestimable advantage, to a great extent, saved the situation; but, after all, one very soon discovers from ordinary observation of the development of Roses, that nothing can quite make amends for the absence of rain. By far the most successful of my Roses this season are the beautiful *Wichuraianas*, such fine varieties as *Dorothy Perkins*, *Hiawatha*, *White Dorothy*, *Lady Gay*, and *Christian Curle* (of

been magnificent in dimensions and radiant in colour; *La France*, which merits an almost equally high eulogium; *Frau Karl Druschki*, the Queen of H.P.s, and *Margaret Dickson*, which flowers in my garden at an abnormal elevation, sometimes approximating to 20 feet; *Prince Arthur*, which has grown better than Duke of Edinburgh; *Clio*, which is always grandly effective; the distinctively coloured and grandly fragrant *J. B. Clark*; *Hugh Dickson*, which is a more refined and equally odorous Rose; *Mrs. Sharman Crawford*, *Lady Helen Stewart* (hardly so prolific as it was last year), and the luminous *Captain Hayward*, one of the most decorative, and assuredly the most reliable of the crimson varieties. Up to the present period, the most splendidly effective of all my climbing Roses have been *Bouquet d'Or*, *Mme. Alfred Carrière*, and the marvellous *Waltham Bride*, which have flowered continuously.

Of Roses of recent introduction the most successful have been *Juliet* (a strong grower, with uniquely coloured flowers and richly-scented foliage); *Viscount Carlow*, a very beautiful Irish Rose that should hereafter be found in every Rose garden; *Duchess of Wellington*, which is sufficiently sparing of its exquisite flowers; *Lady Pirrie*, of highly distinctive and fascinating complexion; *Miss Alice de Rothschild*, a "garden" *Marechal Niel*; and *Mrs. Leonard Petrie*, an attractive yellow Hybrid Tea. *David R. Williamson*, *Manse of Kirkmaiden*, *Wigtownshire, N.B.*

ABERDEEN AND NORTH OF SCOTLAND COLLEGE OF AGRICULTURE.

THE calendar of this college, just issued, gives details of the scheme of instruction for the session 1911-1912. The courses of instruction provided for farmers includes lectures on soils, methods of cultivation, plant life, manures, feeding stuffs, diseases of animals, live stock, &c. Lectures in the branches of agriculture and agricultural chemistry are arranged in a series of three years. The syllabus includes fifty lectures on forestry, specially useful for intending factors, land stewards, land owners, and all who have to do with the management of the land. Those who wish to prepare for the Forestry Diploma granted by the Highland and Agricultural Society of Scotland, a further course, extending over an additional fifty meetings, for lectures and practical work will be necessary. For foresters, a course of instruction, extending over four weeks, is held in Aberdeen from the middle of August to the middle of September. The course consists of lectures, excursions, and demonstrations, and is specially intended for foresters with practical experience. Courses in botany, zoology, and school gardening have been given to students in training at the training college centre under an arrangement with the Provincial Committee for the Training of Teachers.

RAILWAY STATION GARDENS.

THE usual prizes having been offered by the directors of the Glasgow and South-Western Railway Company for the best-kept gardens on their system the following awards have been made by the judges. First class, £6 each: *Dalmellington*, Mr. W. Taylor; *Racks*, Mr. J. Craig; *Montgreenan*, Mr. E. Blackwood; *Lochanhead*, Mr. J. Mirrey; *Cunninghamhead*, Mr. J. Hamilton; *Glenside*, Mr. Frank Stoddart. Second class, £4 each: *Sanquhar*, Mr. W. Yeudall; *Maxwelltown*, Mr. J. S. Faulds; *Maybole*, Mr. T. L. Kerr; *Moniaive*, Mr. G. Macdonald; *Saltcoats*, Mr. T. Frew; *Closeburn*, Mr. T. Faulder; *Killywhan*, Mr. R. Kelly; *Paisley West*, Mr. G. Hay. Third class, £3 each: *Carronbridge*, Mr. W. B. Dunlop; *Kirkgunzeon*, Mr. H. Patrick; *Kilkerran*, Mr. J. Reid; *Maidens*, Mr. J. Taylor; *Dunure*, Mr. W. R. Becket; *Alloway*, Mr. T. Gillies. Fourth class, £2 each: *Gretna Green*, Mr. T. Gibson; *Tarbolton*, Mr. J. Reid; *Mauchline*, Mr. J. O'Hagan; *Houston*, Mr. R. Harvey. Fifth class, £1 each: *Auchincruive*, Mr. W. O. Walker; *Southwick*, Mr. G. Wallace; *Holywood*, Mr. M. M'Cardle; *Pinmore*, Mr. J. Dunlop; *Newtonards*, Mr. J. M'Dougall; *Knoweside*, Mr. F. Stoddart. In accordance with the rule debarring those who have won prizes in succession, several stations were not in the competition, and next year *Glenside*, *Lochanhead*, and *Racks* cannot compete.

FIG. 81.—MODDERFONTEIN.

Mesembryanthemum Barklyi. The stem of a thermometer projects from the plant in the left foreground. On the right, behind the heap of broken stems and leaves, the species is represented by a large number of plants growing gregariously.

covering acres of space almost to the exclusion of other vegetation. It is all but confined to sandy and fairly level ground. It was discovered by Sir Henry Barkly, whose name it bears. Its peculiar habitat can hardly be more accurately described than in the words of its discoverer:—"The main stem reaches a height of 2 feet, branching out into flower-stalks at the top, whilst near its base a whorl of branches spring out, running for a foot or two along the ground, and then sending up upright flower-stalks." The flowers vary in colour from deep pink to a pure white. The leaves are thick and heavy with water, which oozes out on the surface; it is not possible to touch the surface at any time of the day without wetting the hand. Notwithstanding its large size, this species is probably an annual.

Mr. Brown in his description of this extraordinary plant says: "This is the largest species of *Mesembryanthemum* that has yet been discovered." Namaqualand, however, contains a much larger one, whose area of distribution seems to be included within that of *M. Barklyi*. This is a bush with a thick, woody stem; it is commonly 4 or 6 feet high, and one specimen measured not far from the Orange River ran up

which the last-mentioned, raised by Messrs. Cocker, is invaluable for garden decoration in early autumn). In addition to their great beauty, they have this special qualification, that they come into bloom during what is usually spoken of as the intermediate season; the period of repose between the first and second flowering of the Hybrid Perpetuals, the Teas, and Hybrid Teas. One of the loveliest of the semi-*Wichuraianas* (a term signifying that they have been partly derived from the *Noisettes* or Teas), namely, *Gardenia*, seems to have great difficulty in growing or blooming adequately here. I saw it quite recently in all its glory at Sir Mark Stewart's Southwick Garden, in Kirkcudbrightshire, and the head gardener there was quite unable to understand why I should have such disappointment with this variety, whilst Paul Transon and other *Wichuraiana* derivatives succeed well. But in the profuse flowering of such glorious varieties as *Dorothy Perkins*, *Hiawatha*, and *Christian Curle*, I have much consolation. Of the older varieties among the Hybrid Perpetuals and Hybrid Teas, those that have chiefly distinguished themselves this season are *Caroline Testout* and *Viscountess Folkestone*, which have

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

ODONTOGLOSSUM.—The remarkable degree of popularity to which the members of this genus have attained is sufficient proof of their great value as flowering plants; this popularity is not to be wondered at, for under good cultivation the plants yield an abundance of flowers, and they are not unattractive when out of flower. Amongst the species, *O. crispum* in its varied forms, *O. Pescatorei*, *O. Hallii*, *O. Harryana*, *O. triumphans*, *O. luteo-purpureum*, *O. cirrhosum*, with their hybrids and varieties, take a front rank amongst spring and early-flowering Orchids. *Odontoglossums* are true Alpine plants, and a constant and regular circulation of air must always be maintained in the structures in which they are grown. The long spell of tropical weather during this summer made it impossible at all times to maintain a suitable temperature for cool-growing Orchids, no matter how heavily the glass was shaded or how free the ventilation afforded. The thermometer in the cool Orchid house at Westonbirt has frequently registered 90° F. during the middle of the day. From now onwards we may expect cooler nights—though the days may be hot and bright—therefore, the conditions will be more favourable for *Odontoglossums* and other Orchids which need a cool treatment.

AFFORDING NEW ROOTING MATERIAL.

The early autumn is generally regarded as the best season to renew the compost of such *Odontoglossums* as may require this attention. A thorough overhauling is usually necessary, including cleansing, re-potting, or surfacing, and re-arranging them for the winter. Re-potting is the most important item, and success will depend largely on how it is carried out. Wherever it is possible, do the work when the new growths are commencing to form roots. All the plants may not require re-potting; in some cases a surface-dressing will suffice, but the sooner either operation is carried out after the tips of the young roots appear the better, as the latter are then less liable to be injured. The compost and method of potting advised in the case of *Odontiodas* (see p. 108) may be adopted for *Odontoglossums*; overpotting must be rigorously avoided. No hard-and-fast rules can be laid down, but the more vigorous the plant and the larger the roots the rougher should the compost be and the larger the receptacle. Everything used should be thoroughly clean, and proper drainage materials must be provided. Specimens that have been left undisturbed for a few years, and are showing signs of exhaustion, should have all the old rooting materials shaken away, old and useless pseudo-bulbs removed, and new receptacles and fresh compost provided. Use pots just large enough to accommodate the plants for one season only. Healthy, root-bound plants needing more rooting space should be shifted, without disturbance of the ball, into larger pots.

AFTER-TREATMENT.—It is not advisable to keep the roots very moist for some time following root disturbance, but, as the new material will dry much more rapidly than the old, the plants will require frequent examination to ascertain if water is necessary. Plants that have been merely top-dressed are the more difficult to manage in watering, as sometimes the new material at the surface will be dry and that below quite wet. In doubtful cases the weight of the pot and its contents is the best guide. A comparatively dry state of the rooting materials is more conducive to early activity of roots than an unnecessary amount of moisture. Maintain a moist atmosphere in the immediate neighbourhood of the roots by damping bare surfaces in the neighbourhood of the plants, spraying the latter overhead two or three times daily in suitable weather. Give strict attention to ventilation and shading; the latter is an important detail after re-potting, but care must be exercised that the shading is not exces-

sive, for light is necessary to the young growths. Weakly and badly-rooted plants should be afforded the shadiest position, whilst any specimens that have not been re-potted may be allowed the lightest places. The house and stages should receive a thorough cleansing whilst re-potting is in progress, also the walls, glasswork, and woodwork. The moisture-holding material, such as shingle or coke, should be turned to destroy the green slime that is always present after a season's growth.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

PROPAGATION OF BEDDING PLANTS.—The propagation of tender plants employed for massing should be proceeded with, choosing as cuttings shoots that are neither unduly long nor soft. Some gardeners dibble the cuttings into pots, others into boxes; whichever method is adopted, allow plenty of space between the cuttings so that the plants may grow freely. Certain kinds need to be kept growing during the winter, and in their case it is imperative not to overcrowd them in the cutting boxes. Most plants root satisfactorily in cold frames kept close and regularly moistened. *Centaurea ragusina* should be kept somewhat dry and shaded, whilst *Mesembryanthemum cordifolium variegatum* should be always exposed to the sun, and not watered until the roots are active. The side growths of *Carnations* root freely in a sandy compost kept always soaking wet, and they do better in a slight bottom heat, such as is afforded by an old hotbed. If the shoots are allowed to flag they usually die.

HELIANTHUS.—The various sorts of Sun-flowers are now presenting a very gay appearance, and none is more beautiful than the variety *Miss Mellish*. The plant grows so tall at Tynninghame that most of the stems have to be shortened. But this only causes the buds lower down the stems to break, and is the means of lengthening the period of flowering. Where there is not much space for hardy herbaceous plants, the variety *Daniel Dewar* or some other early sorts should be intermixed with *Miss Mellish* to prolong the season. I prefer those of the perennial section to the annual kinds, of which many are very beautiful. An allied genus, *Tithonia*, furnishes glowing orange-coloured flowers in *T. speciosa*; the blooms resemble a single *Dahlia* rather than a *Sunflower*. *Helenium grandiflorum striatum* approaches nearest to it in colour, but is much less effective, producing dull flowers. Since writing of *Anemone japonica* in the calendar for July 29, p. 74, I have seen a fine new, white variety named *Géante Blanche*, with flowers $4\frac{1}{2}$ inches across and possessing thick, broad petals. This has not been a satisfactory season for *Astilbes*, but the old *A. Davidii* still holds its own amongst the newcomers; *A. grandis* is rather disappointing, and of the other hybrids I should be inclined to give *rubella* a high position. Though the ordinary mixed border is not to be compared with a wet position in the water garden as a home for these plants, yet some *Astilbes* are so highly attractive that they should be given a trial in the borders, assisting them with applications of manure water.

THE SEASON.—The intense heat has suited certain plants, which have seldom appeared so fine as this season. *Nasturtiums*, which usually make more leafage than flower, are smothered in blossoms. *Hollyhocks* are particularly brilliant, whilst *Ivy* and *Zonal-leaved Pelargoniums* and *Verbenas* have never been more gay. The many kinds of French and African *Marigolds* have also enjoyed the hot weather. These plants are not nearly so extensively grown as their merits warrant; the disadvantage in their use is their tendency to produce both single and double flowers which do not associate well in beds or borders. For this reason I always grow *Marigolds* in the kitchen garden until they reach the flowering stage, when the singles are weeded out from the doubles. *Heliotrope* has done well this year, although last season it was inferior, and *Carnations* have been extra good. Other plants that have benefited by the extra heat include *Romneya Coulteri*, *Colletia horrida*, and *Nandina domestica*. *Roses* are still flowering profusely, while some of the *Clematises* are still

presenting masses of colour. From all parts one hears of deficient supplies of border flowers. At Tynninghame we have had plenty of blossoms, but they have passed out of season quickly.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

VEGETABLE MARROW.—Plants of Vegetable Marrow should receive liberal applications of liquid manure whilst the dry weather continues. Thin out the worthless growths and cut the fruits before they grow large and become hard.

POTATOS.—There should be no delay in lifting and storing mid-season Potatos. Owing to the dry season the crop is a small one, but the tubers up to the present time show no signs of disease, and it is advisable to harvest them before rainy weather sets in. If sheds are available, the tubers may be stored as soon as they are lifted, covering them with mats or some other suitable material to exclude the light. Late varieties should be placed in a dry position for a week or two, and then carefully examined for diseased tubers, previous to placing them in clamps for the winter. Straw or dry Fern should be placed carefully over the tubers previous to covering them with a 9-inch layer of soil, which will be sufficient protection until frosts appear.

GREEN VEGETABLES.—The ground between rows of Colewort and other winter greens should be stirred frequently with a hoe, and all blanks in the rows made good. If necessary, further plantations of Coleworts may be made in sheltered places where the plants will grow to a useful size before very cold weather sets in. These late plants often withstand the winter better than those put out early in the season.

SPINACH.—Plants of the earliest batch of Spinach will be sufficiently advanced to require thinning. Allow a distance of 3 inches between the plants in the rows, so that they may not become drawn, as only sturdy specimens can withstand the winter. Give frequent dustings of soot, and hoe the ground between the rows as often as time will permit. Sowings of Spinach may yet be made in sheltered places to provide a supply of leaves for use during the spring.

CAULIFLOWER FOR SPRING PLANTING.—Seeds may be sown now, and again about the middle of September, to furnish plants for early summer supplies. In cold districts the first sowing may give the best results, but at Frogmore we sow on a date as near the middle of the month as possible. Choose ground which is not too rich and tread the soil firmly before the drills are made. Sow the seeds thinly in order to produce stocky plants, which should be potted as soon as they are large enough to be shifted. The soil for the purpose of potting should be not too light in texture; turfy loam with a sprinkling of rough sand will suit well. When potted, the plants may be stood on a bed of ashes in a cold pit, raised to within 15 inches of the roof-glass; the lights need not be used until the plants require protection from frost or heavy rains. We grow the varieties *Magnum Bonum*, *Walcheren* and *Early London*, and they are ready for use in this order.

TURNIPS.—Proceed with the thinning of seedling Turnips as soon as they are large enough, allowing a distance of 9 inches between the plants in the row. Give frequent dressings of wood ashes and use the Dutch hoe between the rows as frequently as possible.

RADISHES.—A sowing of Radishes may be made in cold pits to supply roots for use during October. The soil should be rich and light and kept well moistened with soft water to encourage a quick growth.

BASIL.—If this herb is required in a green state throughout the winter no time should be lost in sowing seeds. When the seedlings are large enough, they should be pricked off in 6-inch pots and placed as near to the glass as possible in a house having a temperature of 65°. From five to six plants should be allowed to each pot.

MINT.—If the beds of Mint were cut over a month ago, as advised, there should now be a plentiful supply of green leaves. The remainder of the crop should be cut down now and the roots lifted for forcing in October.

PLANTS UNDER GLASS.

By JAMES HUBSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

LILIAM LONGIFLORUM.—A batch of bulbs of this Lilium intended for flowering in mid-winter should be started soon. Some of the plants will probably flower in about four months, and others a few weeks later. It is not always expedient to select the largest bulbs; a firm, medium-sized bulb often gives the best results. The bulbs to be started now have been retarded, hence they should not be exposed long before they are potted, and as small pots as possible should be employed with a good, light soil. Plants now showing their buds will prove very useful during September and October. See that they are not in the slightest degree infested with aphides, as these will cause the flowers to be deformed. Other Liliums, such as the forms of *L. speciosum*, that are now flowering under natural conditions, should be kept in a cool, airy house, and any that may be somewhat later should be kept back in the open for a time. As these pass out of flower do not immediately dry the bulbs off but endeavour to retain the leaves to nourish the plant.

GREENHOUSE PLANTS.—In their native habitats, both Cape and New Holland plants receive a greater proportion of beneficial influence from the sun than they receive in this country. After potting, either keep the pots well moistened on their exterior surfaces, or shade them from the sun's rays to prevent the soil becoming dry to an unequal degree. During very hot weather it is an excellent plan to lightly syringe all greenhouse plants that are standing outside, and more especially such as have been repotted recently; this should be done as soon as the sun has left the plants. Any necessary tying and training of the shoots should be attended to before the plants are housed. There is more room to do the work in the open. Pay a close attention to the watering of all permanent plants, and see that the mass of roots is thoroughly soaked. The practice of affording just a little water, when the plants are not actually dry, and that merely to save further attention, is inadvisable; it is a lazy man's system. Keep a close watch for all insect pests. In such a season as the present one both thrips and red spider multiply very rapidly. Indian Azaleas (*Rhododendron indicum*) are liable to be attacked by both these pests, but frequent syringings on the under-surfaces of the leaves will keep them in check if done in time.

LILY OF THE VALLEY.—Retarded crowns of Lily of the Valley may be had in flower in about three weeks from the time of potting, but it is better to allow a few days more, and inure them to the full light when about half developed. After potting cover them with a light dressing of cocoa-fibre refuse, or failing that, with light sandy soil. Lily of the Valley will be found useful for decorative purposes from the end of September onwards.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PLANTING PEACH TREES.—If it is intended to plant Peach trees for forcing early in the New Year the work should not be deferred later than is absolutely necessary; the planting may be done with safety as soon as the growths show signs of ripening. The trees may be expected to crop according to their size. It often happens when a tree is shifted after the branches become bare of leaves, any fruits that may set the following season grow for a short time and then turn black in the centre and drop. This is, no doubt, due to a too recent disturbance at the root, whereas, if autumn planting is adopted, the tree has two or three months for the soil to settle about the roots before the winter arrives. Where space permits, it is a good plan to grow a few young trees of suitable varieties a season or two before they are required for planting indoors. This allows time to train the branches and for fibrous roots to develop. Peach trees, when newly planted in rich soil often develop excessive growths, unless they produce crops of fruits. The nature of the soil in which the trees are planted should depend, to a great extent, upon the natural soil of the border, which may be judged by the condition of the other trees there-

in. Perfect drainage is essential and, if this is deficient, it must be provided. Nothing is better for planting the trees in than good loam, with either crushed bones or bone-meal, a sprinkling of wood ash, and, according to the nature of the loam, sufficient lime rubble, or mortar rubbish, to ensure the soil being porous. Remove any damaged roots and those that do not possess fibres, and always cut them from the underside with a sharp knife. Plant the trees firmly, and allow for the soil shrinking. Give a thorough watering, and apply a mulch on the surface, near to, but not quite touching, the stem. Do not tie the branches, save a few in loose ties to keep the tree in position. Admit an abundance of fresh air, and, in the event of hot weather, shade the glass.

CUCUMBERS.—Plants of Cucumber in bearing will require top-dressing with a little rich material to stimulate growth, as the rootlets appear on the surface. Endeavour to keep the foliage clean by syringing the plants with clear water as frequently as the weather permits. Growing plants of later batches will require manurial assistance, such as diluted liquid manure. The best results will be obtained at this season by the use of fire heat in dull weather and at night time. Seeds should shortly be sown in considerable heat to raise a later batch of plants. Place the seedlings near the glass, and when they develop the first rough leaves and are ready for potting, shift them into pots 5 or 6 inches in diameter. Afford water carefully for a time, but damp the under-surfaces of the leaves, also the surroundings frequently. Lockie's Perfection is one of the best varieties for late cropping, and Syon House, when obtained true, is also to be recommended. The latter is an excellent variety for planting at the end of the year, and though the fruits are short, they develop a good shape, and the plant is a free cropper.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

FRUIT-TREE BORDERS.—The soil of borders in which fruit-trees are planted should, in all situations, possess a certain degree of adhesiveness, but not such as to prevent openness of texture. Adhesiveness is necessary for the soil to retain moisture, whilst the advantages of an open texture are obvious. In a soil possessing these qualities the root fibres will increase abundantly, and the more they increase in number the better will the tree flourish. Such a soil, under hot, dry conditions, will readily absorb and retain a sufficiency of moisture, and is less liable to cake and crack on the top, whilst under colder, wetter conditions it would be so porous as not to be too retentive of moisture, at the same time admitting a certain degree of warmth from the atmosphere, which is of great importance in promoting the healthiness of the tree. A cold, wet situation, where stagnant moisture is retained about the roots, is certain, sooner or later, to favour disease. It is always better to have a soil too light, rather than too wet, for when too adhesive and the roots have extended in the border, a remedy cannot well be applied without doing considerable damage to them. But the defects of a light soil may be partly remedied in affording the tree a greater quantity of food by surface-dressings, or manure water. Where the natural soil is found to possess too much clay, coarse sand, road grit, or burnt vegetable refuse may be mixed with it, and the whole well turned over previous to planting the trees. If the soil is too light, it may be improved and consolidated by the addition of one of the lighter sorts of clay, and well-decayed cow manure. Where the soil is a very strong loam, proper drainage must be provided unless the substratum is naturally porous. The use of stones or loose gravel for forming the under-stratum is far preferable, in the majority of instances, to stone slabs or concrete; the latter prevents the water steadily settling down below the soil of which the border is composed, consequently the soil nearest the concrete is frequently in a sour condition, whilst the stones or gravel allow an undue amount of moisture to filter away, whilst at the same time few, if any, of the roots of the tree will penetrate into or beyond the drainage. The soil for the border should be prepared two or three months in advance of planting. This

method of preparing fruit borders may, perhaps, be considered by some troublesome and expensive, yet it is of the utmost importance to the well-being of the trees, and the expense incurred is not nearly so great as it would be afterwards in correcting faults. The soil should always be in a suitable condition of moisture when the trees are planted, neither too wet nor too dry; a good test is to squeeze some in the hand: if it falls apart when the hand is loosened, it is too dry, and if it can be moulded stiffly, it is too moist. Besides the disadvantage experienced in working the soil when wet, it does not allow ramming to be done, as that would cause caking; the disadvantages of a dry soil are obvious. Do not mix fresh manure about the roots of the trees; this is best applied as a mulch. It is unwise to fasten the branches in position until the tree has settled in its place. The Apple requires a strong loam, the Pear a rather light soil, and the Plum, Cherry, Peach, Nectarine, and Apricot an even lighter soil. Damsons and Prunes will thrive in heavy, cold soils, in which it is almost impossible to grow other kinds of fruit successfully.

THE FRENCH GARDEN.

By PAUL AQUATIAS.

MELONS.—Where Cauliflowers have not been planted as an intercrop amongst Melons the beds may now be cleared. The soil of old Melon beds is very rich, and is generally used for open air crops the following season. For this purpose, the manure of the first trench is carried away, and the path between the two first beds dug when levelling the first bed. The fine soil from the second bed is spread evenly on the first, and the manure from it is placed in a ridge on the first bed, and so on till all the manure is taken out from all the trenches. When this is done the manure is spread evenly over the ground, which is then dug in the usual manner.

CUCUMBERS.—Cucumber plants should be watered very carefully, and the lights closed at night to favour the production of fruits as long in the season as possible. Very little water is needed as the roots will now find plenty of moisture in the manure.

OPEN AIR CROPS.—An abundant supply of water must be given to Cauliflowers, Celery and Carrots as these plants are growing fast. The earliest batches of Celery grown in the old manure beds may be bleached by spreading mats over them. If the plants have been grown very closely, covering the outside rows will suffice. The drought has delayed the planting of Batavian Green Endive. The germination of Spinach has been very slow from the same cause. In many cases Lamb's Lettuce has not yet been sown. It will, therefore, be necessary to take advantage of the first showers to attend to this operation. The Onion plants are now appearing through the soil, and waterings must be done, but not in excess, as too much moisture is very harmful at this stage.

WINTER CROPS.—Seeds of Lettuces should be sown very thinly, in frames or under cloches, to furnish plants for cutting in November. The glass needs to be shaded very carefully during the time the seeds are germinating; a little ventilation should be afforded as soon as the cotyledons appear. Little Black Gott is the best variety for this sowing. Where cloches are at liberty in October a few Cos Lettuces, Grey of Paris, may be sown in the same way. We intend to cultivate our plants in frames this season as the cloches will be needed for other crops before the bulk of the Lettuces are ready for marketing late in November.

MUSHROOMS.—To obtain good results with this crop, long strawy horse-manure should be used for the beds, placing it in heaps 5 feet high, and 6 feet to 7 feet wide. Short manure is spread evenly on the heap as the work proceeds. The mass is watered thoroughly to promote fermentation, and it is trodden firmly afterwards. After six or seven days the heap is turned again, the dry manure from the outside being placed in the centre and, if necessary, more water is applied. The height is maintained by making the heap narrower. The spawn should be placed in a damp spot where the temperature does not exceed 55°, for a few days previous to the spawning of the beds.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR SEPTEMBER.

- SATURDAY, SEPTEMBER 2—
Border Hort. Soc. Sh. at Coldstream. Soc. Française d'Hort. de Londres meet.
- TUESDAY, SEPTEMBER 5—Scottish Hort. Assoc. meet.
- WEDNESDAY, SEPTEMBER 6—
Glasgow and West of Scotland Fl. Sh. (3 days).
- THURSDAY, SEPTEMBER 7—
Nat. Dahlia Soc. Exh. at Crystal Palace (3 days).
- MONDAY, SEPTEMBER 11—
United Hort. Benefit & Prov. Soc. Com. meet.
- TUESDAY, SEPTEMBER 12—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Thomas Smith, on "The Small Holdings Movement.")
- WEDNESDAY, SEPTEMBER 13—
Roy. Caledonian Hort. Soc. Sh. in Waverley Market, Edinburgh (3 days) Dickson & Robinson's Vegetable Competitions at Manchester.
- THURSDAY, SEPTEMBER 14—
Nat. Rose Soc. Autumn Sh. at R.H.S. Hall, Westminster. Soc. Nationale d'Hort. de France (Paris) Exh.
- SATURDAY, SEPTEMBER 16—
Faisley Florist Soc. Chrys. Sh. Elstree and Boreham Wood Fl. Sh.
- MONDAY, SEPTEMBER 18—
International Conference on Genetics at Paris (6 days). Nat. Chrys. Soc. Executive Com. meet.
- WEDNESDAY, SEPTEMBER 20—
Nat. Dahlia Soc. Exh. at Royal Botanic Gardens, Regent's Park (3 days).
- TUESDAY, SEPTEMBER 26—
Roy. Hort. Soc. Coms. meet. Vegetable Competition (Lecture at 3 p.m. by Mr. H. Senn, on "Salads.")
- WEDNESDAY, SEPTEMBER 27—
Watford Fl. Sh. Irish Gard. Assoc. and Benev. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—59°1°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 30 (6 p.m.): Max. 73°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 31 (10 A.M.): Bar. 30°3'; Temp. 66°; Weather—Sunshine.

PROVINCES.—Wednesday, August 30: Max 63° Yorkshire; Min. 58° Scotland N.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs in all varieties, at 67 and 68, Cheapside, E.C., by Messrs. Protheroe and Morris, at 10.30.
- MONDAY, WEDNESDAY, AND THURSDAY—
Dutch Bulbs in Large and Small Lots, at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C., at 12.30. (Established 1760.)
- FRIDAY—
Imported Oncidiums, Sophronitis, Cattleyas, &c., also established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 12.45.

The Brambles of the World.*

Although this embracing designation appears in the title of the work, the author emphasises the fact that he is not in the position to offer a complete monograph of the genus *Rubus*. He preferred giving the amount of information he already possessed to waiting for finality, and botanists will be grateful to him for this decision. Dr. Focke's view is that a knowledge of the distinct species-types of the whole genus is of the first importance, leaving the further subdivision to be worked out with the great-

est reserve and caution. This statement explains in the fewest words possible the character and, it may be added, the quality of his work. It would be presumptuous to give an opinion of the value of his classification without submitting it to a practical test. At the same time we are impressed with the idea that Dr. Focke's book will at once be accepted as authoritative. The descriptions and definitions are brief, clear and devoid of useless and tiring repetitions. References are limited to records concerning which there is no doubt that the same species, with the same limitations, was under observation. The descriptive part is in Latin and the rest in German. The author's primary divisions, using his own terminology, are sub-genera, of which there are 12, namely: *Chamæmorus*, *Dalibarda*, *Chamæbatus*, *Comaropsis*, *Cylactis*, *Orobatus*, *Dalibardastrum*, *Malachobatus*, *Anoplobatus*, *Idæobatus*, *Lampobatus*, and *Eubatus*. With slight modifications this is the same classification proposed by the author in 1874 and improved in 1888. As thus constituted, *Rubus* contains no elements not generally accepted, and it is a well-defined genus, though exhibiting great variety in habit, foliage, inflorescence and fruit.

R. Gunnianus, a native of the hills of Tasmania, belonging to the sub-genus *Dalibarda*, is described as the smallest of all *Rubi*; that is in stature. It creeps on the ground, forming large patches, and bears edible fruits, in flavour resembling those of *Vaccinium Oxycoccos*. *Rubus arbor*, from Central China, is the only species described as a tree, but its dimensions are not given. The fruit of *Rubi* is composed of five, or sometimes fewer, carpels; but they are usually numerous, and sometimes as many as a thousand may be found in a fruit. The sub-genera are of very unequal size, the first seven numbering collectively only 45 species. *Chamæmorus* is restricted to one species, which is circumpolar in the north, including Britain. *Comaropsis* comprises only two species restricted to extra-tropical S. America. *Orobatus* is a group of about a dozen species confined to the Andes. *Anoplobatus* consists of half-a-dozen species, including the familiar *R. odoratus*, *R. nutkanus* and *R. deliciosus*. They are unarmed and mostly bear edible fruits, though of *R. deliciosus* it is said "fructus atropurpurei, ursis potius quam hominibus grati"—agreeable to bears rather than men! *Malachobatus* and *Idæobatus* number upwards of 100 species each; the former inhabiting tropical and sub-tropical regions in Asia; the latter widely dispersed. Dr. Focke gives no statistics of distribution, but the greatest concentration of species seems to be in Eastern Asia, and especially in Central and Western China. In 1887 there were catalogued 40 species of *Rubus*, native of China, and this number had been increased to 100 in 1905. These species are not critical species, as exemplified by our native Brambles, but mostly very distinct from each other, exhibiting a range of diversity not developed in any other part of the world, and representing, if we in-

clude Japan, 10 out of 12 of Focke's sub-genera; the missing ones being the South American *Comaropsis* and *Orobatus*.

The third part of Focke's Monograph is to be devoted to the elucidation of the sub-genus *Eubatus* or Tree Brambles, including our native Blackberries, of which botanists have made so many species. Dr. Focke commenced his studies on this group more than half a century ago, and he has published a number of forerunners to his looked-for final revision that lead us to expect a more philosophical treatment of *Eubatus* than has yet appeared. It will be news to many that this sub-genus is most richly developed in South America, and that it is wanting in almost all other countries except North Africa. A single branch, says Focke, of *Eubatus*, the *Moriferæ*, reached Europe, where it has split up into numberless small species.

SUPPLEMENTARY ILLUSTRATION.—We reproduce a sketch, by Mr. WORTHINGTON SMITH, of the fine inflorescence of *Crinum Johnstonii*, shown by Sir TREVOR LAWRENCE at the meeting of the Royal Horticultural Society on June 6 last, when the plant was recommended an Award of Merit by the Floral Committee. The spike bore about 20 expanded flowers and a number of buds, and the peduncle was stout, solid and about 2 feet long. The species is a native of British Central Africa, where it was first found on Mount Zomba by the late Mr. McCLOUNIE, of the forest department in that colony, who forwarded a number of bulbs to Kew in 1899. Plants flowered freely in a warm greenhouse, and a figure was published in the *Botanical Magazine*, t. 7812 (1902), with a description by Mr. BAKER, who named it in compliment to Sir HENRY H. JOHNSTON, who was Commissioner and Consul-General for British Central Africa. *C. Johnstonii* is closely allied to *C. longifolium* (capense), one of the most widely distributed of African *Crinums*. As a garden plant it might easily be mistaken for the white form of *C. Powellii*, which is a hybrid between *C. longifolium* and *C. Mooreanum*, and is unquestionably the best of all garden *Crinums*, as it is hardy in the warmer parts of the British Islands, growing and flowering very freely in summer in a sunny border. The flower-head of *C. Johnstonii* shown by Sir TREVOR LAWRENCE had been cut from a plant established in a warm border at Burford Lodge. It is, therefore, likely that this species is hardier than it was at first supposed to be, especially as Mount Zomba is more than 5,000 feet high. The flowers are fragrant, about 8 inches long, with a narrow green tube and a bell-shaped limb, the segments being ovate, 1½ inch wide, white tinged with red on the keel and the apiculate tip; the filaments are white, the anthers brown, and the style red.

THE CABBAGE BUTTERFLY.—A lady resident at Godalming, Surrey, recently offered prizes for the largest number of white Cabbage Butterflies (*Pieris brassicæ*) captured in the district. The butterflies were exhibited at the show of the Farncombe Allotment Society held on Saturday, August 26, and numbered no fewer than 5,400; a boy won the 1st prize with a catch of 2,974, a girl followed with 1,726, and a second boy came 3rd with 700. The largest collection included not a single specimen other than the species named. As the prizes were offered but a few weeks previous to the exhibition, the chief prize winner must have exerted extraordinary energies.

* *Species Ruborum Monographia generis Rubi Prodrömus*. Autore Wilhelm Olbers Focke. Pars. I., 1910. Pars. II., 1911. (Bibliotheca Botanica, Heft 72.) Quarto, pp. 223, tt. 87. (Stuttgart: Schweizerbart.)

CRINUM JOHNSTONII (BRITISH CENTRAL AFRICA).

THE SPECIMEN ILLUSTRATED WAS CULTIVATED IN A BORDER IN SIR TREVOR LAWRENCE'S GARDEN AT BURFORD, SURREY.

ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION: EXHIBITS OF SUNDRIES.—Plans have been prepared, and arrangements are now organised for exhibitors of horticultural sundries to negotiate for spaces at the Royal International Horticultural Exhibition to be held in the Chelsea Hospital Gardens from May 22 to 30, 1912. By the term horticultural sundries is to be understood all subjects relating to a garden other than plants, flowers, trees, shrubs, seeds, and such like. Garden houses, garden furniture and ornaments, glasshouses, heating apparatus, implements, appliances, tools, manures, insecticides, and garden recreations and games will be considered as sundries. There will be spaces in the open air and under canvas. Plans, particulars, and application forms can be had from Mr. ARTHUR J. GASKELL, Royal Horticultural Hall, Vincent Square, Westminster, London, S.W., to whom all communications respecting sundries should be addressed for the present. As the amount of space available for sundries is limited, those desiring the better positions are advised to write for particulars before September 30, on which date the information will be despatched to all simultaneously. A special jury will inspect the exhibits of sundries, and recommend awards.

INTERNATIONAL CONFERENCE ON GENETICS AT PARIS.—The arrangements for the fourth international conference on genetics are now complete, and we enumerate some of the more important fixtures. The proceedings will open on Monday, 18th inst., at 9.30 a.m., with a formal reception of the members at the office of the Société Nationale d'Horticulture de France (84, Rue de Grenelle). M. VIGER, the President of the Society and also of the committee responsible for the arrangements of the genetic conference, will deliver an address of welcome. In the evening the members will be entertained at a cinematograph display of botanical subjects prepared by Mons. GAUMONT. On Tuesday, at half-past nine, business will begin in earnest with the first sitting of the conference. The meeting will adjourn for lunch, but will resume at 2.30. On Wednesday the conference proceedings will commence at 9.30, and the afternoon will be devoted to visiting the Pasteur Institute, which has done, and still does, so much in the interests of the science of bacteriology. This visit will be followed by an excursion on the next day to the Pasteur Institute at Garches, and an inspection of the Vilmorin experimental nurseries at Verrières-le-Buisson. On Friday and Saturday the conference will meet at 9.30 a.m. and 2.30 p.m. respectively. On Saturday morning a visit will be made to the Natural History Museum. A fitting termination to the activities of the week will take the form of a subscription dinner, to be held on the Saturday evening at eight o'clock.

SMALL HOLDERS' EXHIBITION.—A show of vegetables, hardy fruits, and other produce, open only to small holders, allotment holders, and cottage gardeners, was held on the 29th, 30th and 31st ult., in the Small Holdings and Country Life section of the Festival of Empire at the Crystal Palace, Sydenham. The schedule embraced 79 classes, with separate divisions for small holders, allotment holders, cottage gardeners, and small-holder clubs. On the whole the competition was poor, 20 of the classes containing no entries and many others only one or two. In organising the show, the greatest difficulty was experienced in reaching and informing a hard-working and widely-scattered class, rather indifferent to competitive exhibitions and curiously averse to co-operation. The quality of the produce exhibited was in many individual exhibits excellent, but the average was weak, and Peas, Cauliflowers,

Turnips, and Salads were unrepresented. The best contested class was that for the largest Potato, in which 23 tubers were staged, the winning exhibit, a tuber weighing 2 lbs. 1 oz., being sent by Mr. G. DUKE, Tapton, Sussex. The Silver Championship Cup offered to the competitor securing the greatest number of points at the show was won by Mr. T. KING, Chippenham, who won 11 1st and five 2nd prizes. The gold medal offered to the competitor securing the second highest number of points was won by Mr. G. SCOURFIELD, Neath, Glamorganshire.

NATIONAL DAHLIA SOCIETY.—The early exhibition of the National Dahlia Society will be held on the 7th and 8th inst. at the Crystal Palace, Sydenham. The exhibits will be arranged in the centre transept. The Dean Memorial Medal will be awarded for the best exhibits of Cactus Dahlias in Classes 17 and 26 of the schedule, which may be obtained from the secretary, Mr. E. F. HAWES, Royal Botanic Gardens, Regent's Park.

"THE HORTICULTURAL DIRECTORY."—The editor of this gardening annual solicits the aid of our columns in obtaining information respecting the changes of gardeners' or nurserymen's addresses that may have occurred since last December. Notice of such changes may be sent to him at 12, Mitre Court Chambers, Fleet Street, London, E.C.

"THE BOTANICAL MAGAZINE."—The issue for August contains illustrations and descriptions of the following plants:—

CLUSIA GRANDIFLORA, tab. 8387.—The species of *Clusia* are epiphytic shrubs inhabiting tropical America and the West Indies. *C. grandiflora* is a native of Guiana, and the specimen figured in the *Botanical Magazine* flowered in the Cambridge Botanic Garden, the plant having been received 23 years ago from the gardens of the Royal Botanic Society at Regent's Park. The specimen is a pot-plant about 9 feet high, and has six branches fully furnished with ovate or elliptic-ovate leaves, some of them measuring 18 inches long and 7½ inches across. It is stated that its cultivation among other tropical plants at Cambridge has not given rise to any great difficulty. The plant requires much moisture, both in the atmosphere and at the root. Its propagation may be effected by cuttings, but a period of at least six months is required to establish a specimen. The plant is dioecious, the large, white flowers with faintly rose-coloured margins being produced in terminal cymes.

TORENIA ATROPURPUREA, tab. 8388.—This species of *Torenia* is described as being remarkable for the dark purple colour of the corolla, and the unusual length of the corolla tube. It is a native of the Island of Sumatra and of the central portion of the Malay Peninsula. In Perak and Selangor, Mr. RIDLEY found it growing in considerable clumps on clay banks. The figure has been prepared from a plant which was presented to Kew in 1909 by the late Colonel BEDDOME, who cultivated an interesting collection of uncommon stove and greenhouse plants at Sispara, West Hill, Putney. Colonel BEDDOME obtained the plant originally from Sir FRANK CRISP, to whose collection at Friar Park, Henley, it had come as *T. rubens* from an Erfurt nursery. The plant was formally included in *T. asiatica*, by reason of the calyx being faintly keeled only, and not winged, and there is some excuse also for its inclusion with *T. rubens*; but the colour of the corolla is very different from *T. rubens*, and there appears ample justification for Mr. RIDLEY making the plant a new species. *T. atropurpurea* appears to be a very decorative plant, needing a warm, moist house, where it may be grown either in a basket or as undergrowth where there are borders of soil. Grown in

the latter conditions the plants spread readily over the surface of the soil and flower freely. In its coloration and in the form of its corolla the flower is a marked contrast to *T. Fournieri*, which is commonly met with in gardens.

LANDOLPHIA PETERSIANA, tab. 8389.—This species is widely spread throughout East Africa, and it has been given many different names from time to time owing to its extreme variability. The species is usually known in East Africa as the "Mpira," and it was first added to the Kew collection in 1879, when seeds were sent from Dr. (now Sir J.) KIRK from Zanzibar. Another plant was received from Kew from the Jardin des Plantes, Paris, in 1892, and this latter plant has been cultivated in the Tropical Economic House, where it flowered for the first time in July, 1910. The flowers are pure white and sweetly scented. The fruit varies from globose to Pear-shaped and is edible. The latex yields a rubber of inferior quality.

MORMODES REVOLUTUM, tab. 8390.—This species from Peru flowered for the first time in this country in July, 1909, in the nursery of Messrs. SANDER & SONS, St. Albans. Another plant which has thriven well in an intermediate temperature, such as is suitable for *Catasetum*, flowered at Kew in January, 1910. *M. revolutum* is allied to the Colombian *M. speciosum*, Lindl. Another species of similar habit is the recently-described *M. Wolteriana*, Kränzl. The flowers of *M. revolutum* are cinnabar-red with a yellow lip, and they appear to be very ornamental.

MUTISIA CLEMATIS, tab. 8391.—This South American member of the N.O. Compositæ was figured in *Gardeners' Chronicle*, 1889, vol. v., p. 501, fig. 88. It is a decorative climbing plant, which thrives well in a greenhouse, and produces flowers which have very showy ray-florets.

"THE GENUS ROSA."—Mr. MURRAY informs us that he is the sole publisher of this work, not Messrs. HENRY SOTHERAN & Co., as stated on p. 151. Copies of the parts, or of the whole work when it is ready, may be obtained through Messrs. SOTHERAN and other booksellers.

PERSIMMONS.—Under this heading the *Kew Bulletin*, No. 5, 1911, pp. 234-245, contains an article by W. BOTTING HEMSLEY dealing with the Kaki, *Diospyros Kaki*, and some of its allies. Upwards of 40 years ago there was considerable discussion in the horticultural Press (see *Gardeners' Chronicle*, 1870, pp. 39 and 312) concerning the identity and synonymy of the species of *Diospyros* cultivated in France, and the chief disputants were J. DECAISNE and E. A. CARRIÈRE. Without entering into the whole question, it may be stated that CARRIÈRE, who held, for those days, quite heterodox views of species, described one of the cultivated forms under the name of *Diospyros Roxburghii*, which he maintained was less hardy than *D. Kaki*, and probably the same species as *D. Kaki* of ROXBURGH'S *Flora indica*, vol. ii., p. 527. DECAISNE, on the other hand, declared that CARRIÈRE's plant was the true *D. Kaki*, and that CARRIÈRE had wrought confusion generally in the cultivated species. Mr. HEMSLEY claims to have elucidated the point in favour of CARRIÈRE. *D. Roxburghii* is a native of Eastern India and Western China, and *D. Kaki* of Eastern China and Japan, broadly stated, but the subject is not yet exhausted. The only herbarium specimen seen of the true *D. Kaki* from India is from the Rajah's garden at Panukka, Bhotan, collected by W. GRIFFITHS. A copious bibliography of books and papers on the subject includes selection of varieties, cultivation, and preparation and preservation of the fruit.

A PROLIFIC PEAR TREE.—Mr. HENRY STEVENS, the well-known auctioneer of King Street, Covent Garden, has brought to our notice a remarkable exception to the general scarcity of Pears this season. A tree of the variety Williams's Bon Chrétien, planted about 40 years ago at Ashford, Middlesex, has fruits hanging in dense clusters. One small branch, not more than 2 feet in length, brought by Mr. STEVENS, had 12 large fruits that turned the scale at 4 lbs., and the tree has numerous other branches similarly well fruited.

GENERAL ALBUM OF CRYPTOGRAMS.—Students of the lower plant-organisms will find in the *Album Général des Cryptogams*,* the first part of which has just appeared, an invaluable collection of drawings. The album, which is the work of Dr. HENRI COUPIN, is to be issued in a series of parts, each of which may be purchased separately. The present part contains 15 plates, illustrating the remarkable forms which are met with among the lower groups of the Algæ, namely, the Chrysomonadinaceæ and the Dinoflagellatæ.

PUBLICATIONS RECEIVED.—*Michigan Agricultural College, Experiment Station.* Bulletin No. 264: Dairy Husbandry Department, Second Report of Grade Dairy Herd, by A. C. Anderson; Technical Bulletin No. 7: Organic Nitrogenous Compounds in Peat Soils, 11, by C. S. Robinson. (East Lansing, Michigan, U.S.A.)—*Illustrations of New South Wales Plants*, by J. H. Maiden. Part III. (Sydney: William Applegate Gullick, Government Printer.) Price 3s. per part.—*How to Cook Vegetables*, by C. Hermann Senn. (London: The Food and Cookery Publishing Agency.) Price 2s.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 64-70.)

(Concluded from page 147.)

8, ENGLAND, S.W.

DEVONSHIRE.—The crops of stone fruits are not good for late frosts and cold north winds ruined many of the blossoms. The exceptional hot and dry weather during May and the greater part of July was not conducive to the swelling of the fruits, and many Apples, Pears, and Plums dropped from the trees. Peach trees present a poor and crippled appearance, due largely to the curl or blister disease. Small fruits have been abundant and good, although rains during the third week in June partly spoiled the Strawberry crop. *James Mayne, Bickton Gardens, Budleigh Salterton.*

The fruit crops generally are good, small fruits being of excellent quality. Frosts and cold north-east winds prevailed whilst Peach and Apricot trees were in bloom, and destroyed many of the embryo fruits. A severe hail-storm early in June disfigured many Apples and Pears. The soil here is somewhat heavy, with a clay subsoil. *A. Dunkley, Stokelake House Gardens, Chudleigh.*

The fruit crops are above the average, with the exception of Peaches and Nectarines, which were damaged by the severe frosts and leaf-blister disease. Small fruits, including Strawberries, Gooseberries, Raspberries, and Currants, are good and clean, but Pears are scarce. The Apple crop is an exceptionally heavy one. The soil here is very light, resting on the Devonshire waterstone. *Geo. Baker, Membland, Newton Ferrers, Plymouth.*

GLOUCESTERSHIRE.—In the early spring the fruit crops were very promising, but long continued easterly winds with frost, followed by drought, spoiled the prospects. At the time of writing there has been no rain in this neighbourhood to any extent for over two months. *William Keen, The Gardens, Bowden Hall.*

The Apple crop promises to be satisfactory, and we had a very large crop of Gooseberries, but Pears are scarce. Cherry trees

blossomed freely, and apparently the fruits set well, but numbers fell later owing, I believe, to drought. Peaches and Nectarines are failures, owing to frost and cold weather generally whilst the trees were in bloom. Strawberries gave a remarkably good crop. We gathered some exceptionally fine fruits of Laxton's Latest, nine of which turned the scale at a pound. *John Banting, Tortworth Gardens, Falfield.*

The hardy fruit crops are very satisfactory, although blight made its appearance early on Cherry and Plum trees. Syringings with insecticides and rains from June 20 to 26 corrected this, and the trees are now very clean and healthy. Cherry trees have given a good crop, and Plums are satisfactory. Apple trees are well laden with fruits which promise to be of good quality. Apricots, Nectarines, and Peaches are all poor crops, and Pears also are an under crop, but the fruits are good in quality. Bush fruits, including Currants, Gooseberries, and Raspberries were all very plentiful, and of much superior flavour to last year. Strawberries have been abundant and good in quality. Our soil is a loam resting on limestone rocks, and fruit trees require mulching and copious waterings during dry weather. *F. C. Walton, Stanley Park Gardens, Stroud.*

Peach, Apricot, and Nectarine trees all flowered profusely, but the blossoms were damaged by late frosts. The crops of Apples and Pears, both dessert and culinary varieties, are good. Bush fruits were plentiful and good, and although Strawberries were late these also were very satisfactory. I find that Givon's Late Prolific and The Bedford are the two best varieties for travelling a distance. Our soil is of a light nature with a stiff, clayey subsoil. *Arthur Chapman, Westonbirt, Tetbury.*

Gooseberries, Currants, and Raspberries were all record crops, and the fruits were clean. Strawberries were small in size, notwithstanding the plants were watered freely. Aphis has been very troublesome this season. The soil here is a medium loam resting on sand. *H. Berry, Higham Court Gardens, Gloucester.*

HEREFORDSHIRE.—Apple trees blossomed freely, and some varieties set abundant crops, but the fruits are dropping freely, owing to the drought. Cherries were very fine, being clean and good in size and flavour. Morello Cherries were not so plentiful or so large as last year. Plums are scarce. Red Currants are a heavy crop; white and black Currants were good, but somewhat scarce in places. Gooseberries were fine, and the bushes were not infested with caterpillars this year; they were exceedingly late in starting into growth. The want of rain spoiled the late Strawberries, and the fruits ripened 13 days earlier than usual. On the whole, the berries were of good quality. Our soil is a cold clay, with a clay subsoil. *Thos. Watkins, Newport Hall Gardens, Eardisley, R.S.O.*

Owing to favourable weather during the blossoming period the trees set very large crops of fruit, but the continued dry weather caused many Apples, Pears, and Plums to drop. Notwithstanding this, there will be good average crops of clean, healthy fruits of these kinds. Strawberries were a heavy crop, the berries being exceptionally good. Small fruits, and especially Raspberries, were all heavy crops. The soil here is of a sandy nature overlying the red sandstone formation. *Thos. Spencer, Goodrich Court Gardens, Ross.*

Bush trees of Apples are heavily cropped, notwithstanding that many trees during the end of June cast numbers of their fruits. Amongst the best cropped varieties are Warner's King, Schoolmaster, Sandringham, Lane's Prince Albert, Bismarck, Seaton House, Hornead Pearmain, Bramley's Seedling, Blenheim Pippin, Belle de Pontoise, Grenadier, Duchess of Oldenburgh, Cox's Orange Pippin, Ribston Pippin, Worcester Pippin, Sturmer Pippin, Lord Hindlip, Rival, Allington Pippin, King's Acre Pippin, and Braddick's Nonpareil. Pear and Plum trees blossomed abundantly, but the flowers lacked vigour, and but few set perfectly. Bush fruits were fairly good, with the exception of Black Currants. Strawberries ripened rather early. Our soil is cold and heavy, and some varieties of Apples are very subject to canker in this district. *Thos. Coomber, The Hendre Gardens, Monmouth.*

All fruit trees, including Apples, Pears, Plums, and Cherries produced a remarkable wealth of blossom, but, unfortunately, very cold winds, followed by long continued drought, had a detrimental effect on the flowers. Trees of Apple, Plum, and Cherry in particular have suffered severely from attacks of aphis, causing much fruit to fall prematurely, and also hindering the growth. Where sprayings have been practised consistently for the destruction of biting and sucking insects, the crops of Apples, Pears, and Plums are much better than where spraying has been neglected. It is also very noticeable that Apples and Pears are much cleaner than usual, and there is a remarkable absence of scab on the fruits as compared with other seasons. The soil in Herefordshire is, generally speaking, a heavy loam with red sandstone and gravel subsoil, and, therefore, admirably adapted to fruit culture. *King's Acre Nurseries, Ltd., Hereford.*

SOMERSETSHIRE.—Fruit trees of all kinds flowered abundantly, but the blossom in several cases was injured by cold winds in May, followed by persistent blight. Of small fruits, Red and White Currants suffered most from these causes. Strawberries, Raspberries, and Black Currants were all good crops. Of Apples, Pears, Plums, and Cherries some trees are bearing good crops, whilst others have not a single fruit. *George Shawley, Halswell Park Gardens, Bridgwater.*

On April 11 we experienced a very cold north-east wind, accompanied by snowstorms; at 5 p.m. 6° frost were registered, with the result that the crops of Peaches and Nectarines out-of-doors are almost failures. All fruit trees showed a great wealth of blossom, but the crops are deficient. Pear trees in many cases show a yellowness in the foliage and we have been recommended to apply a solution of sulphate of iron. Insect pests have been very troublesome, including the Pear slug-worm, for which we find lime-water made from acetylene-gas refuse the best remedy. *G. H. Head, Kingsdon Manor Gardens, Taunton.*

WORCESTERSHIRE.—Except in one or two instances the fruit crops are good, considering the prolonged drought and a "blizzard" in April. The blizzard was responsible for the failure of the Peach crop, notwithstanding the trees were protected with three thicknesses of netting, the best protective material at my command. Apples are healthy, and the crop of these fruits is a good one. The trees were sprayed with lime and salt wash for the destruction of the Apple Psylla. I recommend this specific to all fruit-growers. "Medela" prevents blister on Peach trees, and is also to be recommended. Of small fruits, Black Currants are the worst crop. These were also affected by the cold weather in April. Spraying with Quassia Extract cleared the bushes of aphis. *A. Young, Witley Court Gardens, Worcester.*

The Apple crop is, on the whole, disappointing after such a profusion of blossom. There seemed to be a deficiency of potent pollen, resulting in the wholesale dropping of the embryo fruits. This, I believe, was mainly due to the cold, sunless summer of 1910. Although spraying was practised thoroughly in the spring, insects of all kinds, and especially aphis, were never more plentiful or persistent in their attacks, being favoured by climatic conditions. We used various insecticides, but found nothing better than cold water applied with force from a hose, and, whenever possible, on succeeding days. Pears were also greatly thinned by the ravages of the Pear midge. Stone and wall fruits generally are very unsatisfactory after a most promising appearance at the time of blossoming. Strawberries and other small fruits were abundant but soon over, the crops of later varieties being almost failures owing to the drought and heat. *W. Crump, Madresfield Court Gardens, Malvern.*

WALES.

DENBIGHSHIRE.—Fruit trees generally blossomed well, but many of the fruits fell, especially Peaches and Nectarines. Our soil is of a light nature and the subsoil is sandy. *J. Martin, Bryn Estyn Gardens, Wrexham.*

The fruit crops are not nearly so good as we expected, considering the wealth of

* By H. Coupin. Published by E. Orliac, Paris. Price per post 2 francs 50.

blossom on all the trees. Some varieties of Apples are carrying good crops, but others are bare of fruits; some old, unpruned trees in cottage gardens are laden. The crops of Peaches, Nectarines, and Apricots are complete failures, owing, no doubt, to frosts when the trees were in flower. Plums and Cherries failed to stone and soon dropped from the trees. Small fruits are, on the whole, very good. The drought during May and part of June is the chief cause of the failures in the fruit crops. The soil in this district varies greatly; in these gardens it is a stiff clay. *J. A. Jones, Chirk Castle Gardens.*

FLINTSHIRE.—The fruit crops are not so good as they promised at one time. Many Apples dropped through the effects of the drought. Pears and Plums are poor crops and Peaches are a failure, which I attribute to cold and wet weather when the trees were in bloom. Apricots are very good, also Red Currants, and we have a very good crop of Figs. Our soil is a strong loam. *James Barnard, Mostyn Hall Gardens.*

GLAMORGANSHIRE.—The fruit crops are very disappointing, especially after the good promise in early spring. Apple trees are carrying an average crop and the fruits are very clean. Pears, Plums, and Cherries are very light crops. Peaches and Nectarines are very good; the fruits are clean and the trees are carrying liberal crops. Strawberries have yielded an excellent crop of very fine berries. All small fruits are good and plentiful. *R. Milner, Margam Gardens, Port Talbot.*

—The Apple, Pear, and Plum crops are very small, bush fruits and Strawberries were plentiful and good. Peach and Nectarine trees are looking well and quite free from blight, but the crops are under the average. Morello Cherries were good, but the crop of sweet Cherries was a failure. *C. T. Warmington, Penllergaer Gardens, Swansea.*

MERIONETHSHIRE.—The fruit trees generally are very clean. The long drought affected the Strawberry crop, and just at the ripening stage the weather was wet and sunless, causing many of the fruits to rot. Loganberries are again a heavy crop. Raspberries and Red Currants were plentiful, and there was a very large crop of Gooseberries. We experienced 5° of frost on the morning of June 15. *John S. Higgins, Rhûg Gardens, Corwen.*

PEMBROKESHIRE.—The fruit crops, with the exception of Plums, are very fair, especially in well-sheltered gardens and orchards. But this is not a good fruit-growing county, the country being exposed to westerly winds, which often prevail during the blossoming period. Notwithstanding this drawback, a great quantity of fruit might be grown if its cultivation were better understood. Those who adopt proper methods generally succeed well. *Geo. Griffin, Stebeck Park Gardens, Haverfordwest.*

—Taking the fruit crops generally, the season is a good one. Apples and Pears are average crops and the fruits promise to be of good quality. Stone fruits have seldom set more freely, and Peach and Plum trees are carrying very heavy crops; Cherries, with the exception of Morellos, were plentiful. Figs are plentiful; Gooseberries, Currants, and Raspberries were all heavy crops. Owing to dry weather, when early Strawberries were ripening, the berries were not so fine as usual; later varieties, however, were very good, Givon's Late Proific and Laxton's Latest being excellent. Our soil is a light loam, resting on slate stone; the garden slopes to the south, and hardy fruits succeed well here. *W. A. Baldwin, Clynfew Gardens, Boncath, S.O.*

RADNORSHIRE.—Fruit is, as a rule, plentiful but small, especially Apples. Trees in orchards are suffering from the effects of the prolonged drought, and many cast their fruits when the latter were a good size. Small fruits were plentiful, with the exception of Black Currants. Wall fruits of all kinds are almost total failures; the wood was not thoroughly ripened last autumn. *J. MacCormack, Maesllwch Gardens, Glasbury.*

—Taking the fruit crops all round, the prospects are very good. The district is not an

ideal one for fruit-growing, as we are so subject to frosts in late spring. Plums are the smallest crop; the prospects early in the season were very good, but the continued drought throughout May and June caused the fruit to drop. Our soil is a fairly good loam on the surface, but overlies a hungry, cold, yellow subsoil; the ground is very difficult to work in damp weather. *Wilson Palliser, Horton Manor Gardens, Horton, R.S.O.*

IRELAND.

MEATH.—Gooseberry bushes in this district have been so much affected with mildew that growers have destroyed them in most plantations. The Department of Agriculture has been trying to discover some remedy for the disease, but up to this year without success, as the bushes which have been treated with what the Department recommended and supplied to the owners are the worst attacked bushes to be found. There are Gooseberry bushes growing wild in hedgerows which have been, up to and including last year, covered with mildew, but which to-day are perfectly free from any trace of the disease, though the bushes have never been treated in any way. We had a very bad attack of mildew after the storm of 1839, and in a few years afterwards the mildew disappeared, as it is now doing after the storm of 1903. The Department of Agriculture should not destroy bushes without making compensation to the owners. *Michael McKeown, Julians-town, Drogheda.*

TYRONE.—The fruit crops are somewhat disappointing. After a fine show of blossom and an apparent good set of the fruits a very large percentage of stone fruit were cast when about the size of Peas, owing, I consider, to abnormal heat and drought at the first swelling period. Pears were affected, but to a less extent. It is remarkable that Hesse Pears have failed for the first time for upwards of 20 years. *Fred. W. Walker, Sion House Gardens, Sion Mills.*

WESTMEATH.—The fruit crops are slightly under the average; we have no absolute or even partial failure to record. Gooseberries, however, were very plentiful. Indeed, I do not remember seeing a heavier crop of these fruits. Strawberries also were good. The weather at the time the trees were in blossom was favourable, but the continued drought during May and June caused many of the fruits to drop. Apple trees blossomed profusely, but those of Pear and Plum only moderately. Our soil is a medium to heavy texture, resting on a yellow clay, and it is rather shallow in places. *Geo. Bogie, Pakenham Hall Gardens, Castlepollard.*

CORK.—The fruit crops promised well up to the time of the drought. Pears suffered much from late spring frosts. Apples have been affected by attacks of the codlin moth, numbers of the fruits having fallen from this cause prematurely. *M. Colbert, Aghern, Conna.*

—All fruits were very promising early in the season, but the crops suffered from the long-continued drought. Strawberries ripened very quickly and the season of these fruits was very short. Aphis has been very prevalent on Plum, Cherry, and Black Currant trees. Excellent results have been obtained where mulching was practised early in the season. *J. Dearnaley.*

KILDARE.—The fruit crops are very disappointing, after an abundant promise early in the season; the failure is due, more or less, to the long period of drought. The rainfall here for the past three months amounted to only 5.13 inches, and the greater part fell in small quantities, so that the moisture never reached the roots of the trees. *Fredk. Bedford, Straffan House, Co. Kildare.*

WATERFORD.—The fruit crops are only about half the average, with the exception of Strawberries, which were both numerous and good. Plums, with the exception of Victoria and Damsons, are scarce. The promise for a good fruit year was excellent at the blossom stage, and there were no late frosts; indeed, we experienced an unusually mild spring and the rainfall was small. *D. Crombie, Curraghmore.*

CHANNEL ISLANDS.

GUERNSEY.—The prospect for good fruit crops was exceedingly favourable at the commencement of the year, but the weather at the time of blossoming was adverse to the fruits setting, with the result that we have crops which are scarcely equal to the average. *C. Smith & Son, Caledonia Nursery.*

JERSEY.—The fruits crops are bad, although the prospects were promising at the beginning of the season. We experienced a severe blizzard in the month of April. Strawberries have been very good. Of small fruits, we had no Gooseberries, but Red Currants were fairly good, and Black Currants good. Pears are a very poor crop; Apples are better. Many trees of Peach and Nectarine have died. We have but few Plums. *Thomas Sharman, Imperial Nursery, St. Mark's Road, St. Heliers.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.—A protest has been raised in a portion of the horticultural press against the immoderate charges for admission to this exhibition. It is to be hoped that a full discussion will be invited in the *Gardeners' Chronicle*. The advertised prices of tickets are: first day, £2 2s., second day, £1 1s., third day, 10s. These prices are absolutely prohibitive to the general public, who are well aware that a flower show is scarcely worth visiting after the second day. To justify its grandiloquent title this show should be open on easy terms to the nation, and should provide the greatest possible delight and education to the greatest possible number. The rank and file of the Royal Horticultural Society in particular have a very just grievance in the matter. The R.H.S. Council has supported the exhibition by a subscription of £1,000 and a guarantee of £4,000. The only return for this large grant out of their funds, to the ordinary or "Guinea" Fellows—who constitute the great body of the society—is that they can enter the first day for £1 10s., the second day for 10s. 6d., and at half price the other days. Few will care to go alone; if I take one member of my family the first day the tickets will cost me £3 12s., the second day £1 11s. 6d. I do not hesitate to call these figures monstrous and extortionate. A disagreeable light has been thrown on the character and organisation of the exhibition by a published correspondence between the R.H.S. Secretary and a critic of these charges. The secretary writes that the R.H.S. "has no manner of control whatever over the company." Surely the Council of the R.H.S. before advancing a great sum out of the society's funds, was in duty bound to stipulate that the exhibition should be easily accessible to its Fellows? On the contrary, the secretary concedes that "the directors of the company are free to fix such charges as they think will, from their point of view, prove remunerative." In short, the Council has handed over this money without restrictions to what would appear to be a rich man's exclusive show, got up with a view to a cash profit. The Council, through the secretary, justifies itself by an extraordinary arithmetical fallacy, viz., that in return for this £5,000 the society has reaped £15,712 in reductions on entrance tickets. These figures are a pure illusion. By the same logic if the price of a ticket is £10, and it is offered to me for £7, I gain £3, though I can afford neither the one nor the other. My return is a minus quantity. I lose the Temple Show, which I could enter free, and am allowed to visit this international substitute on the first day—the only day on which I care to go—for £1 10s., or for £3 12s. if I take one of my family. Certainly I shall pay no such sum, and believe my position to be that of three-fourths of the Society. The charges for admission to a similar show held 45 years ago may have been high for all I know, but it is pointless to quote them at this hour, when the whole nation has turned gardener and the strength of horticulture is the man of moderate to small means. Undoubtedly an exhibition on this scale means enormous expense, but it is incredible that it cannot be carried out without such preposterous charges, which, indeed, are likely to defeat their own intention. Even the

giving of the possible profits to horticultural or other charities would not justify the exclusion from the exhibition of the ordinary gardener. The Royal Horticultural Society cannot stand aside and say it has no influence over the promoters of this exhibition. It is British horticulture incorporate as no other society is, and has an influence which cannot be ignored by any "company" if the Council will exert it. In the matter of these charges the Council has a duty towards the public and its own Fellows, which apparently has been forgotten. *G. H. Engleheart, V.M.H.*

GLADIOLI AT THE SHREWSBURY SHOW.—Seldom, if ever, have three finer stands of Gladioli been seen than those staged in the principal class for these flowers at the Shrewsbury show. The judges' task must have been no light one to decide which of the three was the finest. Many of the spikes exceeded 2 feet in length, and some of those in the 1st prize exhibit had 12 to 18 expanded flowers. Messrs. Mair & Son, of Prestwick, N.B., who were awarded the 1st prize, had magnificent spikes of Dr. Olmsted, red with pure white blotch; Gargantua, carmine; Maria Theresa, white with rosy stripes and straw-coloured blotch; Osmanli, orange-red, white blotch; and Jeanie Smith, scarlet with dark blotch on creamy ground. Mr. Adam Bryden, Innerleithen, who was placed 2nd, staged Maria Theresa, Enchantress and Prestwick Gem in grand form. Messrs. Harkness & Co., Bedale, the winners of the 3rd prize, had several spikes of Mme. P. Palmer, rose-suffused with carmine, and having a cream blotch, in the best condition, and also Patrie, rose and violet. Mr. Bryden's 1st prize group of hardy flowers was enhanced by a splendid bunch of Gladiolus Gargantua. *F.R.H.S.*

"MIMICRY" IN PLANTS.—It is perfectly true that "certain conditions of life induce in plants definite physiognomies," as stated,* but this result is universal wherever similar external conditions prevail. It is most conspicuous in plants growing in excessive drought and in aquatics. The former causes fleshy stems and leaves wherein to store water. Hence they appear in Africa and Mexico. The Euphorbias and Stapelias and others resemble the swollen Cactus, &c., while the Aloë mimics Agave. Fleshy-leaved Mesembryanthemums resemble Crassulaceous plants. Similarly, spiny processes are found wherever a greater or lesser degree of drought prevails, as in our Gorse, Needle-furze, Rest-harrow, and Sloe. Certain forests are called "Thorn" forests in hot, dry regions of the tropics. The "Holly-leaf" with spiny margin is a type of many genera. It is a matter of nutrition only, and has nothing to do with keeping cows off any more than the "Camel's Thorn," for which that animal has evolved a leathery roof to its mouth according to Petrie. Then there is the "Cupressoid" type, mimicked by Veronicas on New Zealand Alps, some even reach the degraded form of a Salicornia. The "Ericoid" form is common in S. Africa, so that genera of Thymelaceæ mimic true heaths, while *E. marifolia*, and one or two more species growing close to water, have lost it, and bear small elliptical leaves. Some Dicotyledons growing with grasses have assumed a similar form as the Stitchwort, *Lathyrus Nissolia*, &c. Further, this similarity of form under like conditions is carried down into the microscopical structures. Thus, an ordinary leaf has one layer of palisade cells, but in deserts, where the leaves are greatly reduced in size, from two to five layers are common. Moreover, the water-storage tissues which are found in all parts of plants, are marks not of "affinity" but of "adaptation." Similarly submerged plants mimic one another. Numerous Dicotyledonous genera of many different families have one or more aquatic species, of which the leaves are finely dissected, or they may take on the linear types as in *Littorella* and *Lobelia Dortmanna* mimicking a Monocotyledon. Dwarf, tufted, often moss-like forms are found in Arctic and Antarctic regions, &c. All these and many more imitative plants could be mentioned, but one and all are explained in the same way, viz., self-adaptation to the conditions of life. This was Darwin's own explanation, for he said: "There can be little doubt that the tendency to vary in the same manner has often been so strong that all the individuals of the same species have been

similarly modified without the aid of any form of selection."† The only addition necessary to be made is, that other species of other genera are often modified in precisely the same manner, because the same external conditions act in the same way upon all alike. In other words, living protoplasm is common to all, so that it responds in an identically similar way. *George Henslow.*

CEANOTHUS AS A BEDDING PLANT.—In a season of drought, when ordinary summer bedding plants have made but a poor display, even when watered freely, *Ceanothuses* have flowered splendidly. The beautiful varieties are well adapted for planting in permanent beds, but I know of no places where they are employed in this manner except Kew Gardens and Gatton Lodge. The shoots need to be pegged to the soil, and the plants cut back each winter, protecting the stools, as is done in the case of the *Fuchsia*. The best variety is *Gloire de Versailles*, the flowers being a lovely shade of greyish blue. *Ceres*, which produces fine heads of soft pink blossoms, may be placed next in order of merit; the variety *Carmen* is practically the same as *Ceres*. Among the newer varieties, *Felibre*, *Ibis Rose*, and *Albert Pittet* have pink, and *Gracieuse*, pinkish-lavender flowers. *Arnoldii* is a fine old variety with flowers of palest grey-blue colour, and very free in blooming. *Pinguet Grindon* is the darkest reddish-pink variety. Those named are amongst the hardiest varieties. The *Ceanothus* makes a fine wall plant. The deep blue flowers of *Indigo* and *Asteroides* are very beautiful. The double-white variety is very lasting. *Veitchianus*, *papillosus*, *dentatus*, and *divaricatus*, all blue or indigo-coloured varieties, flower profusely on walls in spring. *Geo. Bunyard, Maidstone.*

HOLLYHOCK DISEASE.—In reply to Mr. A. C. Bartlett (see p. 114) a damp atmosphere seems to be the most favourable for the spread of *Puccinea malvacearum*. We find that during the months of May, June, and July, and the early part of August very little of the disease is present, but towards the end of August it begins to spread with amazing rapidity until frosts set in, which checks it somewhat, but it appears again in the early part of the year and, in many cases, throughout the whole summer. During 1909 we discovered a remedy which we first used in that year. The summers of both 1909 and 1910 were wet and cold, yet our plants were not affected after they were treated with the specific, the composition of which is given below. The disease is not less virulent than formerly, but it has been checked largely by our remedy, which we have distributed far and wide. The powder should be applied early in the season and at intervals until the blooms show colour. The new growth that appears at the bottom of the plants after flowering should also be dusted. It is essential to apply the powder in the early stages of the disease (or, better still, before the disease appears); it is no use when the disease is deeply seated so as to perforate the leaf. The mixture is made up as follows:—Slake one bushel of lime and when cool add one bushel of soot, 4 lbs. flower of sulphur, and 2 ounces sulphate of copper (finely powdered). Pass the mixture through a fine sieve and dust the plants well over with it three or four times during the growing season in the morning whilst the dew is still upon them. *G. Webb, Messrs. Webb & Brand, Saffron Walden.*

THE BEST SINGLE YELLOW ROSES (see p. 123).—In reply to Mr. Correvon, I did not refer to *R. altaica*, this being a white and not a yellow Rose. A feature of *R. altaica* is its jet-black fruits, while the Rose to which I referred bears no hips. *R. pimpinellifolia lutea* is, I believe, synonymous with *R. spinosissima ochroleuca*, and is seldom met with in gardens. It is one of the most beautiful of all the single Roses, the flowers being a rich golden-yellow colour, distinct in every way from the Austrian Briar section. It is an old Scotch Rose, and one that deserves a wider recognition, but its beauty is evidently unknown to the present generation. The Rose I wish to identify is similar in every respect to this, but the flowers are larger and have much more substance in the petals, while the colour is a deeper yellow. I have no doubt that it is of hybrid origin, and

evidently belongs to the *Pimpinellifolia* section, as classified by De Candolle in 1818. *Rosa pimpinellifolia* is apparently easily crossed in a wild state, and has given several natural hybrids. Dr. Crépin, of Brussels, in his splendid book, *Rosa Hybridæ*, published at Ghent in 1894, quotes many examples; from his list it will be seen that the Pimpernel Rose may be crossed with many other kinds of Roses. The yellow Pimpernel Rose is probably derived by natural hybridisation from *R. pimpinellifolia* and *R. lutea*, and this assumption is strengthened by the hybrid being sterile to its own pollen. If atavism be a factor in the production of varieties of Roses—and I think there can be no doubt upon this point—we can, through this, recognise the parentage in this particular instance. The single yellow Rose which I have is evidently a natural hybrid between one of the Pimpernel Roses and one of the Austrian Briars. The characteristics of these two sections are united in the Rose in question, and it is sterile to its own pollen, but I cannot say yet as to whether it will yield seed to foreign pollen, or whether its pollen will fertilise other Roses. I cannot agree with Mr. Correvon in his statement that *R. berberifolia* is the best of all the yellow Roses, but I admit with him that it is probably the most curious. This Rose differs so widely from all others that at one time it was considered sufficiently distinct to warrant its being placed in a separate genus, but it is now recognised as a true Rose. Superficially its flowers are more like those of a *Helianthemum*, and its single leaf represents the terminal leaflet of an ordinary Rose leaf, there being no development of the laterals. It is, indeed, a curious shrub. With reference to Mr. Brotherton's note on page 134 regarding *R. hemisphaerica*, would he kindly say under which name John de Frangueville mentions it—*sulphurea* or *hemisphaerica*? *George M. Taylor, Mid-Lothian.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 29.—The Committees of the Royal Horticultural Society met in the Vincent Square Hall on Tuesday last, when displays of considerable interest were contributed in the various sections. There were two outstanding exhibits, first an extraordinary number of new Chinese plants exhibited by the Hon. Vicary Gibbs, and, secondly, a magnificent collection of fruit trees in pots, contributed from the Feltham nurseries of Messrs. James Veitch and Sons, Ltd.; in both these instances Gold Medals were deservedly awarded.

Turning to the novelties, there was an interesting and new bigeneric hybrid, exhibited before the ORCHID COMMITTEE by Mr. Graire, of Amiens. This plant is to be known as *Adioda St. Fuscien*, and is the result of a cross between *Ada aurantiaca* and *Cochlidia Noezliana*. Another interesting plant exhibited before the ORCHID COMMITTEE, namely, *Houlletia Wallisii*, received an Award of Merit; this we figure in the present issue. The FLORAL COMMITTEE recommended four Awards of Merit to varieties of *Dahlia*, two Awards of Merit to varieties of *Nymphaea*, and an Award of Merit respectively to a pure-white variety of *Hibiscus syriacus* and a pretty, yellowish variety of *Gladiolus*. The FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to a new Plum. Descriptions of these novelties are given below. On this occasion there was no afternoon lecture.

Floral Committee.

Present: H. B. May, Esq. (in the Chair); and Messrs. J. Green, C. T. Druery, G. Reuthe, G. Paul, J. Hudson, R. C. Notcutt, W. Bain, Chas. Dixon, H. J. Cutbush, A. Turner, W. Cutbush, Chas. E. Pearson, W. P. Thomson, E. H. Jenkins, Wm. J. James, R. Hooper Pearson, J. W. Barr, A. Kingsmill, and W. Howe.

To those unacquainted with the enormous number of new plants collected by Mr. E. H. Wilson in China, the large exhibit of trees and shrubs from this source shown at this meeting by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), would be a revelation. The collection occupied the wall space for the whole length of the hall—some 130 feet long by 10 feet wide. Not only did the group

* *Gardeners' Chronicle*, August 19, p. 135.

† *Origin*, &c., 6th edition, p. 72.

contain very many rare and interesting plants, but its skilful arrangement rendered it attractive to even the most casual visitor. At the back there were large plants of *Rubus* of various forms, some erect in growth, others with pendulous branches, and tall pillars of *Vitis*, with large leaves, were interspersed with the plants of *Rubus*. Here and there in the group were placed such handsome foliaged trees at *Catalpa vestita*, with smooth pale green leaves, more pointed in shape than those of the better-known *Catalpas*; *Hydrangea Sargentii*, which has leaves a foot long and 9 inches broad; *Ailanthus Vilmoriana* and *Rhus vermicifera*, bearing long pinnatifid leaves of rich green. The face of the collection was tastefully broken by graceful pillar-trained plants of various genera. Probably the most interesting species were the

a plant giving edible fruit, whilst *Rubus* 815 has, both here and as planted at Aldenham House, almost glaucous white branches in the way of *R. leucodermis*. Of *Sorbus*, those numbered 1015, 922, and 1255 had distinct and ornamental foliage, and will probably be welcome additions to our moderately-sized foliage trees. Of *Berberis*, the variety 1,137 appeared distinct and good.

There was also a distinct *Privet*, 1,075, in the way of *Ligustrum Delavayi*, and a very beautiful *Hypericum*, 256, which grows a moderate height, and then the flower-shoots fall over with a pendulous habit.

Of plants which showed tinted foliage, which will probably be of some value for autumn colouring, were *Acer Davidii*, *Liquidambar formosa*, and *Eurotia* 253. Amongst climbers,

named *Cephalotaxus*. But, as many new Conifers, especially of Silver Firs, were discovered by Mr. Wilson, we may confidently look forward to the future. So large and fully established were many of the specimens shown that it was astonishing to learn that the seeds from which they were raised were only sown three years and eight months ago. (Gold Medal.)

Col. Lockwood, Bishop's Hall, Romford, showed 28 standard trained plants of *Acalypha hispida* (Sanderiana) of such high quality as has probably never before been seen. The 7-foot high plants were only 10 months old, and their stout, clean stems bore large, well-balanced heads, from which depended numbers of very long tassels of bright flowers. (Silver-gilt Flora Medal.)

Messrs. CARTER PAGE & Co., London Wall, staged a most comprehensive collection of Dah-

[Photograph by John Gregory.]

FIG. 82.—GROUP OF NEW CHINESE PLANTS EXHIBITED AT THE R.H.S. MEETING ON TUESDAY LAST BY THE HON. VICARY GIBBS.

Hydrangeas, *Cotoneasters*, *Rubus*, *Sorbus* and *Berberis*. Of the *Hydrangeas*, most of the species have to be seen in flower, but a specimen of *Hydrangea Sargentii* leads us to think that it will be one of the finest of the genus. It has huge flowers, the centres of which are blue and the outsides white, with very large and furry leaves. Of the *Cotoneasters*, *C. humifusa*, a dwarf creeping evergreen, will be useful to cover rockwork, and *C. rugosa Henryi*, a strong-growing variety, has pendant shoots almost like a Weeping Willow, whilst another variety, *Cotoneaster* 1,133a, promises to make a useful variety.

Of the species and varieties of *Rubus*, *R. inominatus*, with large bunches of green fruits, looked as if it might develop into

Hedera 425, *Smilax* 661, and *Acanthopanax Henryi*, with Ivy-like berries, were interesting. *Ailanthus Vilmoriana*, a plant with foliage nearly 4 feet in length and a red mid-rib, already in commerce, will be a noble addition to our trees. *Ilex Fargesii* had long, narrow shoots, and should be valuable for hybridising *Hollies*. *Viburnum* 498 looked as if it would be a useful plant, and *Stranvaesia undulata*, although it has been exhibited before, was shown as a good specimen of the plant. There were several *Roses* which, from their foliage, appear to be distinct species, especially those numbered 1,244 and 1,098. Only two members of the Conifer family were represented, *Cupressus funebris*, still retaining its flat, glaucous, juvenile leaves, and an un-

lias. Their very long array of cut blooms was tastefully arranged and interspersed with growths of *Bulrush* (*Typha*), *Agrostis*, *Zea*, &c. Here there were *Dahlias* to suit all tastes and fancies. The popular *Cactus* blooms were shown in a variety of fine flowers; those which pleased us most were the Rev. J. W. Jamieson, lilac-rose with a deeper edge and yellow tips; *Conquest*, deep crimson-maroon; *White Lady*; *Watford Beauty*, a single deep apricot, having a brownish-red ring around the centre; *Delice*, a rose-pink flower of the decorative type, and *Princess Juliana*, a new decorative *Dahlia* with good, long stalks. (Silver-gilt Flora Medal.)

Messrs. J. CHEAL & Sons, Crawley, Sussex, also showed some choice *Dahlias*. At the back of this firm's exhibit were a few *Bamboo* stands

filled with good blooms, which added to the attractiveness of the display. Along the front were placed newer sorts in boxes, including Bridesmaid and Killarney. Another box contained splendid blooms of miniature Cactus Dahlias, known as Pompon Cactus varieties; these flowers are very useful for furnishing small vases. Of the many fine, full-sized Cactus flowers, we noted *Iolanthe* (deep coral-red), H. H. Thomas (rich crimson) and Goldcrest, Buttercup and Snowdon, whose names denote their colours. (Silver Banksian Medal.)

Selections of new Dahlias were also shown by Messrs. JAMES STREDWICK & SONS, St. Leonard's-on-Sea. The varieties Mrs. Stephens (primrose) and Turtle Dove (variable shades of pink) received Awards of Merit. Other good sorts were Coronet (deep terra-cotta), Auckland, Richard Box (good yellow), Olympic, and Golden Plover (buff and yellow).

Messrs. JAMES BOX, Lindfield, Sussex, filled a corner of the hall with a well-arranged group, chiefly composed of cut flowers of herbaceous plants. At the back there were tall stands filled with Rudbeckias, Delphiniums, Heleniums, &c., whilst large masses of *Gladiolus princeps* and G.

the best of the blue varieties, a very rare colour in *Gladiolus*. Mrs. F. Field is a large, almost papery-white flower. Royalty, a large spike with huge blooms, would make a fine show in the garden, as also would Countess of Chichester. The Sirdar has smaller flowers of a very rich colour. Prince of Orange is a good buff-coloured *Gladiolus*, and Kenneth Kelway will find many admirers of its uncommon marking. (Silver Banksian Medal.)

Messrs. JAMES VEITCH & SONS, Chelsea, had a collection of Cannas and miscellaneous plants. There were some good standard plants of blue and white *Plumbago capensis*, and at one end a well-flowered little batch of *Rhododendron javanicum-jasminiflorum* hybrids. *Hibiscus sinensis* supplied vivid colouring, and there was a batch of *Crocea latifolia* (C. saligna), a pretty greenhouse shrub, bearing pink flowers. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, Upper Edmonton, filled a large table with shrubby Veronics and Ferns. The Veronics were short, stocky plants, chiefly in 6-inch pots, and bore quantities of flowers. The best varieties were Valiere (rich blue), Pearl (rose-pink), Violette, Grandis (blue), Eveline (pink), and Admiration (blue). These

shown under numbers. Next to the Delphiniums, Messrs. PERRY arranged a collection of *Nymphæa* blooms, surrounded with appropriate plants. (Bronze Banksian Medal.)

Some enormous *Nymphæa* flowers were exhibited by LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. J. Hudson). They consisted of six varieties, Awards of Merit being made to two of them. The finest of the remaining four was N. Attraction, which resembles N. atropurpurea, except that N. Attraction is of a deeper colour, and the flowers much larger. N. Galatée is a rich Indian-yellow *Nymphæa*, with narrow petals of stellate form. N. candidissima rosea resembles N. Marliacea rosea, but is of a brighter colour. Paul Heriot is a finely-formed flower, with massive petals of an orange-red shade.

Mr. G. KOIZUMI, 35, Bessborough Gardens, London, staged a few dwarf Japanese trees, chiefly conifers.

The GUILDFORD HARDY PLANT NURSERY staged a collection of hardy cut flowers. The white Lavender was well shown, as also were *Gentiana asclepiadea alba* and *Buddleia magnifica*; the last-named bore large spikes of bloom.

Mr. G. REUTHE, Fox Hill Nursery, Keston, arranged a collection of choice Alpine and border plants; amongst them we noted the rare *Ephedra monostachya*, bearing its large, red fruits.

Messrs. WHITELEGG & PAGE, Chislehurst, Kent, staged a group of bedding *Pelargonium Salmon Paul Crampel*, a new colour, with all the merits of the type.

Mr. L. R. RUSSELL, Richmond, arranged a very large collection of exceedingly well-grown pot plants of *Celsia pyramidalis plumosa* hybrids. These were attractively set up in distinct colours, interspersed with a few well-flowered plants of *Gesnera Orange King*.

AWARDS OF MERIT.

Nymphæa "Mrs. Richmond" (see fig. 83).—This hybrid is one of the last introductions of the late M. Latour-Marliac, and in its colour one of the finest *Nymphæas* yet raised. It may be described as a glorified N. Laydekeri rosea in form and colour. The flower exhibited measured 8 inches in diameter, and it possessed wide and massive sepals and a greater number of petals. The colour is a bright, rosy pink, which deepens with age; the stamens are of a rich golden yellow. Exhibited by LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton, W. (gr. Mr. Jas. Hudson).

Nymphæa Gladstoneana.—This is the finest pure-white Water Lily yet exhibited, without a semblance of pink upon the sepals, which are tinged with green, thus adding to its beauty. It is a bold and massive flower that, when fully expanded, would measure 9 inches across. The sepals and petals are broad and possess great substance. In growth the plant is most vigorous, with foliage fully 18 inches in diameter. Origin not recorded. Exhibited by LEOPOLD DE ROTHSCHILD, Esq.

Dahlia "Bridesmaid."—This is a single flower of good form and peculiar metallic shade of salmon-pink, passing to orange in the centre. From Messrs. J. CHEAL & SONS.

D. Killarney.—A single flower of light terra-cotta colour with orange-crimson band around the disc. From Messrs. J. CHEAL & SONS.

D. Mrs. Stephens.—A Cactus flower of very pale shade of lemon deepening in colour towards the centre. From Messrs. J. STREDWICK & SONS.

D. Turtle Dove.—A Cactus flower, white, flushed and shaded with crimson. Shown by Messrs. J. STREDWICK & SONS.

Hybiscus syriacus "Snowdrift."—This variety of the hardy *Hybiscus*, known in many gardens by the older name *Althæa frutex*, has pure-white flowers without the semblance of a tint. It is a variety that may be commended to all who cultivate any form of the species. Shown by Mr. R. C. NOTCUTT.

Gladiolus "Yellow Beauty."—This variety has a long spike of large flowers with petals of considerable substance. The colour is sulphur-white, tinted, particularly in the lower segments, with yellow and showing a little purplish-red colour lower down in the interior of the flower. Shown by Messrs. KELWAY & SON.

[Photograph by John Gregory.]

FIG. 83.—*NYPHÆA* "MRS. RICHMOND": COLOUR ROSE-PINK WITH YELLOW STAMENS.

(Received R.H.S. Award of Merit on Tuesday last.)

America occupied more prominent positions. Delphiniums of good form, various Gaillardias, and *Montbretia pyramidalis* were also especially good. This firm also staged a collection of perennial Phloxes; particularly fine were *Iris* (deep heliotrope), General von Heutz, Rheingau (large white flowers with blush eye), and Selma (a fine pink flower with cherry-red eye). (Silver Banksian Medal.)

To the left of the entrance Messrs. W. CUTBUSH & SON, Highgate, set up an attractive display, chiefly of cut flowers, in the style of an exhibition competitive group of plants. The middle front was occupied by a collection of *Nymphæas* in a pool of water; behind the Water Lilies there was a pleasing group of *Lilium sulphureum*. Tall epergnes decorated with various flowers, the most striking being one with *Liatris pycnostachya* and *Gypsophila paniculata*, with a few spikes of *Montbretia*, took the place of the standard *Codæums*. Masses of *Helenium Riverton Beauty* arranged in the form of two mounds were very attractive. (Silver Banksian Medal.)

Messrs. J. KELWAY & SON, Langport, again staged a fine collection of *Gladioli*. *Azurea* is

free-flowering shrubs are not generally hardy. Still, they are valuable for furnishing cool greenhouses in localities where they cannot be grown out-of-doors. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a representative collection of dwarf, free-flowered Cannas. Jewess (pale red spots on a yellow ground), Jean Monval (rich red self), Julius Mez (orange spots on a deep-yellow ground), and Giant Crimson are but a few of the many fine sorts shown. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, arranged a collection of hardy cut flowers. *Stokesia Cyanea*, with single blue flowers, reminiscent of those of the Globe Artichoke, and having the habit of single Asters, was very striking. *Cassia marylandica* is inferior to *Cassia corymbosa*. *Helenium Riverton Gem* was shown in good colouring, and *Liatris pycnostachya*, as well as the more loosely-flowered *L. spicata*, were especially noteworthy. (Bronze Banksian Medal.)

Mr. AMOS PERRY, Enfield, had a fine stand of attractively-arranged Delphiniums, interspersed with various grasses. Besides many standard named sorts, some good seedlings were

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), W. H. White, W. Bolton, Gurney Wilson, H. G. Alexander, Arthur Dye, W. H. Hatcher, W. P. Bound, J. Charlesworth, W. Cobb, J. E. Shill, A. A. McBean, and Stuart Low.

The Duke of MARLBOROUGH, Blenheim (gr. Mr. Hunter), was awarded a Silver-gilt Flora Medal for a very fine group of *Vanda cœrulea* effectively arranged with *Nephrolepis todæoides*, and having graceful Cocos Palms at the back. There were some 80 well-grown plants of *Vanda* furnished with strong spikes of sky-blue flowers having violet-coloured labellums, the exhibit being the more meritorious because the excessively warm weather for several weeks past has been very trying to Indian Orchids from high altitudes.

Whitei, several *C. Thurgoodiana*, *Odontoglossum Harryanum*, *O. grande*, *Oncidium luridum guttatum*, *O. Lanceanum*, various *Cypripediums*, and among species, *Bulbophyllum papillosum*, *Bifrenaria tetragona*, the handsome *Dendrobium MacCarthiae*, *Peristeria elata*, and the singular little *Masdevallia simula*.

Messrs. HASSALL & Co., Southgate, were awarded a Silver Banksian Medal for a group in which the various forms of their pretty *Cattleya iridescens* (bicolor \times Eldorado) were prominent, the pretty, golden-tinted or rose-coloured flowers formed like those of *C. Iris*, varying considerably in tint, the fronts of the labellums being generally ruby-red. Others noted were *C. Thurgoodiana* and a pretty cross between *C. Myra* Peeters and *C. granulosa*; *Lælio-Cattleya Issy*, *L.-C. elegans Harrisii* (a good form, of bright colour), *L.-C. Walter Gott* (in several varieties), *Stanhopea Wardii oculata*, several good specimens of

Messrs. SANDER & SONS, St. Albans, showed *Catasetum reflexum*, a very singular species with greenish sepals and petals barred with purple and having a much-divided labellum.

Messrs. JAS. VEITCH & SONS, Chelsea, showed two fine specimens of *Lælio-Cattleya Dominiana* with large flowers, the sepals and petals of which were bright rose, the showy labellums purple.

A NEW BIGENERIC HYBRID.

Monsieur HENRI GRAIRE, Amiens, showed *Adioda St. Fuscien* (*Ada aurantiaca* \times *Cochlioda Noezliana*), a singular, small-flowered hybrid with nearly equal, lanceolate, red sepals and petals and yellowish, trilobed lip tinged with red.

AWARDS.

AWARD OF MERIT.

Houlletia Wallisii (see fig. 84) from Messrs. CHARLESWORTH & Co., Haywards Heath.—A very

[Photograph by John Gregory.]

FIG. 84.—HOULLETTIA WALLISII AS EXHIBITED BY MESSRS. CHARLESWORTH AND CO.

(Received R.H.S. Award of Merit on Tuesday last.)

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for an effective group. In the centre was a fine plant of *Oncidium luridum guttatum*, with a branched spike of yellow and brown flowers; beside which were several plants of *Dendrobium Phalænopsis Schröderianum*, varieties of *Cattleya Iris*, a magnificent plant of *Aërides Sanderianum*, *Houlletia Brocklehurstiana*, and the rarer *H. Wallisii* (see Awards), *Miltonia Schröderiana* with a spike of 14 flowers, *Renanthera Imschootiana*; and among hybrids *Sophræ-Lælia Gratrixia*, *Sophræ-Cattleya de Vere Beauclerk*, *Sophræ-Lælio-Cattleya Marathon*, and other *Sophræ* crosses, all very bright in colour.

Messrs. STUART LOW & Co., Bush Hill Park, staged an effective group, for which a Silver Banksian Medal was awarded. The centre was composed of *Vanda cœrulea*, on each side of which were *Oncidium varicosum*, and in the group were noted *Cattleya Dietrichiana*, *C.*

Oncidium Papilio, and *Miltonia spectabilis Moreliana*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, secured a Silver Banksian Medal for a group, principally of hybrid *Cattleyas*, which included very fine forms of *C. Adula* and *C. Iris*, several specimens of *C. Pittiana*, *C. Gaskelliana Phyllis* (a very attractive light variety) and selections of *Brasso-Cattleyas* and *Cypripediums*.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed the inflorescence of a new form of *Dendrobium undulatum*, differing from the brown-tinted ordinary form in having the flowers of a pale-yellowish-green colour.

R. G. THWAITES, Esq., Chessington, Streatham (gr. Mr. J. M. Black), showed an interesting collection of hybrids, which comprised several good plants of *Cattleya Adula*, *C. Pittiana*, *C. Roupelliana*, and the pretty *Odonioda Thwaitesii*.

interesting and rare species, originally described by the late Professor Reichenbach in the *Gardeners' Chronicle*, June 5, 1869, p. 611, but which, until now, seems to have been lost to gardens. Of it the author remarks: "A mystery that this showy plant was discovered. It has much of the character of *Houlletia*, and something of that of an *Acineta*. Or is it a mule? Whether that be so or not, it is highly interesting, and is dedicated to the energetic and happy discoverer." In habit the plant resembles *H. Brocklehurstiana* and others of the section which have tall, erect spikes. In *H. Wallisii* the inflorescence is short and decumbent, the large, wax-like flowers, which have a general resemblance to those of an *Acineta*, being of a pale yellow with purple marks on the inside.

CULTURAL COMMENDATION.

To Messrs. CHARLESWORTH & Co. for a magnificent plant of *Aërides Sanderianum*.

(A. Lawrence Sanderianum) with four spikes. The main difference between this and typical A. Lawrence is, that in A. Sanderianum the flowers have a clear yellow ground, while in A. Lawrence the ground is white.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); also Messrs. J. Cheal, H. H. Williams, W. Bates, A. Dean, J. Willard, G. Kelf, E. Beckett, G. Reynolds, G. Wythes, J. Jaques, A. W. Metcalfe, and W. E. Humphreys.

Messrs. LAXTON BROS., Bedford, showed several seedling Plums, one of which received an Award of Merit. The others were a fine, oval-shaped, purple fruit, having a yellow flesh, named Prosperity (raised from Grand Duke \times Czar) and Red Gage, a round, medium-sized fruit of pleasant flavour, the parents being Grand Duke and Greengage. It was decided to send a small deputation of the Committee to inspect the cropping and other qualities of the trees before making awards to these. This firm also showed several seedling Apples. One, named Laxton's Red, was very like the old Quarrenden in appearance, the parents being Red Quarrenden and Allington Pippin. Others were Primate, raised from Lady Sudeley and Cox's Pomona, resembling the latter in shape, and Record, a seedling from Lord Suffield and Emperor Alexander, the fruits much resembling those of Duchess of Oldenburgh. Messrs. LAXTON BROS. were asked to exhibit the fruits again at a later date. This firm also showed fruits and fruiting branches of the Laxtonberry. The berries are large, bright red, and very juicy, but rather acid. It was raised from the Loganberry, crossed with Superlative Raspberry. The exhibitors were invited to send plants to Wisley, where a trial of brambles will be conducted next year.

Mr. A. A. HUMPHREY, 9, Victoria Street, Westminster, showed plants of Maize and green Cobs of the same which had been grown on a house roof at Westminster.

A magnificent collection of some 120 fruit trees in pots was exhibited by Messrs. JAS. VEITCH & SONS, LTD., from their Feltham nursery. The exhibit represented the finest collection of its kind seen at Vincent Square, the trees generally being wonderfully cropped with fine fruits. In the centre were some grand Peach trees, including a splendid specimen of Duke of York variety. Other Peaches included Sea Eagle, Marquis of Downshire, and Late Devonian. Plums included profusely-fruited trees of Early Transparent Gage and Jefferson. Pears also were numerous, and included heavily-fruited trees of Doyenné du Comice, Louise Bonne of Jersey, Williams's Bon Chrétien, Marguerite Marillat, Souvenir du Congrès, Conference, Dr. Jules Guyot, and Clapp's Favourite. The only Apple tree was a single cordon plant 3 feet in height of the variety Rev. W. Wilks, carrying seven fine fruits. There were choice gathered fruits of Lady Sudeley Apple and some superb Pears. (Gold Medal.)

Messrs. H. CANNELL & SONS, Swanley, showed 80 dishes of Apples and a few Plums. These were backed by a row of dwarf Apple and Pear trees in pots. Specially fine cooking Apples were seen in the varieties The Queen, Peasegood's Nonesuch, Warner's King, Stirling Castle, Lord Suffield, Lord Grosvenor, Grenadier, Norfolk Beauty and Ecklinville Seedling. Of dessert varieties there were excellent fruits of Allington Pippin, Margil, Benoni, Duchess's Favourite, Cox's Orange Pippin, Worcester Pearmain, and Rival. Plums were represented by Reine Claude Violet, Mallard, and Jefferson. (Silver-gilt Knightian Medal.)

Messrs. SPOONER & SONS, Hounslow, staged a collection of 40 dishes of hardy fruits, chiefly Apples, including (culinary) Potts's Seedling, Frogmore Prolific, Lord Suffield, Norfolk Beauty, Lord Grosvenor, and Stirling Castle, and (dessert) varieties Carlisle Castle, Jas. Grieve, Benoni, Williams's Favourite (resembling Beauty of Bath), Rival, Early Strawberry, and Quarrenden. (Silver Knightian Medal.)

Messrs. CARTER, PAGE & CO., London Wall, exhibited a collection of 400 dishes of Tomatos, chiefly red-skinned varieties; the fruits were small. At the back were numerous racemes of the pretty Red-Currant Tomato. In dishes were fruits of Fillbasket, Dobbie's Earliest, Champion, Sunrise, Masterpiece, Ham Green Favourite, Wonder of Italy, Lemon Blush, Greengage and Yellow Plum, the last three being yellow varieties. (Silver Banksian Medal.)

Messrs. DOBBIE & Co., Edinburgh, exhibited a fine collection of Potatos in baskets, each containing about 30 tubers. Fine white varieties were seen in Talisman, The Scot, The Admiral, Midlothian Early, Milecross Early, Duke of York, Sir J. Mewelyn, and Sharpe's Victor, whilst coloured varieties were represented by King Edward VII., Purple Eyes, Selected Russett, Eighty Fold, Adirondack, Crimson Beauty, Herd Laddie, and Mr. Bresse. (Silver Banksian Medal.)

AWARD OF MERIT.

Plum Blackbird.—The fruits of this new variety of Plum are borne in great profusion; they are of a medium size, rather long-oval in shape, and of a purple colour. The flesh is of excellent quality for cooking purposes. It was raised from The Czar \times Curlew. (Shown by Messrs. LAXTON BROS., Bedford.)

ABERDEEN ROYAL HORTICULTURAL.

AUGUST 17, 18, 19.—The annual show of this society was held on these dates in the Duthie Public Park, Aberdeen. In point of quality, the exhibition was superior to those of former years; the entries numbered more than 1,600. The secretary and treasurer is Mr. J. B. Rennett, advocate, Aberdeen.

The exhibits of pot plants were the best ever seen at Aberdeen. The specimens were numerous, well grown, and very effectively shown. In the class for four specimen plants in flower (Orchids excluded) Mr. J. LEGGAT, gardener, Balgownie House, Aberdeen, was awarded the 1st prize, a finely-grown specimen of *Statice profusa* in his collection being much admired. Mr. JOHN ELDER, gardener, Norwood, Cults, Aberdeenshire, was placed 1st for four specimen foliage plants. The best specimen plant in flower was shown by Colonel GILL, of Dalhebit (gr. Mr. Alex. Brebner), in a finely-coloured and generally well-grown plant of *Disa grandiflora*. Mr. ADAM MAITLAND, Rubislaw Den House, Aberdeen (gr. Mr. Alex. Duncan), led in the class for a specimen foliage plant with a fine *Maranta*. Ferns were shown well. Colonel GILL, with *Adiantum cuneatum* and *A. gracillimum* well merited the leading place. Zonal-leaved *Pelargoniums* were an outstanding feature, and certainly among the finest ever seen at Aberdeen. Mr. J. D. BRECHIN, gardener, Ardoy, Belhelvie, Aberdeenshire, worthily won the 1st prize in this section. Mr. GILLESPIE, Northfield, Aberdeen, showed the best *Fuchsias*, and Mr. BRECHIN the best *Liliums*. *Begonias*, both single and double-flowered, made a good show, the premier prizes being shared by Mr. W. DICK, gardener, Queen's Road, Aberdeen, and Mr. GEORGE DAVIE, gardener, Hilton House, Woodside, Aberdeen. *Gloxinias* were specially well shown, and Colonel GILL, of Dalhebit, won the 1st prize in the class for these flowers. Exhibits of cut flowers were of exceptional merit. In the class for 18 Rose blooms, distinct, a silver cup was given by Messrs. James Cocker & Sons, Aberdeen. Colonel GILL, Dalhebit (gr. Mr. Brebner), won the trophy with an exceptionally fine exhibit. For six bunches of decorative Roses, Colonel GILL again showed capitally-grown flowers and carried off the society's silver medal. Exhibits of *Pompon Dahlias* were fairly numerous, Mr. J. M. DUNN, Nellfield, Aberdeen, being placed 1st for these flowers. *Cactus Dahlias* were well shown; Mr. W. FLOCKHART, Craigie-buckler Cottage, Aberdeen, won the 1st prize with choice blooms. The collections of 20 varieties of cut flowers and fine foliage bedding plants, including annuals, formed a fine feature in this section. Mr. THOMAS OGILVIE, of Kepplestone House, Aberdeen (gr. Mr. Alexander Douglas), won the 1st prize with a choice exhibit; 2nd, Mr. LEDINGHAM, Queen's Road, Aberdeen (gr. Mr. W. Dick). Mrs. DUNBAR DUNBAR, of Seapark, Forres, N.B. (gr. Mr. J. Gregor), won the silver cup presented by Messrs. W. Smith & Son, seedsmen, Aberdeen, for the best 16 bunches of Sweet Peas, distinct. The blooms were of large size and richly coloured. Sir THOMAS BURNETT (gr. Mr. Petrie) followed closely. One of the best features in this section was the table decorations. Mr. W. CORMACK, Prospect Cottage, Dyce, Aberdeenshire, won the 1st prize with an arrangement of self-coloured Sweet Peas, set in sprays of light *Gypsophila paniculata*.

FRUIT.

The quality of the fruit was well up to that of former years, hardy fruits being especially fine. Mr. HARPER, gardener, Tulliebelton, Perth, showed the best collection of hardy fruits, his Apricots and Plums being exceptionally good. Black Currants have never been shown finer in the north. Those exhibited by Mr. JAMES FERGUSON, Linton House, Sauchen, Cluny, N.B., were as large as Gooseberries and finely flavoured. He won the 1st prize easily. Grapes were limited in number, but good. Sir THOMAS BURNETT, Crathes Castle, showed the best bunches of Muscat of Alexandria and Appley Towers, Mr. JOHN ELDER, gardener, Norwood, Cults, being 2nd with well-finished bunches of Foster's Seedling and Black Hamburg, the latter especially being much admired. Other prominent winners in the fruit classes were Mr. J. LEGGAT, Balgownie House, for Cherries; Mr. ALEX. MORTIMER, Holburn, for Gooseberries; Mr. W. SCORGIE, Springhill, for Melons; Mr. WILLIAM SMITH, Fintray House, for Peaches and Nectarines; Mr. G. MCLENNAN, Fetteresso Castle, Kincardineshire, for Strawberries and culinary Apples; Mr. W. B. GREIG, Balmedie House, for Pears and Nectarines; and Mr. JOHN A. GRIGOR, Seapark, for Tomatos.

VEGETABLES.

The outstanding feature in the vegetable classes was the display of Potatos. First prizes for Potatos were won by Mr. H. B. SMITH, Burdshaugh, Forres, N.B.; Mr. FERGUSON, Linton House; Mr. ALEX. DOUGLAS, Kepplestone House; Mr. WILLIAM MILNE, Carsindae House, Midmar; Mr. JOHN A. GRIGOR, Seapark, Forres; and Mr. WILLIAM WEBSTER, Muireisk, Turriff, N.B. For the best collection of vegetables the Misses MCLENNAN, Springhill, Aberdeen (gr. Mr. W. Scorgie), won the 1st prize easily.

NURSEYMEN'S CLASSES.

Messrs. JAMES COCKER & SONS, Springhill and Sunnyside, Aberdeen, carried off for the third year in succession the society's silver challenge cup offered for the best collection of 36 Roses. The cup now becomes their absolute property. 2nd, Messrs. ADAM & CRAIGMILE, who were placed 1st for 24 Tea or Noisette Roses.

The amateurs made a highly creditable show, Mr. GEORGE MAITLAND, Woodside, Aberdeen, won the Ogilvie Cup for the third time in succession for a fine group of plants. The cup now becomes Mr. MAITLAND's own property.

NON-COMPETITIVE DISPLAYS.

Exhibits were staged by the leading nurserymen, seedsmen, and florists in and around Aberdeen, including Messrs. W. SMITH & SON, Aberdeen; Messrs. JAMES COCKER & SONS, Springfield and Sunnyside; Messrs. BEN. REID & CO., Pinewood; Mr. SINCLAIR, Union Street, Aberdeen; and Mr. DUSTAN, Holburn Nurseries, Aberdeen.

BERKSWELL, BALSALL AND BARSTON HORTICULTURAL.

AUGUST 18.—The annual exhibition of the above society was held on this date. The weather was fine and the show was a decided success. The opening ceremony was performed by Mrs. Feeney in the presence of a company representative of the wide district interested in the day's event.

There were five divisions for exhibitors, and the combined entries numbered about 600. Groups of plants, not for competition, were shown by Mr. J. H. WHEATLEY, Mrs. FEENEY, Mr. HUGH MITCHELL, Mr. G. J. EVESON, and Mr. GUNN, Olton. A feature in the principal tent was the table decorations. The premier award was won by Mrs. H. REEVE, whose exhibit was of pink Sweet Peas. In Division 1, open to amateurs and gentlemen's gardeners, Messrs. HORNSBY, ELLIS and EWEN, and Mrs. SILK were the principal prize-winners for plants, whilst Mrs. BATCHELOR, Mrs. SYNYER, Miss GLADSTONE, Messrs. W. WALSHAW, A. DALE, and F. W. ELSON were the chief prize-winners in the cut-flower classes. Sweet Peas were best shown by Mr. H. WILLIAMS. The principal awards in Division 1 (fruit) went to Mrs. SYNYER, Mrs. BATCHELOR, Miss GLADSTONE, and Mr. PHILLIPS.

NATIONAL HARDY PLANT.

AUGUST 24.—The members of this Society met in conference on the second day of the Shrewsbury Show in the concert room of the George Hotel, Shrewsbury, Mr. A. J. Macself occupied the chair. The subjects for discussion were "Ways and Means of Advancing the National Hardy Plant Society" and "Possible New Methods of Exhibiting Hardy Flowers." Mr. W. H. Paine, of Tully Nurseries, Kildare, introduced the first subject. He advised the National Hardy Plant Society to find out what is being done by other floral societies to prevent duplicating or overlapping of the work. He said that a body of specialists and experts was needed to protect and foster the interests of hardy flowers, and the National Hardy Plant Society was formed for that purpose. Mr. Paine favoured the sending of deputations from the Society to provincial shows, and suggested that the work in this direction would be forwarded if the deputation could co-opt some of the judges appointed by the society holding the show.

The holding of migratory provincial shows in conjunction with established flower shows would, Mr. Paine said, be an excellent means of advancing the interests of the Society, as it had been in the case of the National Rose, Sweet Pea, and other societies. The speaker emphasised the importance of educational work, and said that the Society's existence would not be justified unless it did good work in disseminating knowledge and information on all matters relating to hardy plants. He was of opinion that steps should be taken to organise a series of lectures by prominent authorities on hardy plants, to be delivered under the auspices of the National Hardy Plant Society before gardeners' societies throughout the kingdom, also to arrange for lectures to be given wherever large and important shows were being held.

In the discussion which followed, Mr. Pinches pointed to the difficulties in adopting the suggestions of the speaker owing to want of funds, and he considered that the most pressing consideration at present was how to obtain new members and subscriptions. Mr. Brunton supported Mr. Pinches, while complimenting the enthusiasm of Mr. Paine, and remarked that the excellent programme put forward should be kept on record to be considered when the Society could afford to do such work.

Mr. Harkness said he was much impressed by Mr. Paine's remarks, and hoped that the Society would be able to proceed, along the lines advocated, in the near future.

Mr. Matthew Todd, Edinburgh, said that nothing can at present be shown to prospective members as to the advantages gained by subscribing to the Society's funds.

The chairman, Mr. A. J. Macself, next read a paper on "Possible New Methods of Exhibiting Hardy Flowers." Mr. Macself pointed to defects in the present system of staging hardy flowers, and condemned the massing of flowers in a restricted space without considering the general effect. He said that what is needed is to arrange the flowers as to represent a part of an actual border of growing plants, and that anyone who is capable of arranging plants in a border to produce a pleasing effect should be able to display flowers of these plants on a stretch of ground to reproduce the effect of the border. There are many plants, said Mr. Macself, that show to wonderful advantage when growing over a carpet of some dwarf-growing subject. Gladioli, Liliums, or Camassias thinly dispersed over carpets of *Asperula odorata*, *Teucrium Scorodonia*, the smaller *Funkias*, *Corydalis*, &c., would be infinitely more interesting than when crowded together as we see them now, and exhibits demonstrating the possibilities in this direction would be of distinct educational value.

Mr. Macself also spoke of the value of colour schemes and the grouping of collections of certain families of plants; he also considered that new and improved varieties of hardy flowers should be shown side by side with the older types from which they have been obtained, or to which they are held to be superior. Other points dealt with were the *Violas* and the exhibiting of alpine and rock garden plants.

In the discussion which followed Mr. Frank Bouskell said it would without doubt add immensely to the interest of hardy flowers at

exhibitions if they were shown on the ground after the manner suggested. Mr. Harkness considered the reader of the paper had been unnecessarily harsh on present-day methods of staging, which, after all, had served good purposes, and were largely responsible for the growing popularity of hardy flowers. He had, however, no doubt but that some change on the lines suggested would be beneficial. Mr. Harkness suggested that something should be done to settle the question as to what is and what is not admissible in an exhibit of hardy perennials.

STIRLING HORTICULTURAL.

AUGUST 24, 25.—The annual show of this society was held on these dates in the Albert Hall, Stirling. The exhibition, although a very good one, resulted in a financial loss, owing to the unpropitious weather. This is regrettable, as a financial success would have enabled the society to celebrate its centenary next year in a befitting manner. The entries were almost 200 in excess of last year, all sections showing an increase. The opening ceremony was performed by Major Murray, of Polmaise.

Exhibits of plants were staged in large numbers, and included excellent examples of Zonal Pelargoniums, Ferns, Fuchsias, and tuberous-rooted Begonias. Messrs. H. GRAY, Park Terrace; R. McDONALD, the Elms; and D. CARMICHAEL, Langgarth, were the most successful exhibitors.

Cut flowers provided a strong competition. Dahlias, Sweet Peas, Roses, hardy annuals and border flowers were splendidly staged. Messrs. H. GRAY; C. SHAW, Boquhan; KAY, Gargunock; G. WATSON, Kippen, winning the chief prizes for these. Mr. SHAW arranged the best dinner-table decoration.

The exhibits of fruit surpassed those at any show during the past 20 years. Mr. J. MITCHELL, Airthrey Castle, excelled in the class for four bunches of Grapes; Mr. JAS. WOOD, Dunmore, in that for the best two bunches of Black Grapes; whilst Mr. J. MITCHELL, was placed 1st for two bunches of Muscat of Alexandria. Mr. MITCHELL was also 1st in the class for a collection of indoor fruit. Mr. J. BLACKLOCK, Blairdrummond, was awarded the 1st prize for a collection of hardy fruits. Other prize-winners in the fruit classes were Messrs. H. GRAY, J. K. MESTON, and C. SHAW.

Mr. SHAW won the 1st prize offered for a collection of vegetables, and Mr. WATSON led in the class for a collection of six kinds. In the other classes, Mr. SHAW was the most successful exhibitor.

Honorary exhibits were shown by Messrs. DRUMMOND & SONS, JOHN CRAIG, M. McORNISH, and Miss COLQUHON, all of Stirling.

NATIONAL VEGETABLE.

AUGUST 30.—The second exhibition of this Society was held on Wednesday last in the Royal Horticultural Society's Hall, Westminster. Naturally, owing to an excessively dry season, the number of entries was not so extensive as in the previous year, yet, despite the long period of drought, some 500 to 600 exhibits were staged.

In the President's class for a collection of 12 kinds, the 1st prize was awarded to the Duke of Portland, Welbeck Abbey (gr. Mr. J. Gibson), who showed a splendid exhibit, Ailsa Craig Onion and Perfection Tomato being especially good; Celery, Red Intermediate Carrots, and Best of All Runner Beans were also excellent. The 2nd prize was awarded to Mr. W. FOLKES, Amptill, Bedfordshire; and the 3rd to Mr. W. J. LOBJOIT, Heston Farm, Hounslow, for a collection which included fine Artichokes and Beet.

In the class for nine vegetables, distinct, H. T. TATHAM, Esq., Kendall Hall, Elstree (gr. Mr. W. Gaiger), was awarded the 1st prize for a splendid collection, in which Giant White Celery, Early Giant Cauliflowers, Prizetaker Leeks, Selected Ailsa Craig Onions, and A1 Tomatoes figured prominently. The 3rd prize was won by JOHN KERR, Esq., Loudwater, Rickmansworth (gr. Mr. F. Avery), whose collection contained fine Onions and Artichokes.

The prize offered by Lord Northcliffe for the best collection of six kinds of vegetables was won by R. H. COMYNS, Esq., Heath Farm

House, Watford (gr. Mr. W. Watterton), with an excellent exhibit, in which Ailsa Craig Onions and Pink Perfection Celery were prominent. 2nd, Mr. E. DEAKIN, Hay Hall, Birmingham; 3rd, Mrs. LEWIS DAVIS, Hindhead (gr. Mr. W. H. Masters).

In a class for a collection of three dishes of vegetables, distinct, the prizes being offered by R. Anderson Graham, Esq., and F. W. Harvey, Esq., the 1st prize was awarded to H. T. TATHAM, Esq., Elstree (gr. Mr. W. Gaiger), for a splendid exhibit of Seakale, Beet, Celery, and Earliest White Kohl Rabi; 2nd, the Rev. A. TURNER, Weybridge (gr. Mr. A. Basile), with a collection in which Kohl Rabi and Seakale Beet figured prominently.

The 1st prize for nine Tomatoes was awarded to Mr. W. HUDSON, Leicester, who showed splendid fruits of Conqueror. 2nd, E. G. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson). 3rd, C. NEWINGTON, Esq., The Holme, Regent's Park (gr. Mr. T. Abbott).

In the class for six dishes of Tomatoes, some splendid and numerous exhibits were forthcoming, as might be expected in this hot season. The 1st prize was won by the Duke of PORTLAND (gr. Mr. J. Gibson), with exquisite fruits. The varieties were Best of All, A1, Princess of Wales, Eclipse, Perfection, and Polegate. The 2nd prize was awarded to Mr. W. HUDSON, Leicester; and the 3rd to Mr. R. STANARD, Panshanger, Hertford.

The 1st prize offered by George Munro, Esq., Covent Garden, for the best three Tomato plants in pots was won by Mr. T. ABBOTT, Regent's Park; 2nd, Mr. S. MORTIMER, Farnham.

The 1st prize for six dishes of Peas, distinct, offered by the proprietors of *Country Life* and *The Garden* was awarded to the Duke of PORTLAND (gr. Mr. J. Gibson) for an admirable collection embracing the varieties Superlative, Alderman, Centenary, Duke of Albany, Peerless, and Gladstone; the 2nd prize in this class was won by R. H. COMYN, Esq., Watford (gr. Mr. W. Watterton).

The class for six dishes of Potatoes brought extensive entries of excellent tubers, the prizes being offered by Messrs. Clay and Son. The 1st prize was won by the Rev. A. TURNER. The collection contained the varieties Up-to-Date, Windsor Castle, President, Factor, Progress, and Sensation; the 2nd prize was awarded to Mrs. AUSTEN, Horsmonden (gr. Mr. A. Woodgate), with The Scot, Chieftain, Table Talk, British Queen, Triumph, and The Favourite; 3rd, Viscount GOSCHEN, Hawkhurst (gr. Mr. J. Gilmour).

Exhibits in the class for six dishes of vegetables, distinct, the prizes in which were offered by the Chairman, Mr. Alex. Dean, were limited; the 1st prize was won by Mr. J. CHILD, Milford, Mr. E. SPOONER, Hambledon, being placed 2nd, and Mr. Peacock, Surbiton Hill, 3rd.

SEEDSMEN'S CLASSES.

Messrs. BARR & SONS, Covent Garden, offered prizes in certain classes; in that for six heads of Celery, the 1st prize winner was H. T. TATHAM, Esq.; Improved Snowdrop Potato was best shown by Viscount GOSCHEN, Hawkhurst (gr. Mr. J. Gilmour), whilst Mrs. AUSTEN, Horsmonden (gr. Mr. A. Woodgate), excelled in the class for six Carrots.

Messrs. CLIBRANS, Altrincham, offered prizes for three heads of Clibrans' Pink Celery, the stalks not to be cut; the 1st prize was won by the Rt. Hon. Lord CURZON, Basingstoke (gr. Mr. F. West); and the 2nd by Mr. W. HUMPHREYS, Elstree.

Messrs. W. CUTBUSH & Son's class was for 25 dishes of vegetables, in not fewer than 12 kinds nor more than two varieties of a kind. A splendid collection was staged by the Hon. VICARY GIBBS, Elstree (gr. Mr. E. Beckett). The special features of the exhibit were Barnet Hero and Ailsa Craig Onions, Eclipse and Model Cucumbers, Prizetaker Leek, and Celery.

MESSRS. DICKSON & ROBINSON'S CLASSES.—The 1st prize offered by Messrs. Dickson & Robinson, Manchester, for two bunches of Moneymaker Tomato was won by C. NEWINGTON, Esq., Regent's Park (gr. Mr. T. Abbott), and the 2nd by Mrs. BERNARD, Bridgwater (gr. Mr. W. Cox). In the class for six Onions, the 1st prize was won by the Rt. Hon. Lord CURZON, Basingstoke (gr. Mr. F. West), with a splendid exhibit of very large bulbs; 2nd, A. GALLIALS, Esq., Slough (gr. Mr. E. Johnson); 3rd, JOHN

KERR, Esq., Rickmansworth (gr. Mr. T. Avery). In the competition for six Leeks, the 1st prize was won by Mr. S. BARKER, Worktop.

A fine show of Carrots was seen in the class for six roots. The 1st prize was awarded to Mr. W. T. JEEVES, Holbeach, the 2nd to the Rt. Hon. Lord CURZON, and the 3rd to Mr. T. KING, Chippenham. The Celery class was even, although limited in entries; the 1st prize was won by Rt. Hon. Lord CURZON; 2nd, JOHN KERR, Esq., Rickmansworth (gr. Mr. T. Avery); 3rd, Mr. S. BARKER, Worktop. Exhibits of Beets were below the usual standard; the 1st prize in the class for six Beets was won by JOHN KERR, Esq., Rickmansworth (gr. Mr. T. Avery); 2nd, R. H. COMYNS, Esq., Watford (gr. Mr. W. Waterton); 3rd, Mr. W. COLEMAN, Birmingham; 4th by Mrs. BERNARD, of Bridgwater. Runner Beans were of average quality; the best dish of 24 pods was shown by Mr. W. COLEMAN, Birmingham.

MESSRS. DOBBIE & Co.'s CLASSES.—This firm also offered prizes in several classes. The class for six Leeks of the variety Dobbie's International Prize brought forward a large entry, comprising some splendidly-grown specimens. The 1st prize was won by Mr. R. STUART, Lauder, Berwick; Mr. J. E. ELLISON, Haydon Bridge, being placed 2nd; and Mr. R. H. THOMPSON, Little Haywood, Staffs., 3rd.

ROBERT SYDENHAM LIMITED CLASSES.—A moderate entry was made in Classes 43 to 54, in which Robert Sydenham Limited offered the prizes. The Rev. A. TURNER, Weybridge, showed the best two dishes of Potatos; 2nd Mr. J. WHITE, Bampton, Oxford; 3rd, E. G. MOCATTA, Esq., Addlestone. The best Celery was shown by the Hon. VICARY GIBBS, Elstree; Mr. J. WHITE, Bampton, being placed 2nd. Mr. E. DEAKIN, Birmingham, and Mr. J. WHITE, Bampton, were placed 1st and 2nd respectively in the class for eight Turnips, while for Parsnips the Rev. A. TURNER, Weybridge, was placed 1st, Mr. E. DEAKIN 2nd, and Mr. JAS. WHITE 3rd. For six Carrots, the 1st prize was awarded to the Hon. VICARY GIBBS, Mr. E. DEAKIN being placed 2nd, and Mr. J. WHITE 3rd. The best six roots of Long Beet were shown by the Rev. A. TURNER.

MESSRS. ROBERT VEITCH & SON'S CLASS.—This firm offered prizes for a collection of six kinds of vegetables. The entries numbered two, and in both exhibits Onions and Potatos were good. Mrs. BERNARD, Bridgwater, was placed 1st.

MESSRS. G. MASSEY & SONS offered prizes for two dishes of Potatos, Mr. DENISON being placed 1st; Mr. T. KING, Chippenham, 2nd; and Sir MONTAGUE TURNER, Romford, 3rd.

MESSRS. WOOD & SON'S CLASSES.—Mr. VON AARTMAN, Horsham, won the 1st prize in the class for four dishes of Tomatos, the Hon. VICARY GIBBS being placed 2nd, and the Rt. Hon. T. F. HALSEY, Hemel Hempstead, 3rd. For four dishes of Potatos, Mrs. H. DENISON was 1st, E. G. MOCATTA, Esq., 2nd, and Sir MONTAGUE TURNER, Romford, 3rd. Rt. Hon. H. T. HALSEY won the 1st prize in the class for six Onions. The best three varieties of Celery were shown by the Hon. A. HARTMAN, the Hon. VICARY GIBBS being awarded the 2nd, and Col. Cox, Uxbridge, the 3rd prizes.

NON-COMPETITIVE EXHIBITS.

These were not numerous, but what was wanting in quantity was amply compensated in quality. Messrs. SUTTON & SONS, Reading, arranged a splendid and varied group, comprising all vegetables in season. (Gold Medal.) Messrs. BARR & SONS, Covent Garden, showed a miscellaneous stand of vegetables; all kinds were displayed in an excellent condition, and the arrangement was pleasing. (Gold Medal.) Messrs. DICKSON & ROBINSON, Manchester, showed Melon Manchester, a variety of fine flavour. Mr. R. HOLMES, Tuckswold, staged a new yellow Tomato, for which a Cultural Commendation was awarded. Messrs. DOBBIE & Co., Edinburgh, exhibited a grand collection of Potatos in baskets. (Gold Medal.) Messrs. CARTER, PAGE & Co., London Wall, showed Tomatos in variety; also Dahlias. (Silver Medal.) Messrs. SPOONER & SONS, Hounslow, showed a group of hardy fruit, principally Apples. Mr. S. MORTIMER, Rowledge, Farnham, staged Cucumbers of the varieties Unrivalled and Cynosure. (Silver Medal.)

A GARDENER'S NOTICE: W. C. C. A notice to terminate an engagement given at 5 o'clock in the evening is quite in order, as the notice may be given at any time in the day. With regard to the length of notice in your case, it has been judicially decided that a head gardener is entitled to one month's notice, but there is no reported decision that this would apply to a single-handed gardener. The length of notice, in the absence of a special agreement between the parties, depends on the custom of the locality, as to which you should make inquiries.

BEGONIA SEEDLING: H. B. The flower was withered when it reached us. Send a flowering shoot packed in damp moss, in, preferably, a tin box.

BEGONIAS DISEASED: H. M., Lindfield. The trouble is due to eelworm, which is present in large numbers in the leaves. The pest may be destroyed by pouring two drops of liquid carbon-bisulphide on the drainage materials through the hole at the bottom of the pot. Great care must be exercised in the use of this substance, as it is highly inflammable.

BOOKS: Orchid. The Manual of Orchidaceous Plants (James Veitch & Sons, Ltd.) is not out of print, for we are informed that there are copies still in the possession of the firm. This being the case, your copy will certainly not be worth more than the original price, but it is possible that you may succeed in getting something nearly equivalent to that figure.

BOWLING GREEN: R. H. Plantains should be removed by means of a small trowel or knife. Fill in any holes made in the turf with fine soil and sow suitable Grass seeds. It will be advisable to do the work thoroughly when the season for playing is finished. Mark out the turf in small areas, and remove every Plantain from each patch before proceeding to the next.

CUCUMBERS: H. B. The plants are attacked by eelworm. See reply on "Begonias" to H. M., Lindfield.

FRUITERER'S BUSINESS: W. B. S. It is impossible for us to say which of the towns you mention is the best for opening a fruiterer's business. They are all large places, and no doubt include districts where you would be able to make the venture a success, provided you possess the necessary business ability. With regard to outlay, this will depend entirely upon circumstances, the kind of business you propose to establish, and the thoroughfare which you may select. The profits will depend largely upon the care in management and the class of business; you will have to reckon for a considerable waste in some of the more perishable produce.

GARDENER'S WAGES DURING SICKNESS. H. W. A servant is entitled to his wages when incapacitated from work owing to a temporary illness, but not if the illness be permanent. It is open to either the master or the servant to give proper notice to determine the contract of service, whether the servant is at the time incapacitated or not. In your case, as you are engaged by the month, the proper notice is one month.

GLOXINIAS UNHEALTHY: Isolated. No disease is present in the leaves of the Gloxinias; their appearance strongly suggests the presence of eelworm at the root.

GRAPES "SHANKED": M. S. Your Grapes are not shanked, but affected by a fungus, Botrytis cinerea, which only proves injurious when an excess of moisture is present in the atmosphere. Ventilate the house freely in the early morning.

LIME AND GARDEN PLANTS: H. A. M. Most plants are benefited by a moderate quantity of lime in the soil, with the exception of members of the Ericaceae, including Rhododendrons, Heaths, Kalmias, Andromedas, and other so-called American plants; also a few others, including Lupins, Picea excelsa, and some members of Cucurbitaceae.

MARKET WEIGHTS AND MEASURES: Anxious. The approximate weight of a bushel of Apples is 40 lbs. French Beans are usually marketed in peck and "strike" baskets, these having the same capacity, although of different shape. A peck of Beans weighs 12 lbs.; a tally of Cabbages numbers 60 heads and the same number constitutes a tally of Marrows. A "flat" of Cucumbers, which is the name given to the basket in which Cucumbers are marketed, holds from 2 to 3½ dozen fruits, according to the size of the latter.

NAMES OF FRUITS: Lawrence. Cox's Emperor.—J. S. W. S. Summer Strawberry.—Correspondent. (No letter found.) Small red-skinned Apple, Red Astrachan.—R. Jeal. Castle Major.—B. & Sons.—Black Diamond.—R. Morley. Small's Admirable.—S. C. S. Red Astrachan.

NAMES OF PLANTS: H. A. 1, Zephyranthes candida; 2, Astilbe rivularis; 3, Helianthus laetiflorus; 4, Silphium perfoliatum; 5, Veronica speciosa; 6, Inula racemosum.—J. B. Bruce. Hibiscus syriacus.—Jno. C. Gould. Martynia proboscidea.—W. O. W. 1, Lysimachia punctata; 2, Poterium Sanquisorba; 3, Linaria repens alba; 4, Tunica Saxifraga; 5, Aster ptarmicoides; 6, Campanula Stansfieldii; 7, Hypericum Moserianum; 8, Dianthus arenarius var.; 9, Prunella grandiflora.—By George. 1, Probably Magnolia acuminata; 2, probably Ribes sp., cannot name positively without flowers.—H. Bicknell. Begonia F. W. Farant.—F. C. Nicotiana glauca.—R. O. 1, Oncidium stramineum; 2, Ada aurantiaca; 3, Stelis ophioglossoides; 4, Epidendrum virens; 5, E. floribundum; 6, Brassia bicolor.—H. T. 1, Pteris argyræa; 2, Adiantum tenerum; 3, A. formosum; 4, Pteris tremula; 5, P. hastata.—W. R. P. Bignonia radicans.

ORCHIDS FOR TEXAS: H. R. S. The district around Galveston, Texas, would be suitable for growing a number of Mexican, Guatemalan and other Orchids of the Andean ranges of South America, provided their resting season is arranged concurrently with the period when light frosts are experienced at night and early morning. All Orchids require a tolerably warm temperature and a moist atmosphere during their season of active growth. If these conditions are provided, there should be little trouble in keeping them healthy through the resting season, provided they are kept somewhat dry at the roots. If you grow them, as you suggest, on logs suspended from the trees or fastened to the branches of the trees, the latter would afford shelter, but the plants must be attended to as carefully as they would be when grown in a plant-house. If a glasshouse were available, the plants could be removed to the house to complete their growths, if this were not already finished before winter, and returned to the trees in the open air when mature.

PEACH TREE SHEDDING ITS LEAVES: S. C. S. True "Peach yellow" is a disease not known in Europe. No cure is known for this disease. The spots on the Greengage are the result of insect punctures when the fruit was quite young. Send examples of the leaves for investigation.

PLANTS CAUSING SKIN IRRITATION: G. C. A list of plants which produce skin irritation, and, in some cases, eczema, was published in the issue for August 8, 1908, p. 110.

PRUNING SHRUBS: J. D. C. The removal of dead wood is beneficial in the case of shrubs as in other plants. If dead and diseased shoots are allowed to remain they may encourage the spread of diseases or pests to other parts of the plant. The removal of dead branches will also afford more room for the healthy shoots. If a diseased shoot is cut back into healthy wood dormant buds often develop and send out new branches to furnish the vacant space.

THE MARKET FRUIT GARDEN.

AUGUST began with a very moderate fall of rain; but after the first day of the month no further relief to the drought occurred until the 20th, when the downfall, although greater than for any single day at my station since April 1, was less than half an inch. A little more rain fell on the 21st and 22nd, but making only 0.62 inch for the three days, and bringing the August register up to no more than 0.83 inch for the month. The precipitation was useful in saving certain garden crops from destruction, but was of very little use for fruit trees, and not enough to save from death hundreds of young Black Currant bushes raised from cuttings. My total for four months is only 3.72 inches. The chief benefit of the temporary break in the drought was a moderation of the temperature. Apparently, too, the rain drowned many of the wasps, as they have certainly been less numerous since it fell.

THE FRUIT-GROWER'S PREDICAMENT.

A combination of circumstances in the second and third weeks of August placed the grower of fruit in one of the most awkward fixes that he has ever experienced. Apples were dropping profusely from trees of many varieties, and being devoured to a wholesale extent by wasps, so that gathering before the usual time seemed expedient. But comparatively little of the fruit could be marketed, as

London and markets further north were barred by the refusal of southern railway companies to take consignments, or by the impossibility of obtaining empties, long before the railway men left their work. Consequently, most southern growers too distant from London to send produce by road were dependent upon local markets for its disposal, and these quickly became glutted in consequence of consignments being sent to them from many producers who had never supplied them before, their own usual markets being closed to them. At the same time the intense heat caused Apples stored in barns or fruit-rooms to shrivel or rot badly, while ripe Plums were destroyed on the trees. The glut of fruit—Apples and Plums alike—which followed the reopening of traffic, brought prices down to low rates, from which there is no sign of recovery at the time of writing. Tons of excellent cooking Apples, well graded as firsts, have made no more than 3s. a bushel, and many have been sold at 2s. 6d., with commission and rail carriage to come off, while Victoria Plums, unless large, have fallen to 2s. 9d., and in extreme cases to 1s. per half-bushel. It is doubtful whether there will be much recovery in prices before early and mid-season Apples and all but the latest Plums have been marketed, as it is always difficult to get trade out of a bad depression.

A SEASON OF DISAPPOINTMENTS.

Probably there never was a season in which brilliant prospects for profitable returns to fruit-growers were more emphatically disappointed than they have been this year. So far as the crops are concerned, this has been fully noticed on a previous occasion; but the misfortunes mentioned in the preceding paragraph have come as a climax of disappointment. Apparently early and mid-season Apples and mid-season Plums have turned out better crops than they were at one time expected to be; but, if it had not been for the hurried picking induced by the effect of drought and the wasp plague, the extreme heat of the weather, and the strikes, the markets would not have been so badly glutted as they were in the last 10 days of August.

EARLY AND MID-SEASON APPLES.

So far as culinary Apples are concerned, evidence for some years past has led me to the conclusion that too many Apple trees of early and mid-season varieties have been planted in this country. The earliest, if marketed as soon as they can be, usually make fair prices, because it is only in the early districts that they are ready for market. But as soon as what may be termed the second-earlies are ready, the supply is commonly greater than the demand, which is not very brisk until Plums are finished. Then the great supplies of mid-season Apples, together with a quantity of windfalls from later sorts, usually keep prices low. The case is made all the worse by the practice of many growers who market varieties before the proper time. For example, Warner's King, an October Apple, was in the

market by the middle of August. The position is all the more striking this season, on account of the fact that early and mid-season varieties, dessert and culinary alike, have given by far the best crops. In my own orchard, Beauty of Bath, Mr. Gladstone, Irish Peach, Lady Sudeley, Early Julyan, Domino, Lord Grosvenor, Golden Spire, and Queen have borne well, and Royal Jubilee and Warner's King fairly well; while such late sorts as Lane's Prince Albert, Bramley's Seedling, and Newton Wonder are not up to their average standard of fruitfulness. Reports indicate that the case is the same in many parts of the country.

REFRIGERATION NEEDED.

There is no doubt that it would pay every extensive grower of Apples to have a properly-constructed fruit-house, and probably it would be profitable to furnish it with apparatus for cooling the temperature during the late part of the summer and the early portion of the autumn. This, unless in the case of a man pressed for money, would obviate the necessity of rushing second-early and mid-season Apples into glutted markets in seasons like the present, when fruit must be picked, and cannot be kept well in barns or granaries. Even without artificial refrigeration, the general possession of proper fruit-houses would render advantageous the planting of late Apples almost exclusively, with the object of keeping the fruit until Christmas, or later.

A CURIOUS COINCIDENCE.

Insufficient knowledge as to the circumstances affecting the setting of fruit renders the coincidence of the same varieties of Apples bearing well and others poorly in widely-separated parts of the country a source of wonder. In a great number of reports, Cox's Orange Pippin is stated to be bearing a full crop, and Bramley's Seedling a thin one. No explanation as to the character of the weather prevailing at the time of blossoming applies, because that time is not the same in the late and the early districts.

DEVELOPMENT GRANTS AND FRUIT GROWING.

The Development Commissioners have agreed to provide the Board of Agriculture with about £50,000 per annum for the promotion of research in agriculture, including horticulture. It has been arranged that grants shall be made for research in plant physiology, plant pathology and mycology, plant breeding, fruit growing (including the practical treatment of plant diseases), plant nutrition and soil problems, animal nutrition, animal breeding, animal pathology, dairying, agricultural zoology, and the economics of agriculture. Here we have eleven separate subjects or groups of subjects, and the average amount of funds for each is £4,545 per annum. No doubt, the separate grants will vary considerably, some subjects being in much more urgent need of research than others. Properly interpreted, all the headings of subjects but those

relating to animals and dairying cover horticulture, including fruit-growing; but it will be impossible to tell before definite details of research have been made known whether or not horticulture will receive its fair share of attention. As one who was formerly a corn and stock farmer, and then and ever since intimately connected with public agricultural affairs, I say that I know of no other branch of agriculture so urgently in need of research as fruit growing. The mere treatment of plant diseases, named in connection with fruit growing, is only one of the problems calling for research. Plant pathology and mycology and agricultural zoology in relation to fruit trees and plants are in urgent need of investigation—far more so than in relation to ordinary farm crops, not only because fungus and insect attacks are much more destructive to fruit crops than to ordinary farm crops, but also because very much less is known about the enemies of the fruit orchard than about those which prey upon farm crops.

THE COLOURING OF FRUIT.

The experience of the present season confirms the theory to the effect that rain is needed in addition to sunshine, to promote the full colouring of fruit. I have never seen Czar and Victoria Plums, or Apples generally, develop colour more slowly than they have done during the long days of uninterrupted sunshine which have been so exceptionally frequent this season. *A Southern Grower.*

THE ROSARY.

CULTURAL NOTES FOR SEPTEMBER.

CERTAIN of the plants are now sufficiently ripened to be lifted for potting, but the work must be done carefully, and the roots watered first. I do not advise lifting for ordinary planting yet. If the specimens are potted carefully, stood in a shady position, and syringed frequently, they will make roots during the next two months. Select plants that are at least semi-ripe. Those worked upon the Manetti stock are generally the best for the purpose, as such plants ripen sooner than those on the briar. Rose leaves that have been affected by red-rust disease should be raked up and burned at once in order to destroy the winter spores. No fallen Rose leaves should be permitted to remain in glasshouses for the same reason. If a few pot plants are brought under cover early trim off all the fully matured leaves, otherwise insect pests and diseases will increase rapidly when the main batch of plants is housed. It is time to afford Roses grafted during last winter and early spring their final shift, but do not shift them unless the pots are filled with roots. After potting, it is well to stand them in a deep pit or frame, where they may be protected from rains in autumn, it being essential that the soil shall not become too wet late in the year. Where rains have beaten down the soil, the ground should be loosened by the hoe as soon as possible. Not only will this allow future showers to percolate freely through the soil, but it will conserve the moisture already there, and will also check the growth of seedling weeds. The order for new plants should be placed with the nurseryman as soon as possible, and before the best plants and choicest varieties are sold. Look over any notes taken of Roses at flower shows and other gardens during the summer, but before ordering any unknown variety make certain that it has a robust habit and other good characteristics. The work in the Rose garden during September varies very little from that of August, especially now that most of the plants belong to the Tea and Hybrid Tea sections, and are worked upon the later-growing, dwarf, briar stocks. *Practice.*

TREE FERNS IN THE OPEN.

TREE Ferns are generally considered to be ornamental plants well fitted only for the embellishment of great conservatories and glass-houses; it is seldom realized that it is quite possible in this country to grow them permanently in the open air. A correspondent wrote a few years ago: "If a sheltered spot can be found in the garden, the Dicksonias may be risked outside during July, August, and the early half of September." Happily, there are localities in the British Isles where tree Ferns may not only be "risked outside" for 2½ months of the year, but may be planted permanently in the open gardens. No other class of plants can compare with these noble Ferns in the tropical character of their lace-like crown of fronds, spreading a feathery canopy aloft in shadowy circles, and visitors from colder districts can scarcely be brought to believe that

home for tree Ferns has been found on Sir Arthur Pendarves Vivian's estate at Bosahan, on the southern bank of Helford River, a few miles distant from Falmouth. Here a deep and narrow tree-embowered coombe winds downwards from the higher ground to the water's edge. On either side of the path stand the tall, brown stems, crowned with the green filigree of arching fronds, spreading around in shadowy stillness, enjoying the absolute shelter from winds provided by the thickly-growing trees that clothe the steep sides of the little valley. Even when the waves form "white horses" in the neighbouring channel, scarce a leaf stirs in the recesses of this sequestered retreat, and the memorable blizzard of March, 1891, which caused such damage to vegetation in the south-western counties, caused the Ferns but little harm, although the majority had then been planted only one year. In all, there are about 30 tree Ferns in the dell,

FIG. 85.—DICKSONIA ANTARCTICA GROWING IN THE OPEN AT BOSAHAN, CORNWALL.

they form as permanent a feature in the landscape as the surrounding Oaks, Elms, and Firs that provide the Ferns with the necessary shade and shelter. Such a picture as they present when growing in the open is, naturally, only to be seen under the genial atmospheric conditions that prevail along the southern coasts of Devon and Cornwall, in the Isles of Scilly and in certain sheltered spots in the South of Ireland. Shelter is a most important consideration for these Ferns when grown in the open, and is best provided by trees. Sometimes they may be met with growing on closely-shaven lawns, in quarries and sometimes in deep cuttings prepared for their reception. In such cases, however beautiful they may be as individuals, they impress the mind with being exotic and not indigenous growth, for in their surroundings the work of the hand of man is clearly noticeable. On certain rare occasions, however, they may be seen amid such environment that they appear to have grown from spores where they stand. Such an ideal

most of which are of large dimensions, one particularly—the stately specimen shown in fig. 85. This plant stands in a somewhat isolated position, is 12 feet in height, with a frond circumference of over 50 feet, and has a stem more than 1 foot in diameter. A situation such as I have described is admirably fitted for the culture of tree Ferns in the open, since it provides the requisite shelter, shade and moisture. *Dicksonia antarctica* is, it is believed, the only tree Fern planted at Bosahan, and it is, indeed, the hardiest, as well as the handsomest and best suited for planting in the open in this country. The Ferns have been planted rather more than 20 years, and are in the best of health, none having failed. *Dicksonia squarrosa* is also sometimes planted out, and *Cyathea dealbata* and *C. medullaris* are occasionally to be seen, but they are far more tender than *Dicksonia antarctica*. All the finest specimens of tree Ferns in Devonshire and Cornwall are *Dicksonia antarctica*. *Wyndham Fitzherbert.*

Fig. 86.—THE GRAFT HYBRID, CRATÆGO-MESPILUS ASNIERESII
AND ITS COMPONENT PLANTS.

[From Baür's *Vererbungslehre*.

1, the graft hybrid; 2, *Cratægus monogyna*; 3, *Mespilus germanica*; 1a, 2a, 3a, sections through the superficial tissues of the fruits of the three plants; 1b, fruit of *Cratægo-Mespilus Asnieresii*.

GRAFT HYBRIDS.

(Concluded from page 163.)

THE results obtained by Winkler, since repeated and extended to other species of *Solanum* by Heuer, conclusively established the fact that intermediate hybrid-like types may result from the vegetative union of two races in a graft. The clue to the nature of these intermediate forms came from the results of Prof. E. Baur's work on *Pelargonium zonale*.(*)

Baur found that a race of this species with pure white leaves remained perfectly constant, and that its offspring from self-fertilisation were

that if the growing point is situated in a green part of the mosaic, the adult plant becomes green; if in a white part, the plant is white, and must be grafted on to a green stock, if it is to be kept alive. If, however, the growing point is so situated at the boundary between a white and green region that it consists partly of white, partly of green tissue, the resulting plant will consist of green and white parts united side by side. Such plants are chimæras of green and white components exactly analogous to the chimæras of Tomato and Nightshade which Winkler obtained as a result of grafting. Since

green tissue. Baur's observations show that when leaves are produced from a part of the stem in which this arrangement of the tissues obtains, the leaves have white margins (var. *albo-marginata* of *Pelargonium zonale*). Further, the shoots developed in the axils of such leaves, themselves produce again white-margined leaves.

The white-margined plant is, in fact, a chimæra, but a chimæra in which the boundary between the two components is not radial or anticlinal (as it is in the sectorial chimæras) but parallel with the surface or periclinal.

Evidently, periclinal chimæras may be of different types according to the relative positions occupied by the two kinds of tissue and the number of cell-layers derived from each. Their structure is brought out clearly enough by Baur's striking description of the case in which the epidermis alone is derived from the white tissue: a periclinal chimæra of this kind is, so to speak, a green plant enclosed in the epidermis of a white plant. In other cases the position of the green and white tissues is reversed; in others again two peripheral cell-layers are of the same kind, and no doubt time will provide examples of other possible combinations.

The results of Winkler, which established the fact of graft-hybridism, and those of Baur, which gave the key to its explanation, were attained simultaneously. In commenting upon Winkler's description of his first intermediate type (*S. tubingense*), Baur (‡) suggested the possibility that this plant might be a periclinal chimæra, pointing out that its characters were just such as might be expected of a periclinal chimæra with *S. Lycopersicum* external and *S. nigrum* internal.

Events have shown beyond doubt that Baur's suggestion holds good, not only for *S. tubingense*, but for many other so-called graft-hybrids. Winkler has shown by cytological methods that four of his five intermediate types are periclinal chimæras. The anatomical study of *Cytisus Adami* and the *Cratægo-mespilus* hybrids indicates that they, too, are of the same nature, while Daniel's observations, made before such things as periclinal chimæras were heard of, show sufficiently clearly that his Pear-Quince hybrid is a periclinal chimæra with the tissue of the Quince external.

It is now some years since Macfarlane pointed out how closely *Cytisus Adami* resembles the pure *Cytisus purpureus* in the structure of the epidermis, while its internal structure is like that of *Laburnum vulgare*. Macfarlane speaks of the "hybrid portion" as "wrapped round, so to speak, by an epidermis of *C. purpureus*"; but, lacking the clue since provided by Baur, he did not realise the import of his observations. Further anatomical and historical examination of *C. Adami* by Baur and Buder, confirming Macfarlane's observations, indicates that, so far as one can judge from anatomical evidence, *C. Adami* is *Laburnum vulgare* clothed in an epidermis of *C. purpureus*. In complete agreement with this is the fact that the seedlings which Hildebrand obtained from *Cytisus Adami* proved to be pure *Laburnum*.

In the same way, Baur has shown that *Cratægo-mespilus Asnieresii* (see fig. 87) is a periclinal chimæra, of which the epidermis is that of the Medlar, the internal tissue that of *Cratægus* (*Oxyacantha monogyna*). In *C.-m. Dardari* the two outermost layers are *Mespilus C.-m. Asnieresii* and its parents are illustrated in fig. 86,

[From Kew Bulletin.]

FIG 87.—CRATÆGO-MESPILUS ASNIERESII IN FLOWER, ROYAL CARDENS, KEW.

again white-leaved. But when this white race was crossed reciprocally with a pure green-leaved race, the resulting seedlings showed a mosaic arrangement of green and white parts. The individual seedlings differed among themselves, ranging from white with a few green splashes to green with only minute areas of white. As these seedlings grow, the character of the adult plant is seen to depend upon the distribution of the two components of the mosaic in the region occupied by the growing point. So

the ground plan of such a plant would show the two kinds of tissue arranged as sectors of a circle, Baur distinguished them as "sectorial chimæras."

If the stem of a green and white sectorial chimæra be examined, it will be found that the boundary between the two components is often radial. Occasionally, however, the boundary departs from the strictly radial course and follows such a line that one or more layers of, say, white tissue overlie the more deeply-seated

* Zeitschrift f. Induktive Abstamm.- u. Vererbungslehre, I., 330. 1909.

‡ By permission of the Controller of His Majesty's Stationery Office.

† Zeitschrift f. Induktive Abstamm.- u. Vererbungslehre, I., p. 401. 1909.

which is reproduced by kind permission of the author and Messrs. Bornträger from Baür's *Verebnungslehre*. In the fruit of the White Thorn, the outer three or four layers of the flesh contain coloured sap; these cells are bounded by a single-layered epidermis. In the Medlar the flesh is without colour, and the epidermis gives rise to a well-marked periderm or cork. The section through the graft-hybrid shows that the flesh is typically that of *Cratægus*, but it is surrounded by the cork-layers of the Medlar.

Of the two species of *Solanum* with which Winkler's experiments were made, the Tomato has an epidermis covered with stiff hairs, which are quite wanting in the Nightshade. It is, therefore, an easy matter to observe that, as far as the epidermis goes, certain of the intermediate types resemble the one parent, others the other. But, more than this, the fortunate circumstance that the Nightshade has three times as many chromosomes as the Tomato (the numbers for the somatic nuclei are, respectively, 72 and 24), renders it possible to analyse their chimæras with such precision that the distribution of the two components can be ascertained almost from cell to cell.

Hypothetically, two species united in a graft might give rise to a number of periclinal chimæras differing from one another in the number of the peripheral cell-layers which are derived from the one species. The four types of *Solanum* which Winkler has found to be periclinal chimæras represent the four forms which result when either one or two of the peripheral layers may be derived from either graft-symbiont. Thus, *Solanum tubigenense* consists internally of *S. nigrum*, but its epidermis is *S. lycopersicum*; in the second type the two kinds of tissue occupy the reverse positions; in the third and fourth types the two outermost layers are, respectively, *S. nigrum* and *S. Lycopersicum*.

It may be noticed here that the cytological determinations are supported by the results obtained by breeding from these chimæras, some of which set fertile seed in some quantity. The germ cells are formed from the sub-epidermal layer; chimæras in which one of the species is represented in the epidermis alone should, therefore, produce offspring of the species whose tissues are internal; but chimæras in which the two outermost layers are derived from one species should produce offspring of that species. Three of the chimæras give results in complete accord with this expectation; the remaining one, which has an epidermis of *S. nigrum* surrounding internal tissue of *S. lycopersicum*, has not yet produced any offspring.

There remains another type, called by Winkler *Solanum Darwinianum*, the precise constitution of which is not yet ascertained. Winkler finds that the germ cells of this type have 24 chromosomes; it would appear, therefore, that the sub-epidermal layer at least, in which the germ cells have their origin, must consist of cells with 48 chromosomes, a number which represents the mean between the corresponding numbers for the two pure species (72 and 24).

This case seems to afford some support for an hypothesis which, at an earlier time and in the absence of any plausible alternative, met with some measure of acceptance. The hypothesis sought to explain the origin of graft-hybrids as due to fusions between the vegetative cells of the plants united in the graft; such fusions giving rise to cells of a hybrid nature, from which the new growth was developed. It is no longer surprising that the cytological observations of Strasburger and Noll on *Cytisus Adami*, the *Cratægo-mespilus* hybrids, and the *Bizzarria* Oranges, gave no positive support to this hypothesis, but, as Winkler points out, his investigations into the cytology of *S. Darwinianum* suggest that the sub-epidermal layer of this type, if no other tissues, may be the product of cell fusions.

The result of further investigation into the origin of *S. Darwinianum* will, therefore, be

awaited with the greatest interest, for it provides the only clear suggestion yet obtained that grafting may be followed by cell fusions, with the consequent production of shoots to which the name "graft-hybrid" is more strictly applicable than it is to chimæras, which essentially consist of cells of pure, though of different, lineage.

The spontaneous development of reversionary shoots, which is so striking a feature of the forms now known to be periclinal chimæras, must apparently be attributed to irregularities in the divisions of the merismatic layers. The frequency with which wounding is followed by the development of reversionary shoots, or of chimæras of one kind or another, would appear to be a natural consequence of the structure of the periclinal chimæra; for the death of certain cells and the active growth to which neighbouring cells are stimulated, seem to provide just such conditions as are likely to lead to the arrangement of the two kinds of cells in a new pattern in the new adventitious growths.

Strasburger has suggested that what he terms "hyper-chimæras" may occur, in addition to sectorial and periclinal chimæras. These are conceived to be chimæras in which the cells of the two kinds are more intimately intermingled, so that no great masses of tissue are derived exclusively from one species, as is the case in sectorial and periclinal chimæras. Baür has pointed out, however, that, in the branching of a hyper-chimæra, the two kinds of cells would, sooner or later, almost inevitably get sorted out, so that, at the best, it would be an unstable form.

For the rest, it is obvious that chimæras of whatever kind will be most likely to be produced in shoots which originate actually upon the line of junction between the two graft-symbionts, for it is here alone that circumstances favour the building-up of a single growing point from cells of two kinds. The likelihood of obtaining chimæras depends, therefore, upon the readiness with which the plant forms adventitious shoots in the desired position. Winkler's successful results were achieved in a genus which possesses this power in a marked degree. On the other side, the repeated failures in the genera to which the classical examples belong is accounted for by the rarity with which these genera produce adventitious shoots. That they should ever have produced chimæras seems to have been due to some fortuitous combination of circumstances, which it has not been found possible to imitate. R. P. Gregory.

ORCHID NOTES AND GLEANINGS.

ARACHNANTHE LOWII.

A MAGNIFICENT plant of this beautiful Orchid, which is often known in gardens as *Vanda Lowii*, is blooming in the collection of the Rev. J. C. B. Fletcher, Mundham Vicarage, Chichester. The plant has developed 13 long, drooping spikes, with an aggregate of 368 flowers, forming a cascade of richly-coloured blossoms, the spikes being from 6 to 8 feet in length. Owing, probably, to the great heat of this summer the flowers have developed very bright colours, the contrast of the deep reddish-chocolate of the flowers along the racemes being very striking with the bright yellow of the basal blooms, of which each of the racemes have two, whereas in former years they have borne three and sometimes four.

The plant has two stems, each about 6 feet in height, together bearing seven younger growths from the base. These Eastern Orchids require very careful cultivation, and the Rev. Mr. Fletcher is to be congratulated on his success with them. In the house containing the *Arachnanthe* are fine, healthy plants of the rare *Vanda Dearei* in flower, *V. Sanderiana* with fine spikes, *Arachnanthe Rohaniana*, and other rare species.

The Week's Work.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

BULBS FOR POT CULTURE.—It is now time to order the general stock of spring-flowering bulbs. I prefer to place the order not later than the first week in September, as delivery may then be expected by the middle of that month. In the case of Hyacinths it must be remembered that the largest bulbs do not necessarily produce the finest flower-spikes; in most instances, a medium-sized, solid, heavy bulb is the best, and it is none the worse for having a rough appearance. If bulbs are needed for exhibition purposes the nurseryman should be advised, as he will then select them especially for the purpose; they are, in some instances, given special culture, and are also oftentimes one year older than ordinary bulbs. The remarks, pertaining to size and weight and solidity, apply equally to all bulbs grown in pots. It is scarcely necessary for me to give a list of varieties suitable for pot culture, but if early forcing is practised, then early sorts must be selected. Of Hyacinths I have found the pale Rose variety Baron Van Tuyll most reliable for forcing, also the white varieties Baroness Van Tuyll and General Vetter; or if a double-white variety is preferred, Latour d'Auvergne. Of Tulips, those of the Duc Van Thol type force well, but the variety Vermilion Brilliant is almost as early flowering. Amongst the varieties of Polyanthus Narcissus Bazelman Major, is one of the very finest for the purpose. Prepare the potting soil in advance, selecting, if possible, a sandy loam; if this is not available use road scrapings or silver sand freely in the compost, and add some well-decomposed leaf-soil or manure from a spent Mushroom-bed. It is better to err on the small side in selecting the pots rather than to use pots that are too large; do not allow too much space for drainage. After potting, stand the pots under a north wall on a good bed of ashes, placing a light covering, say a three-inch layer of the same material over them. If possible never use ashes from a household ashbin, as poisonous substances are often deposited therein. I remember a case some years ago of fine Hyacinth bulbs refusing to grow, and this could not be traced to any other cause than contamination of the ashes.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

MASDEVALLIA.—In this interesting genus there are many charming species and hybrids, some of them very distinct, whilst such sorts as *M. ignea*, *M. Veitchii*, *M. Harryana*, *M. Lindenii*, *M. Davisii*, and *M. polysticta* furnish colours that make a brilliant display when in flower. In their cultivation, the great essential is to provide protection from cold, drought, and excessive light. The roots need a sweet, open compost, and the foliage requires to be kept scrupulously clean. If a house or compartment is not given up entirely to the cultivation of these plants, suitable quarters are usually to be found for them in the cool house, arranging them with the *Odontoglossums*, and giving them the same treatment. Any plants requiring fresh rooting materials may receive attention about the present time. The compost should consist of Osmunda fibre two parts, Sphagnum-moss one part, and partly-decayed Oak leaves one part, adding plenty of coarse, silver sand. If the old material is in a decaying state and sour, it is best to shake the whole of it from the roots, cutting away any of the latter that are dead. Repot the specimens, taking care of the roots that are still alive. Any specimens that have become bare in the centre should be broken up, and the divided portions placed in pots just large enough to accommodate them. In the case of healthy plants that only require top-dressing, these should have the surface material carefully picked out and replaced with new, while root-bound plants should be shifted on

with as little root disturbance as possible. Pots, properly drained, are the best receptacles for the species already mentioned, while the many dwarf-habited species are suitable for basket or pan culture, as they thrive most satisfactorily when suspended near the roof-glass. The material should be pressed moderately firm about the roots and base of the plants, which should be kept a little below the rim of the pot, neatly surfacing the compost with a thin layer of clean, chopped Sphagnum-moss. During the period of most active growth, Masdevallias enjoy an abundance of moisture, both at the roots and in the atmosphere, and even in winter the plants must not be allowed to remain dry for a long time, although, perhaps, there is even a greater danger of giving them too much water. Newly-potted plants will require extra care in watering for some time to come, especially those having only a few roots, and these should be afforded more shade than others that are fully established.

THE CHIMÆRA SECTION.—Members of this fascinating group of Masdevallia should receive attention if any plants are in need of fresh rooting material. These plants should be grown in shallow, teak-wood baskets in preference to pots or pans, and, as the scapes frequently take a downward direction, no flat potsherd should be used for drainage. The basket should be lined with Sphagnum-moss, and a similar rooting medium employed to that advised above. The baskets should be suspended from the roof rafters, and as the plants are found in lower altitudes than most Masdevallias, they require a somewhat higher temperature, more especially in winter. From October to March they should occupy a house in which the atmospheric temperature does not fall below 50°. During the rest of the year they may be grown in company with others of the genus, their treatment in all other respects being similar. This section requires much care to keep the plants in good order, as they are subject to the attacks of red thrip and scale, which soon disfigure the foliage, and, if neglected, ruin the plants. It is, therefore, necessary to examine them frequently to prevent the intrusion of these pests, by washing the plants wherever the first trace of them is seen.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

STRAWBERRIES FOR FORCING.—In many places Strawberry plants intended for forcing are backward this season, for, owing to the drought, it was difficult to obtain suitable runners. They should be assisted as much as possible and kept free from weeds, runners, and decayed leaves. Sometimes the foliage assumes a yellow colour, due to ripening, and such leaves must not be regarded as useless, but should be allowed to remain. Allow the plants plenty of room by placing the pots well apart, and, when the latter are filled with roots, apply liquid manure in a diluted state. Soot water is also beneficial and has good effects when syringed overhead. If mildew appears on the foliage, dust the leaves with flowers of sulphur, selecting black sulphur for preference.

PINEAPPLES.—The season has been especially suitable for Pines, and the plants have made good growth. Specimens that need larger pots should be attended to without delay. Suckers may be detached and potted, and winter-fruiting plants may be afforded occasional applications of manure water. Keep the border spaces in the house well damped, maintaining a minimum temperature of 70°. Admit a little fresh air through the top ventilators as early in the morning as it is possible to do so with safety. This will cause any moisture that may have condensed on the fruits to disappear. Pines that are ripening, but are not needed for the dessert at the present, should be removed to a cooler house.

VINES.—Pot vines should be removed without delay to a sheltered position out-of-doors, so that the wood may become thoroughly matured. Gradually diminish the amount of water at the roots, but do not allow the soil to become dust-dry at any time. Young vines planted in borders often continue to grow vigorous late in the season, and it is a matter of some difficulty to get the rods properly matured. A free circulation of

air, whenever the weather is favourable, and a little heat circulated in the water pipes in dull and damp weather and at night time will favour the ripening of the shoots. Although damping down must still be practised in warm weather, less moisture will be required in the borders and on places directly under the growths. Syringe the foliage during bright weather. The bunches on late vines will in most cases be almost perfectly ripened. When the berries are well finished, remove the lateral growths where these are too thick, and especially if they are crowded near to the roof glass. Examine the bunches of Grapes on mid-season vines, and remove any berries that show signs of decay.

THE FLOWER GARDEN.

By R. P. BROTHERSTON, Gardener to the Earl of HADDINGTON, K.T., Tynninghame, East Lothian.

THE MIXED BORDER.—Some people appreciate the mixed border as a repository of flowers for picking, rather than a border capable of presenting changing pictures of floral beauty. Although it is not desirable to gather all the flowers from the border, yet it is sometimes imperative to make use of some of them. If care is employed, some of the blossoms may be removed here and there without them being missed. The perennial Asters or Michaelmas Daisies may usually be cut freely. Some, such as *corymbosus*, *vimineus*, *punicus pulcherrimus*, *Diana*, and *linosyris*, are already in flower, and these will be followed by *Amellus* in variety, *W. Bowman*, *amethystinus*, *Frank Rayner*, *Climax*, *Photograph*, *Tradescantia*, and *ericoides*, which represent a desirable selection. Other subjects in flower include *Lilium tigrinum* (Tiger Lily), *Montbretias* of all kinds, *Rudbeckia speciosa*, *Anemone japonica*, *Anthemis tinctoria Kelwayi*, *Solidago canadensis*, *S. Shortii*, *Bocconia microphylla*, *Lobelia cardinalis hybrids*, *Chrysanthemum uliginosum*, *Gladiolus primulinus*, *G. brenchleyensis*, *B. Lemoinei* in variety, *G. Childsii*, and other hybrids; *Helenium grandicephalum*, *Gypsophila Stevensii*, *G. Rokejeka*, *G. paniculata fl. pl.*, *Hemerocallis aurantiaca major*, *Knifophias*, *Pentstemons*, *Phloxes*, *Clematises*, *Eupatorium ageratoides*, *Statice latifolia*, and seedling Delphiniums. There is a wealth of coloured foliage in the garden, which, with hips of Scotch and Alpine Roses, and seed-vessels of other plants, afford splendid materials for indoor decoration. Such annuals as *Tropæolum peregrinum* and *Nasturtiums*, *China Asters*, *Larkspurs*, *Clarkia elegans*, tall *Antirrhinums*, *Statice sinuata*, *S. spicata* and *S. Suworowii*, *Xeranthemum annuum*, annual *Chrysanthemums* and *Marigolds* are all useful.

CARNATIONS.—The drought has retarded the free rooting of Carnation layers, but if the latter were prepared at the date I advised, they should be ready to transplant into their flowering quarters in the course of the coming week. Early planting results in the plants becoming thoroughly established before the winter arrives, and a much greater quantity of flowers the following summer. If the ground has been manured for a previous crop, no manure should be applied now; but if manure is considered necessary, it must be thoroughly rotted and well mixed with the soil. Where the ground is naturally wet in winter, the beds should be raised, and the surface made slightly convex. Deep planting is to be deprecated, but the ground can hardly be made too firm, provided it is not wet. Where ground game and birds are numerous, means must be taken to exclude them. A few surplus plants of winter-flowering Carnations were planted out in May, and they are now coming into flower; they will provide a pleasing addition in the flower-garden in autumn. The varieties will need careful selecting for planting out-of-doors. Mrs. F. Burnett promises to occupy a foremost place, not only for the colour of its flowers, but also for the neat habit of the plants.

GLADIOLUS.—Hybrids of *Gladiolus primulinus* planted on trial have been very satisfactory, the plants having a very dainty appearance. Seeds of all kinds of *Gladioli* should be saved: the seed vessels should be watched and gathered before the seeds are scattered. Seedling *Gladioli* grow freely, and, as a rule, throw stronger spikes than old corms.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens Windsor.

WINTER LETTUCES.—If seeds of Lettuce were sown a month ago as advised, the young plants should be ready for planting out, for it is necessary to do this before they become drawn. Sufficient room must be allowed for the air to circulate freely amongst the plants and to allow the Dutch hoe being used to stir the soil in the autumn. Choose a sheltered position for planting, where protection may be given if sharp frosts occur during November. A few degrees of frost early in November will sometimes spoil the crop, especially if the plants are wet, and fully developed. The next plantation should be made from plants raised a fortnight later, and these should be planted in cold pits, raising them to within 18 inches of the lights, which should not be placed in position until the late autumn, when they may be used to protect the plants from heavy rains or frost. A sowing of hardy varieties of Lettuce may be made now on a south border to furnish plants for wintering in the open and for planting out in the spring. Brown Cos, Hardy White Cos, Stanstead Park, and Maximum are suitable varieties for this purpose.

ENDIVE.—Continue to plant Batavian Endive, allowing a distance of 15 inches between the plants each way. Choose, if possible, a border which is sheltered from north and east winds, as the plants will afford supplies through November and December if some protection is afforded them during inclement weather. Moisture is the greatest enemy to Winter Salad plants after they have attained their full size, therefore, if lights are available, these may be placed over the plants during wet weather, but air must be admitted freely at all times. As soon as the plants are large enough, some of them should have the foliage tied up when perfectly dry for blanching. The heads should be ready for use in a fortnight after the tying is effected.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.

STRAWBERRIES.—The drought has delayed all planting operations, but it is now imperative to prepare the new beds of Strawberries in order that the plants may become established before winter. Strawberries may be planted at almost any time when the runners are ready, but the present is generally considered the most favourable, especially if the weather be showery. The ground for Strawberries should be trenched to a depth of 18 in. or more, and receive a good dressing of suitable manure. The roots of the Strawberry penetrate to a considerable depth, and it is almost impossible to make the soil too rich or lasting for them. Unless the ground is in a thoroughly moist condition when the plants are inserted, copious supplies of water must be given, until the roots have re-established themselves. It is advisable to have strong plants in reserve to make good any losses in the spring.

PEACHES AND NECTARINES.—The fruits of Peaches and Nectarines are fast ripening, and the trees require a constant attention to keep them in a healthy condition. Syringing should not be practised until the fruit is gathered, but afterwards frequent overhead syringings will become necessary in order to keep the trees clean and healthy. Under dry conditions red spider and other insect pests increase and cause serious damage to the foliage. Wasps are still very troublesome, and every means should be adopted to destroy them.

VINES.—Fruiting vines growing upon walls arches or pergolas should have the lateral growths thinned out to expose the permanent wood and fruit to all the air and light possible. Superfluous branches should also be removed, and those required for next season trained in position by tying or nailing. In favourable situations the earlier varieties are already ripening. The bunches should have the benefit of the sun as much as possible, and if wasps, flies, or birds attack them the bunches should be protected with wasp-proof netting, or enclosed in tiffany or gauze bags, which may be purchased from the sundriesmen. The present season promises to be one of the best on record for outdoor Grapes.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 11—
United Hort. Benefit & Prov. Soc. Com. meet.

TUESDAY, SEPTEMBER 12—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Thomas Smith, on "The Small Holdings Movement.")

WEDNESDAY, SEPTEMBER 13—
Roy. Caledonian Hort. Soc. Sh. in Waverley Market, Edinburgh (2 days) Dickson & Robinson's Vegetable Competitions at Manchester.

THURSDAY, SEPTEMBER 14—
Nat. Rose Soc. Autumn Sh. at R.H.S. Hall, Westminster. Soc. Nationale d'Hort. de France (Paris) Exh.

SATURDAY, SEPTEMBER 16—
Paisley Florist Soc. Chrys. Sh. Elstree and Boreham Wood Fl. Sh.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—57.8°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, September 6 (6 P.M.): Max. 85°; Min. 55°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 7 (10 A.M.): Bar. 30.3°; Temp. 72°; Weather—Sunshine.

PROVINCES.—Wednesday, September 6: Max. 80° Hertfordshire; Min. 61° Ireland N.

SALES FOR THE ENSUING WEEK.

MONDAY—
Twenty-sixth Annual Sale of Pot Plants, at the Nurseries, Chingford, by order of Messrs. H. B. May and Sons, by Protheroe and Morris, at 11.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 10.30.

MONDAY, WEDNESDAY, AND THURSDAY—
Dutch Bulbs and Lilies, at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C., at 12.30.

TUESDAY—
Great Annual Trade Sale of Winter-blooming Heaths, &c., at Burnt Ash Road Nurseries, Lee, S.E., by order of Messrs. B. Maller and Sons, by Protheroe and Morris, at 11.

WEDNESDAY—
Great Annual Sale of Winter-flowering and Other Plants, at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe and Morris, at 11.

200 Cases Liliun Harrisii, Japanese Lilies, also Miscellaneous Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe and Morris, at 2.

A consignment of Palms, Bay Trees, Aspidistras, &c., from Belgium, at Stevens's Auction Rooms, 38, King Street, Covent Garden, W.C., at 1.30.

THURSDAY—
Thirtieth Annual Sale of Winter-blooming Heaths and Ferns, at Longlands Nursery, Sidcup, by order of Messrs. H. Evans and Sons, by Protheroe and Morris.

The Development Grant for Agricultural Research.

The scheme of the Board of Agriculture for the endowment of agricultural research has secured the approval of the Development Commissioners and the sanction of the Treasury. The official scheme, concerning which details were published in these pages last week, contemplates the expenditure of a considerable sum of money up to the maximum of £50,000 per annum.

The principles which the Board proposes to adopt in the expenditure of this research grant deserve the attention of all interested in agriculture and horticulture. Broadly speaking, these principles are the systematisation of research and the co-ordination of research-work in the several branches of agricultural science.

Hitherto, the scientific investigation of agricultural problems has been in large measure casual. Here and there men of ability have taken up this or that question and have tackled it single-handed, sometimes with conspicuous success. Such successes as have been achieved have been due in the main to the practical rather than to the scientific agriculturists, though honourable exceptions must be made in favour of the continuous investigations

of the scientific staff of the Rothamsted experiment station, and also with respect to the younger institution, the Agricultural Department of the University of Cambridge. That the scientific agriculturist has not yet made many deep and abiding impressions on agricultural practice is not a matter for surprise. Agriculture is not only the premier but also the oldest industry. All sorts and conditions of men are engaged in this art, and the ablest of these men have not been slow to discover ways in which the practice of agriculture may be ameliorated. The scientific expert, on the other hand, has had fewer opportunities, largely the result of insufficient financial support and the pressure of multifarious duties; only too often he is expected to devote a considerable number of hours to the laborious work of teaching, to go round the country as a sort of travelling farmers' friend, offering advice which is not always wanted and may occasionally be inaccurate, and in the remainder of his time it is fatuously expected that this expert shall make discoveries which shall revolutionise agriculture. To expect any such thing is sheer nonsense. What was to be expected was what has happened, namely, that such research as has been carried to a successful issue has been, with certain exceptions, both casual and sporadic. The scheme of the Board of Agriculture represents an attempt to reform this state of affairs.

In the first place, money is available. In the second place, and yet more important, men are to be found if it is possible to find them. At the present time the number of investigators who are occupying themselves with agricultural problems is but small. The harvest—to be reaped—truly is plentiful, but the labourers are few. To remedy this fatal defect the scheme of the Board proposes the establishment of a certain number of scholarships for the express purpose of training students to the work of agricultural research. Each scholarship is to be of the value of £150 and to be tenable for three years at one of a number of approved institutions. There can be no doubt that this system of scholarships is an essential condition for the success of the attempt to develop agricultural research. At the risk of hurting susceptibilities, it is necessary to be explicit at this important stage in the history of agriculture and to say that the body of men necessary for carrying out the scheme of research contemplated by the Board does not exist. The men have to be discovered and trained before the scheme as a whole can be developed.

We think that the Board are to be congratulated in thus recognising the need for the provision of recruits to the very small standing army of agricultural researchers, and we believe that they will find themselves spending more money on this object than they at present contemplate or than people impatient for immediate results will think necessary. In the meantime, while the scholarship holders are in training, grants are to be made to those institutions which are in a position to undertake agricultural investigations. Experience

shows that institutions are able, under the stimulus of prospective grants, to improvise any amount of such capacity. The Board will, therefore, safeguard themselves and the public money in the following manner. Agricultural science is divided for the purposes of the scheme into a number of sections, namely, plant physiology, agricultural zoology, animal and plant nutrition, and soil problems, genetics (animal and plant-breeding), pathology (diseases of animals and plants), dairying, fruit-growing, and the economics of agriculture.

Each of these subjects is to be "farmed out" to one or more institutions in which are workers who have specialised in the subject. The advantages of this method of giving out research piece-work are great, but there are also grave disadvantages attaching to it. The advantages are that the even development of the several branches of agriculture is encouraged and that certain of these branches are not neglected for studies which are at the moment more in fashion. Groups of workers will be encouraged by this system to co-operate toward the solution of those "border-line" problems of which agriculture presents so many, problems which stand on the no-man's land which bounds such sciences as botany and zoology. The disadvantages are that the scheme prevents over-lapping, and over-lapping in research is an excellent thing. It tends, moreover, to make each agricultural research institution too much of the nature of a technical institute for the investigation of one department of agriculture. We shall have soil institutes, genetics institutes, dairy institutes, and so on. It is true that freedom is thriftless, and, therefore, not apt to find favour with Boards or Treasuries; but it is equally true that without freedom the best kind of research is likely to remain undone. The weak point of the scheme would appear to be that it makes no provision for one or more agricultural universities—places where agriculture is studied from a research point of view in all its branches and where soil men meet with dairy men and genetics is cheek by jowl with pathology.

Nevertheless, the scheme will, we think, command the general approval and support of all friends of agriculture and horticulture. It represents an attempt to provide what is greatly needed—a body of highly-trained and efficient experts, who will devote themselves both to the investigation of agricultural problems and to the dissemination of knowledge of value to the farming community. It leaves the work of mere demonstration on one side and divides research into two sections: one general or universal, the other—and no less important—local. If successful, then in 10 years' time we shall have in this country a group of men who are not only discovering the best methods of growing plants and rearing animals, but who are able to go to this field or that orchard and tell the grower who wants help what kind of permanent pasture, what combination of manures, and what remedial measures against disease he is bound to adopt if he is to secure the best results from his labours.

A NEW CHINESE WALNUT.
JUGLANS CATHAYENSIS; SHOWING FOLIAGE AND FRUITS.

SUPPLEMENTARY ILLUSTRATION.—*Juglans cathayensis* (Dode)* belongs to the same group as *J. cordiformis* and *J. mandshurica*, these latter species being fairly well-known trees in this country. A tree in Messrs. JAMES VEITCH & SONS' Nursery at Coombe Wood, raised from seeds obtained from Mt. Omei, Western China, in 1903, and sent to Messrs. VEITCH by Mr. E. H. WILSON, has recently fruited, thus supplying the materials for our illustrations. Mr. WILSON gives us the following particulars:—*J. cathayensis* forms a deciduous tree, growing sometimes 70 feet high. The shoots are covered in their first year with very viscid, gland-tipped hairs, and these are also found on the peduncle, fruits, and leaf-rachis. The leaves are pinnate, multijugate, the largest 2 feet to 2½ feet or more in length. The leaflets are ovate-oblong, 3 inches to 6 inches long, 1½ inch to 3 inches wide, and obliquely rounded or subcordate at their bases. They are acuminate; the margins being finely serrated. There are short, scattered hairs on the upper surface of the foliage, which is a paler colour beneath, and furnished with a pale, stellate pubescence. In addition to this stellate pubescence, the midrib is densely set with viscid glandular hairs. The male catkins are cylindrical, pendulous, 9 inches to 15 inches long. The fruits are produced in clusters of six to ten, towards the end of the spike, which is about 6 inches to 9 inches long. They are egg-shaped, 1½ inch to 1¾ inch long, pointed and very viscid. The nuts are similarly shaped, the rind being from ¼ inch to 1-6 inch thick. The nuts are ovoid (see fig. 88), sharply acuminate, six to eight angled with irregularly-serrated, almost spinescent, angles and wrinkles, six to eight lacunæ on inner side of the endocarp. The plant does not exactly agree with Monsieur DODE's description, but from my knowledge of the tree in a wild state, I believe them to be identical. M. DODE describes the nuts of *J. cathayensis* as being "larger than those of *J. mandshurica*† and *J. stenocarpa*,‡ with six to eight rather distinct angles, more or less acute at summit, furnished with numerous chambers (lacunæ), greyish outside and roughish, but with obtuse wrinkles." The nuts I collected differ in having usually a very acuminate summit and sharp almost spinescent angles and wrinkles. In old nuts that have been handled somewhat, these sharp edges get worn almost away, as is seen in fig. 88. M. DODE founded another species (*J. Draconis*)§ on HENRY's No. 10,498 B. from Yunnan. He describes the nuts of this species as being "not larger than *J. cathayensis*, eight angled, and often very acuminate at the summit, with the wrinkles often rather sharp, but with only four lacunæ." HENRY's specimen in Kew Herbarium, bearing the above number, shows a fairly smooth nut, having six lacunæ, and foliage identical with that of *J. cathayensis*. These lacunæ are formed by the undulating growth of the endocarp, and vary in number according to size of fruit and conditions in which the fruit has grown. *J. cathayensis* is the common wild Walnut of Central and Western and South-western China. At low altitudes it forms a small, bushy tree 15 feet to 30 feet high, flowering and fruiting when 8 feet to 10 feet high. In the woods and forests it occasionally makes a large tree 40 feet to 70 feet high, and 5 feet to 8 feet in girth. The leaves on young plants are often a yard long, rivalling those of *Ailantus* and *Cedrela*. The male catkins are borne on shoots of the past and current seasons' growths, and are often more than a foot in length. The female

flowers are sub-terminal, racemose, and have pink coloured pistils; the peduncle elongates after fertilisation has taken place. The bark is a light shade of grey and smooth, becoming rough and dark-coloured in old trees. The seed is sweet and pleasant flavoured, but the endocarp is so hard and the seed so difficult of extraction that it has but little edible value. *J. cathayensis* is undoubtedly closely allied to *J. stenocarpa*, Max., and is probably nothing more than a southern form of that species. M. DODE refers some of MAXIMOWICZ's Amur specimens to *J. cathayensis*, but it seems strange for this plant to extend so far to the north and

[Photograph by E. J. Wallis.]

FIG. 88.—FRUIT OF *JUGLANS CATHAYENSIS* WITH PORTION OF THE PERICARP REMOVED, AND SECTIONS SHOWING THE RIDGES AND LACUNÆ.

there exist alongside its close ally *J. stenocarpa*. Until we have definite proof to the contrary, it seems advisable to retain MAXIMOWICZ's name of *stenocarpa* for the Amur plant, and restrict the name of *cathayensis* to the wild Walnut of China proper. *J. cathayensis*, according to M. DODE, is in cultivation with M. VILMORIN at Les Barres, from seeds received from Père FARGES in 1899. *J. Draconis* is, on the same authority, said to be cultivated by Messrs. SPÄTH, Berlin.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, September 12, in the Vincent Square Hall, Westminster. At the three o'clock meeting in the lecture-room, an address on "The Small Holdings Movement" will be delivered by Mr. T. SMITH.

NATIONAL ROSE SOCIETY.—The autumn Rose show of this Society will be held in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, the 14th inst. Mr. EDWARD MAWLEY, the hon. secretary, informs us that, as the past month has, at all events in the southern half of England, being so dry and otherwise unfavourable for the production of blooms in the early autumn, several new and suitable classes, both for nurserymen and amateurs, have been added to the schedule.

"THE ORCHID WORLD."—The number of the *Orchid World* for September contains a description of Mr. Thwaites' Orchid collection at Streatham Hill, and illustrations of some of the more notable hybrids raised from crosses made under his supervision, including *Sophro-Cattleya Thwaitesii*, *Odontoglossum Rolfeae* Thwaites' variety, *Cattleya Maggie Raphael alba*, and *Odontioda Thwaitesii*. This issue being number twelve, it marks the conclusion of the first volume, and an index for this volume is included in the text.

BLACK CURRANT RUST.—This rust is frequently met with in fruit plantations towards the end of the summer. The fungus which causes it is called *Cronartium ribicolum*, and it has an interesting life-history. Like *Puccinia graminis*, the black rust of cereals, *Cronartium ribicolum* is a heteroecious parasite, i.e., it lives on two different host plants at different stages in its life-history. In the case of *Cronartium ribicolum* the two hosts are the Weymouth Pine (*Pinus strobus*) and the Black Currant. The spores produced on this Pine earlier in the year infect the leaves of the Black Currant on which the fungus forms two other kinds of spores—uredospores and teleutospores. The uredospores first occur in small pustules on the under surface of the leaf, but later their place is taken by the teleutospores, columns of which appear as small, brownish and hair-like projections. Unlike the teleutospores of many other rust fungi, these spores germinate at once, forming other spores, which in turn infect the Weymouth Pine. I have only once seen this rust on Red Currants, and in this case the Red Currants were near Black Currants, which were badly infected with the parasite. The uredospores of this rust have the power of infecting Black Currant leaves again, but whether they are capable of retaining their vitality throughout the winter, is uncertain. The recurrence of this rust in Cambridgeshire year after year is remarkable, because the Weymouth Pine is not a common tree in the county, and the present winter has not seen a specimen of it affected with the rust.

THE RAINFALL.—In a lecture on "Rainfall," delivered at a recent meeting of the British Association, Dr. H. R. MILL, said that the rainfall of the country was never everywhere above the average or everywhere below in any one year, and parts of the country might suffer from a deficiency of rainfall year after year, while other parts perhaps not very far away suffered equally from a great excess. In 1908 and 1909, for example, the south-west of England was extremely dry, but in 1910 the same region was extremely wet. Taken as a whole, however, the total rainfall of the country fluctuated from year to year. From 1872 to 1883 there was a great predominance of wet years; from 1889 to 1909 there was an unbroken repetition of two dry years followed by one wet, while it seemed possible, despite the drought of the present summer, that we were now entering on a spell of years among which the wet would predominate.

THE ORIGIN OF CULTIVATED BEGONIAS.—

Among the subjects discussed at the Congress of Horticulture held in Paris in May last, one of the most interesting was that concerning the origin of cultivated Begonias. Monsieur BELLAIR, who introduced the subject, pointed out the large part hybridisation had played in the production of present-day forms. Of the hybrids which have been raised, two classes may be distinguished, those which are fertile and those which are sterile. The fertile hybrids include the tuberous-rooted section, which has been produced by crossing and recrossing at least five wild species, *Begonias boliviensis*, *Veitchii*, *rosæflora*, *Davisii*, and *Pearcei*. Besides the tuberous-rooted Begonias, another fertile race is that known as *gracilis*, produced by crossing *Begonia semperflorens* with *B. Schmidtiana* and appearing in three coloured forms, white-flowered, rose-flowered and red-flowered. Other fertile hybrids of probably a similar origin are *Lumineux* and *Lubecca*, and perhaps *Gloire de Chatelaine*. The last-named has but a very reduced fertility. According to Monsieur BELLAIR, the two best-known reputed sterile Begonia hybrids are *Gloire de Lorraine* and *Patrie*, both of which claim *Begonia socotrana* as the female parent. *Gloire de Lorraine* is believed to have been obtained by crossing *B. socotrana* with *B. Dregei*; *Patrie* from *B. socotrana* and *B. Pearcei*. Not infrequently the female flowers are absent, and even when they occur they are few in number, and are said to be sterile to their own pollen. Monsieur BELLAIR pointed out that the hybrids of the tuberous-rooted section are derived from parents which do not present marked dissimilarities one from the other; whereas the species from which come such sterile Begonias as *Patrie*, differ from one another markedly and in many ways; in the shape of their leaves, in their season of flowering (*Begonia socotrana* being a winter flowering and *B. Pearcei* being a spring flowering species), and in form of their rhizomes. It is to the fundamental differences in constitution between the parents of *B. Patrie* and other hybrids of this class that M. BELLAIR attributes the sterility of hybrids. Sterility is, however, a very subtle and erratic phenomenon, as to the cause of which we have as yet little or no certain knowledge.

SOCIETY OF AMERICAN FLORISTS.—The annual convention of this society constitutes one of the most important events in the American horticultural world. The 22nd meeting was opened at Baltimore on August 15, under the presidency of Mr. GEORGE ASMUS. After the address by the president, and the transaction of formal business, the meeting was given over to the reading of papers and the consideration of suggestions put forward by the members. There was also a great horticultural display, and the usual social functions, which are inseparable from meetings of this character. The keenest discussion was centred around a proposition to change the time of the convention to March, but it was finally decided to hold the next meeting in the autumn, at Chicago. The membership of the association exceeds 1,100, and embraces most of the principal florists and nurserymen in the States. A gloom was cast over the proceedings by the sudden death, on the first day, of Mr. JOHN BIRNIE, one of the oldest members.

THROUGH LITTLE NAMAQUALAND WITH THE VASCULUM AND THE CAMERA.*

(Continued from p. 167.)

NORTH of Annenous, the road to Bethany Drift soon becomes involved among the mountains. Here and there they open out to give place to an undulating plain, but they are never out of sight. They attain no great height, the highest peaks hardly exceeding 4,000 feet. Their geological structure is exceedingly complex; sedimentary rocks are few; minerals of various kinds are abundant. The country as a whole is in a state of virgin wildness, and bears but slight traces of human occupation. Game abounds everywhere except in the immediate vicinity of the few native hamlets.

There can be little doubt that this region still contains a great many species unknown to science. It has hardly been touched by a botanical collector since the time of Drège, and

Meyer's account of Drège's journey and collections,§ the course of the Orange River is incorrectly laid down. Drège's well-known locality, Verleptpram, is there placed a little to the west of the junction of the Visch River with the main stream of the Orange. If this is near its true position, it lies within the area defined in the last paragraph, somewhat to the east of the centre of its northern boundary. The name Verleptpram seems to be no longer used for any location or hill in the neighbourhood; neither missionaries, police, prospectors nor natives have any knowledge of it. It was probably applied to a "farm" long since abandoned, and there is no reason to hope that it will ever be identified.

Not far from the centre of the Richtersveld, at the head of a wild ravine appropriately known as Hell's Kloof, there occurs a remarkable spring of slightly saline water.|| This falls into a very deep rock-basin hardly more than three yards

FIG. 89.—*ALOË PEARSONII*, SCHÖNLAND.

(In the Richtersveld near the top of Hell's Kloof.)

the 509 species of flowering plants which he obtained north of the Koussie (Buffels) River† were gathered between August and October. No part of this region is of greater promise botanically than that which lies north of a straight line drawn east and a little south from the mouth of the Orange River to the point where it intersects the river at Tc Alys Drift (long. 17° 30' E.). Except near the mouth, the tract which intervenes between this line and the Orange River‡ is a tumbled mass of mountains without roads, and only crossed here and there by a few little-known native footpaths, which very frequently assume the character of steep and irregular stairways. In the summer it is almost without available water, and even in a wet winter it may only be attempted under good guidance and with no transport heavier than a pack mule. Near the river, the hills are very barren; away from it they bear a rich array of low bushes and succulents, while in sheltered kloofs tall shrubs and a few trees (*Acacia horrida*, *Euclea Pseudebenus*) afford a fairly dense cover.

In Arrowsmith's map, which accompanies

across at the top. The supply is permanent, and the overflow irrigates the bottom of a narrow valley for some distance from the reservoir. This basin, no doubt, originally a mere fissure in the rock, is overhung by a great mass of quartzite, so situated as to shelter it completely from direct sunlight. For some distance above the water's edge the rock bears a dense and flourishing growth of Maidenhair (*Adiantum æthiopicum*), which seems strangely out of place amid the succulents and gnarled bushes which cling to the rocks above it. This appears to be the first record of the occurrence of a Maidenhair in Namaqualand.¶ It is quite impossible that it can have reached this isolated position except through natural agencies, and its presence here constitutes an interesting problem in plant distribution. Associated with it are a delicate, white-flowered plant (undetermined) and at least one species of *Chara*, while access to the pool is here and there impeded by a dense growth of Reeds (*Arundo*). On the damp ground which receives the overflow there are fine trees of *Acacia horrida* with *Tamarix articulata*, *Statice scabra* and various grasses, sedges and rushes.

§ E. H. F. Meyer, *Comm. de Pl., Afr. Austr.*, 1835.

|| About 3,000 feet s.m.

¶ *Adiantum capense*, Thb., collected by Drège between Natvoet and the Orange River—*Cheilanthes capensis*, Swt. (Sim., *The Ferns of South Africa*, p. 82.) The genus is probably represented in the Khamiesberg.

* Being some notes on the Percy Sladen Memorial Expedition to the Orange River, 1910-11. This expedition was assisted by a grant from the Royal Society.

† Drège's region III, B, which yielded 509 species of flowering plants, includes a large tract of country south of Annenous.

‡ Includes the greater part of the "Richtersveld."

Succulents, many of them with brightly-coloured foliage, are predominant among the vegetation of the surrounding hills. They include *Mesembryanthemums* (among which are the giant species referred to in the last article, and another closely allied to, if not identical with, *M. Burklyi*), *Crassulas*, *Cotyledons*, *Zygophylla*, and an *Aloë*, which Dr. Schönland has described as a new species** (see fig. 89). Like many other species, this one is gregarious. It is so thickly spread over the hill slopes (especially those with a more or less westerly aspect) that, when seen from a short distance, they appear to carry no other vegetation. It has not been found outside the Richtersveld area, within which it is extremely abundant from Numees Mine southwards to the settlement of Kuboos (some 20 miles). Its slender, erect stem, rarely more than 2½ or 3 feet high, is closely beset with drooping leaves; the reddish-bronze colour of these gives to the plant a remarkable and characteristic appearance. From its summit there arises the slender raceme, bearing flowers varying in colour from a delicate lemon yellow to a bronze-pink. It is a very striking plant, with good claims to be regarded as ornamental.

The Richtersveld Mountains are rich in *Euphorbias*, some species of which are represented by numerous individuals. The most remarkable of these is, perhaps, *E. Drègeana* (see fig. 90). It occurs in great abundance on the lower hill slopes between the Orange River and Annenous. Drège collected it not far from Annenous (Kookfontein or Steinkop, lat. 29° 15'), and again south of Silverfontein (lat. 29° 50'). Its southern limit is about latitude 30° (a little south of the Buffels River). From this point northwards it increases in importance until it attains its maximum development a little south of the Richtersveld. Beyond this it becomes less abundant. It doubtless occurs north of the Orange River, though it apparently dies out entirely south of the latitude of Lüderitzbucht. It is not known from Bushmanland, but it extends to the borders of that country at Eenriet, a water-hole N.E. of Steinkop. Wherever it occurs—on rocky hill slopes or sandy levels—it is a conspicuous plant. It is taller than the great majority of its neighbours; its leafless,

grey stems are circular in section and as thick as an ordinary spade handle. They give rise at the summit to a few short, slender branches, which bear the large and somewhat conspicuous flowers. This is probably the only Namaqualand

the Richtersveld was previously obtained from undefined localities in Namaqualand by Atherston and Wyley, and was described by Sondou, from incomplete material, as *Portulacaria namaquensis* (Portulacaceæ). It is, without doubt,

FIG. 91.—A SPECIES ALLIED TO *PORTULACARIA NAMAQUENSIS*, SOND.
"TREES" 12-15 FEET HIGH.

(The photograph was taken at Aggenys, in Bushmanland, in 1909.)

Euphorbia whose economic possibilities have attracted serious attention. It yields a copious supply of latex, which is said to contain a high proportion of rubber. The rubber-yielding properties of the Namaqualand *Euphorbias* call for further investigation.

One of the most remarkable of the plants of

closely allied to *Portulacaria*, but it differs from that genus in certain important characters of the ovary and fruit. It is therefore proposed to place it in a new genus together with two other species as yet undescribed. One of these was found in 1909 on granite hills in Bushmanland, Aggenys, Henkiesfontein, and Dabainoris (see fig. 91). In the last locality it grows on the same slopes as *Pachypodium namaquanam*.†† Like the Richtersveld species, it is a tall bush (8-15 feet), with stout stems branching in an apparently dichotomous manner. These are protected by layers of cork, which are impregnated with a substance of the nature of wax. In the Bushmanland species the wax is so inflammable that the living bush will burn energetically as it stands. The third species, one of the commonest plants on the Richtersveld Mountains, is smaller than the others; its branches are more slender, and their corky covering contains less wax; its flowers are fewer and more scattered than in the other species, but in all three their structure is remarkably similar.

These three species being generically distinct, *Portulacaria* remains monotypic. Its only species, *P. afra*, Jacq., the "Spekboom," is a characteristic Karoo plant. But the two genera are closely allied, and their distribution affords further evidence of the relationship between Namaqualand and the Karoo. The proofs of this relationship are so numerous that in 1886 the late Dr. Bolus regarded them as constituting a single botanical region. More recently he considered the Western Coast Region as distinct from the Karoo,‡‡ a conclusion which is generally adopted. Nevertheless, the high degree of affinity which exists between these two regions must not be lost sight of in the framing of a hypothesis to account for the present distribution of plants in South-west Africa. H. H. W. P.

(To be concluded.)

NOTES FROM LEONARDSLEE.

BIGNONIAS.—At the present time *Bignonia grandiflora* is a gorgeous sight on the walls of the mansion, and also on a high wall devoted to rare and tender plants. The plants are masses of long sprays of handsome flowers 2 feet to 3 feet long. The soil was enriched last autumn with fresh loam and bonemeal, and this, together with the tropical summer, has brought about such excellent results in flowering. The smaller and hardier *B. radicans* has been in flower for nearly a month. Another *Bignonia*, of Continental origin, named *Mme. Salen*, which we consider to be a hybrid between *B. grandiflora* and *B. radicans*, is also finely in bloom. This variety is very free in blooming, the flowers being somewhat darker in colour than those of *B. grandiflora*, and in size and shape somewhat between the two species named. *Bignonia*s flower here every year, early or late according to the season, and sometimes very late if the season is damp and cold. In unfavourable summers they are not so attractive, but they are certainly worth cultivating.

MANDEVILLA SUAVEOLENS.—This beautiful climber has been in profuse flower for a month past, having benefited greatly by the brilliant sunshine. Trained against a warm wall in a position where plenty of moisture may be afforded the roots, the plant makes a peculiarly handsome subject, and produces sweet-smelling flowers.

DESFONTAINEA SPINOSA.—This plant has flowered abundantly, even small plants 6 inches high, and both in the shade and full sunshine. This beautiful shrub is always admired for its scarlet and gold coloured blossoms.

MITRARIA COCCINEA has been in flower for two months, making an exceptionally showy and beautiful spectacle. Our plant is growing in a shady, well-drained bog, where it finds everything necessary for its welfare.

PHILESIA BUXIFOLIA.—At Leonardslee the box-leaved *Philesia* is planted in a position under a rock, and has been blooming all through the summer. This is a choice and beautiful plant, with flowers resembling small *Lapageria* blooms.

MYRTLE.—A plant of *Myrtus* "Jennie Rutenbach" is one mass of flowers, the dark green foliage forming a beautiful setting to the pretty double-white blossoms.

TRACHELOSPERMUM JASMINOIDES.—This shrub has been a wonderful success this season, and has bloomed profusely on a wall facing south-west. The fragrance of the flowers is apparent even at a distance of 20 yards.

EUCRYPHIA PINNATIFOLIA.—This choice flowering plant was quite three weeks in advance of its usual flowering time, but the blossoms were not so good as usual owing to the hot, dry weather.

ROMNEYA COULTERI.—The Californian Poppy has been, and is still, a glorious spectacle, having enjoyed the rich sunshine. It is a beautiful flower for a hot season. This plant enjoys plenty of moisture.

DENDROMECON RIGIDUM has flowered all through the summer, and has made wonderful growth. The plant enjoys a warm position and plenty of water. All the plants I have mentioned are benefited by a spraying of clear water at night.

LAGERSTRÖMIA INDICA.—This fine flowering plant is exceptionally well bloomed this season, and is a beautiful addition to wall climbers in August. We have it planted as a shrub in the open under shelter of *Pinus sylvestris*. The large, bright spikes of flowers are very pretty, and decidedly interesting. *W. A. Cook, Leonardslee Gardens, Sussex.*

AN ABNORMAL SWEET PEA.

An abnormal flower of Sweet Pea was brought to our notice recently (see fig. 92), in which the parts are duplicated, some of them several times. The specimen has the appearance of a very large double flower with several standards and many wings. It is an abnormality which frequently occurs in Sweet Peas, and consists of splitting up of the flower into a number of flowers; this, however, is not complete but partial. There are representatives of four or five flowers, as is shown by the equivalent number of pistil, stamen, and petal groups; but these are all enclosed within a common calyx and part, at any rate, of a common corolla. The characteristic papilionaceous corolla of each of the subsidiary flowers may be distinguished, but, owing to the great crowding caused by so many flowers arising within a single calyx, the petals are considerably crushed, and some of them imperfectly

FIG. 92.—ABNORMAL FLOWER OF SWEET PEA.

developed. The condition is essentially the same as that which occurs in fasciated shoots, namely, the single organ divides at the apex by multiple forkings into a number of secondary organs.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE POTATO CROP.—I read with interest the sanguine letter by *A. D.* on p. 154, respecting this season's Potato crop, and, I regret that I am not able to echo his optimistic remarks on the subject from this westernmost part of England. I sincerely hope that in other parts of the country "the general absence of the fungus disease" may be maintained, but here at Tehidy (I cannot speak as to other parts of Cornwall) the disease has appeared with us and spread rapidly. We have had exceptionally heavy crops throughout the season; early varieties, such as *May Queen*, *Sharpe's Express*, and *Ninetyfold*, grown in the walled gardens, have been lifted without showing a trace of disease. Other Potatoes growing in another part of the garden have fared differently. Until a month ago, the haulm of these looked remarkably green and vigorous, in spite of the dry weather. Then came a thunderstorm, but not a heavy rain, and on one or two nights a slight fog drifted inland from the sea, and within less than a week from that time all the foliage had dropped from the plants; in fact, the whole plots were blackened in less than 24 hours. We have now finished lifting from that part of the garden. Six varieties were grown here, and all were heavy crops. *Goldfinder* was almost free of diseased tubers, *Windsor Castle* produced about 15 per cent. of affected tubers, *Table Talk* and *Fidler's Eclipse* nearly 50 per cent., *White City*, which produced a wonderful crop, suffered about 40 per cent., and *Factor* about 30 per cent. We also plant rather more than an acre of ground on the downs, within a few hundred yards of the cliffs and fully exposed to the winds from the Atlantic Ocean. The plants here suffered in exactly the same way and

at the same time as those before mentioned. They are grown on a piece of ground that was broken up last year, and cropped for the first time with cereals. We had hoped for a yield of 10 tons here, but after examination in different parts of the field, it is doubtful whether we shall harvest 2 tons of clean tubers. And this in a dry season such as, I am told, no one now living remembers in Cornwall. What is the cause? Last summer was a wet one; the crops were not so heavy, but the losses from disease were insignificant. *F. J. Clark, Tehidy Gardens, Camborne.*

MODERN CUCUMBERS.—In a trial of Cucumbers conducted by the Royal Horticultural Society at Wisley Gardens this season, I was greatly surprised by the small differences seen in most of the varieties. But amongst the very numerous sorts I did not find the old *Blue Gown* variety, with its black-spined, deeply-coloured fruits, one of the best-flavoured of Cucumbers.

Raisers nowadays seem to be most concerned with the production of varieties having smooth and rather long fruits. There were many of this type in the trial, but the plants appeared exhausted after they had produced a couple of fruits and incapable of continuing the crop. No doubt some may argue that, if the fruits had been cut earlier, other fruits would have followed. This may be true; still, there were several varieties that had four, five, and even six fruits of a moderate size fully or nearly fully developed. Such free-cropping varieties have, for the ordinary grower, the greater value. The more prolific varieties were of the *Lockie's Perfection* type, with smooth, short "heels" and of a dark-green colour. If raisers desire to obtain free-fruited varieties with fruits of a better flavour and with flesh more crisp than characterises so many modern Cucumbers, let them obtain, if it may be had, a true stock of the old *Blue Gown*, and inter-cross it with *Rochford's*, which is one of the most free-fruited and useful varieties in cultivation. *Cucumis.*

THE WASP PLAGUE.—We are grateful for what the State has done during the past few years through the Board of Agriculture in giving us valuable information by means of the leaflets on diseases and pests affecting fruit and vegetable crops, and to the County Council for their lectures, which are useful and instructive so far as they go. But could they not go further, and do something to eradicate the wasps? I make bold to say that this pest is more destructive to fruit crops than all other insects, and the greatest enemy I have to contend against in fruit culture. The wasps have eaten or destroyed half the fruit crops here this season. I have tried all the known measures to cope with them. I have destroyed many nests with cyanide of potassium and by means of jars and bottles containing sweetened beer I have trapped thousands, yet they appear to be as plentiful as ever. I should like to draw public attention to the need there is to destroy the queen wasps in the spring, and I would suggest that the Board of Agriculture and the County Council be asked to do something to encourage the destruction of this pest. *Thos. Oldham, The Gardens, Stoughton Grange, Leicester.*

ADMISSION PRICES TO THE ROYAL INTERNATIONAL EXHIBITION, 1912.—As the chief horticultural journal representing the trade florists and nurserymen, also the head gardeners throughout the country, I urgently ask you to give publicity to this subject. This is an important matter to the thousands of members of the R.H.S. not by any means wealthy, who in a very large measure will be the actual producers of the exhibition. R.H.S. members should be admitted, as at the Temple Show, on production of their membership tickets. I feel sure that the R.H.S. secretary, Rev. W. Wilks, will explain matters fully, and that the committee that arranged this scheme will reconsider the same, and take all the members into their confidence, either by circular or by meeting. This should be done at once if assistance is to be expected from horticultural traders and others to make the 1912 exhibitions known all over the civilised world. It should be remembered that the object of the exhibition is, or should be, the furtherance of British horticulture, and the education of our young horticulturists, which has been lost sight of by the Royal Horticultural Society of late years. *W. H. Hudson (25 years member of R.H.S.), Goldhawk Road, London.*

THE FRUIT SEASON.—In our case much of the abundant bloom last spring was weak and small, and many of the fruits failed to set, although the weather at the time of blossoming was splendid. The failure is no doubt due to the unripened condition of the wood, due to the wet and sunless summer and autumn of last year. We had good average crops of Gooseberries, Strawberries, Raspberries and Red Currants. Pears are very few, but the Apple crop is satisfactory, the trees being splendidly fruited. The variety Charles Ross is especially fine, and others that are noteworthy include Peasegood's Nonesuch, Bramley's Seedling, Annie Elizabeth, Allington Pippin, Cox's Orange Pippin, Chelmsford Wonder, Wealthy, Christmas Pearmain, Cellini, Sturmer Pippin, Mère de Ménage, Lane's Prince Albert, Kentish Fillbasket and Potts's Seedling. We have plenty of Loganberries and Blackberries. *Frederick Legge, Fen Place Gardens, Turner's Hill, Sussex.*

LETTUCE HOLBORN STANDARD.—This is the finest Lettuce I have seen. The plants have withstood the hot, dry weather especially well, and produced good heads. They continued to grow steadily, making enormous hearts when all other kinds were bolting to seed. In a season which has proved a trial for all salad plants, this Lettuce furnished a plentiful supply of delicious leaves. *W. A. Cook, Leonardslee Gardens, Sussex.*

"MR. BRESSE" POTATO.—This is the modern way of spelling the name of this Potato, which was named after an American raiser. Turning to a list of varieties which I grew in 1875, I find the name is spelt "Breese," and sometimes with a "z" as Breeze. The emphasis was always on the syllables equally. The first variety to which the name of Bresse was attached was imported by Messrs. Hooper & Co., of Covent Garden, who at one time were the primary agents for disbursing this new trans-Atlantic race of Potatoes known as Breese's Prolific. This was a flattish, semi-round tuber, having a tinge of nut-brown on the skin. The variety now grown as Mr. "Breese" came to us later. But the spelling of the name with two e's and one s is the same as that by which it was put into commerce, as my spelling was derived from Messrs. Hooper's list. With Breese's Prolific I also grew in 1875 the then almost new Early Rose, Extra Early Vermont, Late Rose, Vermont Beauty, Willard's Seedling, Climax, also one of Mr. Bresse's raising, Compton's Surprise, and Gleason's Late. Snowflake, and some other popular, American varieties were introduced to commerce a year or two later. Of those mentioned only Early Rose seems to have survived. *A. D.*

LILY-OF-THE-VALLEY IN THE OPEN.—Some writers advise the planting of Convallaria majalis to be done in the autumn, but in the north, or in cold, wet soils, I found it was better to plant just as growth commenced, as then the plants grew without a check, whereas those planted to the autumn only made slow progress. The plant does not form roots until a considerable amount of top growth has been developed. I

have planted Lily-of-the-Valley even when the flowers were appearing with much better success than is obtained from autumn planting. Those I refer to were grown on a west border under Apple trees near to a north wall, where they received very little sunshine. But they did well under these conditions, and the crowns required replanting every four or five years. It was my practice to lift a portion of the bed annually, pick out the stronger roots and tie them in bundles of 25 ready for forcing in pots. The best of the crowns that remained were selected for planting out; they were placed 6 inches apart in trenches made 6 inches deep and 8 inches between the trenches, covering the roots with manure from a spent hot-bed previous to filling the trenches with soil. The surface was mulched annually with a layer, 3 or 4 inches thick, of the same material, but beyond this they received no further attention. *W. P. R.*

HELIANTHUS "MISS MELLISH."—Respecting the note on this plant by Mr. Brotherton in his calendar on the flower garden (see p. 168), it may interest readers to know that I have this year increased the beauty of the flowers of this Sunflower by removing all but the leading bud on each flower-stem. This leaves plenty flowers for effect, and the individual blossoms are much finer. *C. Lemesle Adams, Pendeford Hall, Wolverhampton.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 29.—*Present:* Mr. W. Botting Hemsley, F.R.S. (in the Chair); and Messrs. J. W. Odell, J. Fraser, W. Hales, J. O'Brien, R. Hooper Pearson and Gurney Wilson.

Wheatear Carnation.—Mr. CHITTENDEN sent an example of the well-known "wheatear" Carnation, which differed from the usual form, in having not only the continued repetition of the bracts, but above these, of the calyx. The first few whorls had the bracts arranged opposite to one another as usual; above these were some not so regularly arranged and occasionally connate below, while above, the leaves were in whorls of five and connate as the calyx is usually.

Narcissus fly in Habranthus.—Mr. CHITTENDEN also sent some bulbs of Habranthus pratensis received from Norwich, attacked by the grubs of the Narcissus fly, Merodon equestris. This insect appears to be extending its feeding habits to several other bulbs besides the Narcissus.

Adiada × "St. Fuscien."—This new bigeneric hybrid (Cochlioda Noezliana × Ada aurantiaca) was exhibited by Monsieur HENRI GRAIRE of St. Fuscien, Amiens.

Oak galls.—Mr. HALES showed specimens of the common Oak attacked by the Artichoke gall (Aphilotrix fecundatrix), the Oyster gall (Neuroterus ostreus), and the Spangle gall (Neuroterus numismatis). Mr. ODELL also showed shoots of Quercus coccinea, Q. Cerris, and Q. Robur, collected from trees growing near together, but whilst the two former species were healthy and green, the common Oak was badly galled with Neuroterus ostreus (Oyster gall), and the leaves were starved and browned.

Mints.—Mr. FRASER called attention to the many Mints in general use for culinary purposes, and submitted several specimens of different forms. Mentha spicata is the Mint for sauce as generally sold in the markets, whilst M. longifolia is the one generally found in private gardens. He had tested the various forms, and concluded that M. spicata was the best flavoured. Mr. ODELL said that he considered M. candicans the best.

Solanum nigrum.—Messrs. J. VEITCH & SONS showed a well-grown and fruited specimen of the Canadian Huckleberry.

British Orchid hybrid.—Mr. BOTTING HEMSLEY showed a figure of a British Orchid found on Reigate Hill in the third week of April last. It had three spurs, no pollen, and many other abnormalities. It was somewhat like Habenaria viridis, but the labellum rather more resembled that of an Orchis. It was apparently a hybrid, and too abnormal to connect with any British species, whilst its early flowering appeared unaccountable.

HORTICULTURAL TRADES' ASSOCIATION.

AUGUST 30, 31, SEPTEMBER 1.—It was a happy idea to hold the annual meeting of the Horticultural Trades Association of Great Britain and Ireland at Exeter, as Mr. P. C. M. Veitch, the head of the well-known Exeter firm, is president of the Association. The rendezvous was the Royal Clarence Hotel, and by Wednesday morning (August 30) some 60 members had reported themselves. The forenoon of that day was devoted to an inspection of the leading features of the city, the party being exceedingly fortunate in being conducted over the grand Cathedral by Canon Pryke. His lucid account of the development of the great building and his description of its leading architectural features were greatly appreciated. A luncheon, given by the President, followed, and this was attended by the Mayor and other city dignitaries, and the Archdeacon of Exeter and Canon Pryke.

The afternoon was devoted to visiting various nurseries. In those belonging to Messrs. Veitch & Son many interesting things were seen. The collection of trees and shrubs suited to the south of England, Ireland, and the west of Scotland is the most complete in Britain. In Messrs. Veitch's nursery an effort is made to produce in their own grounds everything necessary to the requirements of the nursery—they graft their own Rhododendrons, propagate Coniferae, bud Roses, work vines, &c. Nerines are a speciality, but, of course, were out of bloom. A few specialities in seeds attracted considerable attention. A house of Calceolaria "Golden Glory" was just past its best. Two new varieties of Calceolaria, not yet introduced, were carefully scrutinised—one a fairly tall, pure white, the other a dwarf red. The white variety is a gem. The dwarf deep rose-coloured Petunia "Lord Courtenay" was bedded out-of-doors, and growing under glass for seed. What must be one of the finest strains of single Asters in existence was observed; the flowers were large and the colours clear and bright. It was named elegans.

The other nurseries visited that day were those of Mr. W. Randall, where a good collection of trees and shrubs is grown, Mr. George Kerswill, and Messrs. Brown & Sons.

VISIT TO BICTON.

The second day, Thursday, was devoted to visiting Bicton, where Mr. Mayne, the gardener, conducted the party through the world-famous Pinetum. Here are to be found several Indian and Mexican species unrepresented elsewhere in Britain. Unfortunately many of the specimens are depreciating through the roots getting down into an unsuitable subsoil. Many years ago the older trees were mounded up, but nothing has recently been done in this direction. An avenue of 50 Araucarias was a striking feature. The trees were from 8 feet to 9 feet in circumference, 4 feet from the ground. They were planted in 1843. One of the 50 is hermaphrodite, the others being male and female almost alternately. Some of the most admired trees were found among the Cupressus, such as glauca, cashmeriana glauca, and Lambertiana. Pinus insignis, Abies cephalonica and A. magnifica were also remarkable specimens. In the gardens were many fine features. Magnolia grandiflora "Exmouth Variety" covered hundreds of feet of walls, the foliage was most luxuriant, and an odd flower still remained to suggest to visitors what glory and perfume there must be when hundreds upon hundreds of flowers respond to the early summer sun. The Macartney Rose charmed everybody, likewise did a long border of Belladonna Lily with Zephyranthes candida in front, both fully open in the blazing sun. The drive to Bicton and back occupied five hours, and it afforded the party a fine opportunity of comparing Devonshire crops and scenery with those of the respective districts to which the members belonged.

The third day was spent in sailing from Exmouth to Dartmouth, and up the Dart to Totnes.

Mr. Arthur W. Paul, of Messrs. W. Paul & Son, Waltham Cross, was elected President of the Association for the coming year, and Mr. Charles E. Pearson, Lowdham, Secretary. It is the intention of the Association to entertain the foreign nurserymen and seedsmen who visit this country on the occasion of the International Show next year. A vote of thanks was given to Mr. Veitch, who had worked hard to make the visit of the Association to Devon so successful.

CARLISLE AND CUMBERLAND HORTICULTURAL.

AUGUST 30, 31.—The fourth annual show of this association was held in the Market, Carlisle, on these dates. The number of entries constituted a record, being 1,366. The various classes numbered 245. The outstanding features of the show were the displays of hardy fruits and vegetables. Apples have seldom been shown at Carlisle in a better condition, and there was keen competition in all the classes for these fruits. Exhibits of Potatoes, Beetroot, Onions, Turnips, and Leeks were exceptionally good; many of the finest specimens were staged by allotment holders. Amongst flowers the displays of Sweet Peas and early-flowering Chrysanthemums were predominant. Cut perennials and annuals were also good.

The association endeavoured to make the show an educational centre, and, for this purpose, introduced several new features. During the two days Mr. W. B. Little, county horticultural lecturer, gave demonstrations in fruit bottling, and in the grafting, budding, and pruning of fruit trees, whilst Mr. J. Charlton gave a demonstration in the bedding and pruning of Roses. During the morning of the second day 1,100 of the elder children of the town and surrounding county schools visited the show, and to these special lectures were given by Mr. Little.

In the open classes the best exhibit of 18 vases of Sweet Peas, distinct, were shown by Mr. JOHN SMELLIE, Glasgow; 2nd, Mr. GEORGE BOWNESS, Glasgow.

The best exhibit of 20 cut Rose blooms was staged by Mr. J. HODGSON, Mount Annan.

In the class for Carnations or Picotees, the 1st prize was awarded to Messrs. GEO. FAIRBAIRN & SONS, Botcherby; 2nd, Messrs. M. CAMPBELL & SONS, High Blantyre. Early-flowering Chrysanthemums were best shown by Mr. J. SMELLIE; 2nd, Mr. GEO. BOWNESS, who excelled in the class for Cactus-flowered Dahlias, Mr. SMELLIE being placed 2nd.

Decorated dinner tables formed an attractive feature of the show. There were eight competitors, the 1st prize being awarded to Mr. A. HARWOOD, gardener, Netherby; Mr. A. KNIGHT, gardener, Brayton, being placed 2nd.

In the class open only to gentlemen's gardeners for nine vases of Sweet Peas, Mr. A. APPLETON, Farlow Hall Gardens, was awarded the 1st prize; 2nd, Mr. J. FARQUHARSON, Hayton Hall Gardens.

There was a class for 12 varieties of Sweet Peas open to all except nurserymen. The 1st prize was awarded to Mr. J. TURNER, Hutton-in-Forest; 2nd, Mr. J. HAY, Carlisle.

In the class for 12 vases, Mr. J. FLETCHER, Lanark, was placed 1st, and Mr. G. S. MOFFAT, Lockerbie, 2nd, whilst for nine vases Mr. FLETCHER again excelled.

FRUIT AND VEGETABLES.

The 1st prize for a collection of six dishes was awarded to Mr. A. HARWOOD; 2nd, Mr. RYAN, gardener, Warwick Hall.

Mr. T. FIXTER, Brackenburgh Tower Gardens, showed the best two bunches of Black Grapes; 2nd, Mr. A. MACKAY, Castlesteads Gardens. The best single bunch of black Grapes was shown by Mr. J. ROBERTSON, Knells, and the best bunch of white Grapes by Mr. T. FIXTER.

A silver cup, offered for a collection of outdoor fruits, was won by Mr. W. SCOTT; 2nd, Mr. C. C. ROWLAND, Mickleton, Gloucestershire.

The best exhibit of cooking Apples, packed and graded for market, was shown by Mr. J. MILLICAN, market gardener, Scotby.

In the two classes for collections of vegetables, the 1st prizes were won by Mr. C. C. ROWLAND and Mr. J. SMITH respectively.

In the amateurs' classes the challenge cup offered for Sweet Peas was won by Mr. J. BRYCE HARRINGTON.

Mr. H. S. THACKERAY won the silver medal offered in the class for six vases of Sweet Peas.

Vegetables, collections of six kinds, 1st, Mr. J. SMITH; 2nd, Mr. W. SAWYERS, Carlisle; 3rd, Mr. W. JOHNSTONE, Langholm.

Mr. J. VEITCH won the greenhouse offered by Mr. McLauchlin & Co., Stranraer, for the best display of cut flowers; 2nd, Mr. W. BATTYE.

NON-COMPETITIVE EXHIBITS.

Messrs. LITTLE & BALLANTYNE, Carlisle, exhibited a large collection of hardy plants and

shrubs, also many choice greenhouse plants. (Large Gold Medal.)

Messrs. GEO. FAIRBAIRN & SONS, Botcherby, Carlisle, staged floral designs, also a table of Sweet Peas and another consisting chiefly of Begonias. (Large Gold Medal.)

Messrs. ED. WEBB & SONS, Stourbridge, exhibited a stand of choice fruits, flowers, and vegetables. (Gold Medal.)

Mr. W. B. LITTLE arranged a stand of educational interest, which contained a large collection of Apples and bottled fruits from the Cumberland and Westmorland County Experimental fruit plots. (Gold Medal.)

Messrs. MANSELL & HATCHER, Leeds, staged a collection of Orchids. (Gold Medal.)

Mr. JOHN MILLICAN, Scotby, staged a large collection of Apples, the colour and finish of many of the varieties being remarkably good. (Gold Medal.)

Messrs. E. FAIRBAIRN & SONS, Edentown, displayed a large collection of hardy border flowers, comprising chiefly choice varieties of Phlox decussata. (Gold Medal.)

Sir BENJAMIN SCOTT (gr. Mr. Accleton) exhibited well-grown Orchids. (Gold Medal.)

Messrs. CLARK BROS. & Co., Carlisle, staged a miscellaneous collection of stove and greenhouse flowering and foliage plants. (Silver-gilt Medal.)

THE CHADWICK MEMORIAL SCHOOLS exhibited specimens of fruit, flowers, and vegetables grown by the boys. (Silver-gilt Medal.)

Silver Medals were awarded to Messrs. DOBBIE & Co., Edinburgh, for Dahlias; Mr. F. G. BELL, Whitley Bay, for Violas; Messrs. A. McLAUCHLIN & Co., Stranraer, and Messrs. J. H. REED & Son, Carlisle, for greenhouses and garden frames.

DUNDEE HORTICULTURAL.

AUGUST 31, SEPTEMBER 1, 2.—The annual floral fête of the above society was held on these dates in the Magdalene Park, Dundee. Despite the hot, dry summer, the show was an excellent one in every respect. The entries numbered 2,278, which is 169 in excess of last year. Out of the total entries, no fewer than 1,348 were from amateur artisans in the city and its immediate neighbourhood. Four large marquees were required to accommodate the exhibits. It is to be regretted that the weather was unfavourable on the opening day. A boisterous wind, increasing during the day to a severe gale, blew down the sides of two marquees, and it was feared, at one time, that the roofs would be lifted. Considerable damage was done to the exhibits on the side stages, and a magnificent display of Dahlias from Messrs. Dobbie and Co., Edinburgh, was completely destroyed. This exhibit, however, was soon replaced by fresh flowers. It is to be regretted that a more favourable site cannot be found for the show, for the present position is devoid of shelter. During the second and third days the weather was favourable, and we are glad to learn that last year's loss will be reduced. The show was noteworthy for the magnificent exhibits of fruit, Apples in particular.

The Corporation Cup, offered for six bunches of Grapes was won by Lord ROWALLAN, Kilmairs (gr. Mr. James Dixon). A bunch of Muscat of Alexandria in this exhibit was awarded eight points out of a possible ten. The 2nd prize was awarded to Mr. JAMES BEISANT, Castle-Huntly, who showed splendid bunches of the variety Duke of Buccleuch.

The principal class in the pot-plant section was for a group of plants staged on a ground space, 15 feet by 18 feet. Cut flowers and foliage were excluded by the conditions of the schedule. Only two exhibits were staged. Mr. JAMES BEATS, Binrock, was awarded the 1st prize for a group of Codiaums, Palms, and miscellaneous flowering and foliage subjects; 2nd, Mr. JAMES BETHEL, Grange, Monifieth, with an effective group of Palms, Codiaums, Liliums, Statics, Abutilons, and Bougainvillea glabra.

Mr. J. BETHEL was placed 1st for a table, 9 feet by 5 feet, of stove and greenhouse plants, arranged for effect, Mr. GEORGE REID, Inverton, West Ferry, being placed 2nd.

Exhibits of pot plants were excellent: in the class for six stove or greenhouse plants, Mr.

JAMES KINNEAR, Fernbrae, Dundee, was awarded the 1st prize and Mr. R. W. SAUNDERS, Lismore, Broughty Ferry, the 2nd prize.

The best four exotic Ferns were shown by Mr. G. REID.

Foliage plants were a great feature; in the leading class for these subjects, Mr. J. BEATS, Mr. J. KINNEAR, and Mr. R. W. SAUNDERS won the 1st, 2nd, and 3rd prizes respectively.

Chrysanthemums in pots were shown admirably, Mr. GEORGE SCOTT and Mr. J. BEATS being 1st and 2nd respectively in both classes.

Ferns were also well shown, and Mr. W. COOK, Duncraig, Mr. G. REID, and Mr. J. BETHEL were the most successful exhibitors.

For 70 Alpines in pots, the prize-winners were: 1st, Mr. W. T. MORRISON, Dundee; 2nd, Mr. R. BOISE, Dundee; and 3rd, Mr. V. L. GRAY.

CUT FLOWERS.

The classes in this section were well contested. Mr. G. SCOTT was placed 1st, and Mr. J. BEATS 2nd for a display of cut flowers in vases.

Hardy herbaceous flowers in 12 vases made a beautiful display. Mr. JOHN S. SUMMERS led, followed by Mr. CHAS. SHAW, Kippen.

For 12 H.P. Roses in not fewer than six varieties, Mr. JOHN SIMPSON, Panmure Gardens, Carnoustie, was placed 1st, and he also won the 1st prize for a similar number of Hybrid Tea Roses.

Sweet Peas were shown in grand style. In the class for 12 varieties in vases, one variety in each vase, Mr. G. MILNE, Burnside, Montrose, was easily 1st. He had splendid blooms of Mrs. H. Dickson, Masterpiece, Edrom Beauty, Sunproof Crimson, and Nubian, all the stems being of good length, with four flowers on each. Dr. SINCLAIR, Forfar, was placed 2nd.

In the amateur classes for cut flowers, Mr. JOHN IRELAND, Brechin; Mr. R. H. LOW, Dundee; and Mr. JOHN McLAREN, Dundee, won the principal prizes.

Miss ANDERSON, Dundee, showed the best hand bouquet, and Mr. J. BEATS the best bouquet comprised of hardy border flowers; also the best floral wreath.

NURSERYMEN'S CLASSES.

For 24 Roses, Hybrid Perpetual or Hybrid Teas, distinct, Messrs. J. COCKER & SONS, Aberdeen, were placed 1st with grand flowers. A bloom of J. B. Clark was particularly fine, and others of Lyon Rose and Frau Karl Druschki were almost perfect; Messrs. ADAM & CRAIG-MILL, Aberdeen, and Mr. WM. FERGUSON, Dunfermline, were placed 2nd and 3rd respectively. There was only one entry in the class for 24 Tea or Noisette Roses, Mr. W. FERGUSON, Dunfermline, staging good blooms and securing the 1st prize. For six vases of Roses, Messrs. COCKER & SONS, were again placed 1st.

VEGETABLES.

There was a strong competition in the class for a collection of 12 kinds of vegetables distinct. Mr. JAMES KINNEAR, Dundee, won the 1st prize easily, his Leeks, Celery, and Onions being especially fine. Mr. W. HARPER, Bankfoot, and Mr. V. DAVIS, Stanley, were placed 2nd and 3rd respectively.

Leeks, as usual at Dundee, were shown well, and for these Mr. J. KINNEAR was easily 1st. The same exhibitor also won the 1st prize for red-skinned Onions. 2nd, Mr. JOHN LAING, Blairgowrie; and 3rd, Mr. R. STAWARD, Panshanger Gardens, Hertford.

Potatoes made a fine show of well-grown tubers. In the principal class the prizewinners were: 1st, Mr. G. H. YOUNG; 2nd, Mr. W. PRATT, Kingskettle; and 3rd, Mr. W. GOODALL, Errol.

Carrots and Turnips were also strong classes, and Mr. W. HARPER excelled in both competitions.

FRUIT.

In the fruit classes the quality exceeded anything ever seen at Dundee. For a collection of Apples, in 12 distinct varieties, three of each, grown in the open, Mr. W. GRIEVE, Hazlewood, Broughty Ferry, was placed 1st; Mr. W. BENVIE, Muric Gardens, Carse of Gowrie, 2nd, and Mr. D. FERGUSON, 3rd. There was a large number of classes for dishes of various Apples and Pears. The amateurs,

in their section, excelled themselves, and their efforts made a good comparison with the professional exhibits. Mr. D. A. MILN, Linlathen, secured 1st prizes for Pears and Nectarines. The Dundee Corporation offered a cup for the best display of eight kinds of vegetables by an amateur. It was won by Mr. ALFRED DRUMMOND, Burnside Cottage, Crieff, for a most creditable exhibit; 2nd, Mr. PETER DONALDSON, Dunning Station; and 3rd, Mr. G. H. YOUNG, Meikle.

HONORARY EXHIBITS.

Messrs. SUTTON & SONS, Reading, put up a neat exhibit of Tomatoes, Onions, vegetables and Melons, the whole being pleasingly set off with cut flowers.

Messrs. DOBBIE & Co., Edinburgh, staged a large collection of Dahlias. Most of the flowers were shown in sprays and bunches.

Messrs. JOHN FORBES, LTD., Hawick, exhibited a small collection of herbaceous cut flowers, together with Violas, Carnations, and a few trusses of Zonal Pelargoniums.

Messrs. STORRIE & STORRIE, Glencarse, filled a table with excellent Apples in variety. They also showed a few pots of their strains of Petunias, Coleus, and Celosias.

Mr. D. MCCORNISH, Crieff, exhibited a collection of cut flowers including spikes of Gladiolus.

Messrs. W. P. LAIRD & SINCLAIR, LTD., Dundee, put up a large stand, in the centre of which there was an artificial pool of water. Rustic arches were tastefully displayed with Palms, Ferns, Spiræas, Liliums and foliage plants. This firm also showed floral designs.

Messrs. THYNE & SON, Dundee, showed Sweet Peas in variety, Pentstemons, Phloxes, Violas and Antirrhinums. A small table was reserved for each class, and the front of the exhibit was set off with a rockery filled with rock plants. The flowers were good, but the arrangement was somewhat stiff and formal.

Messrs. D. & W. CROLL, Dundee, showed Gladiolus, Begonias and Abutilons in variety. They also had a small collection of Apples.

THORNHILL HORTICULTURAL.

AUGUST 26.—The annual show of this Dumfriesshire society was held here on the above date. The exhibition proved equal to those of former years, and, as usual, a fine display of foliage and flowering plants was staged from the gardens of the Duke of Buccleuch, at Drumlanrig Castle (gr. Mr. David Inglis). In the cut-flower classes Sweet Peas and Carnations were specially good. The leading prize-winners in the open classes were: Mr. R. ROGERSON, Mr. JOHN MACAULAY, Mr. JAS. M. WYLIE, Mr. A. MCCREDIE, Mr. J. WALKER, Mr. T. McMECKING, Mr. JOHN WYLIE, Mr. R. BROOKS, Mr. J. McNAUGHT, and Mr. R. BROWN. In the amateurs' classes, Mr. D. BURNS, Tibbers, was awarded the Silver-gilt Medal offered for a group of cut flowers.

Obituary.

ALFRED COLE.—This well-known gardener died on August 22, in his 73rd year. He was the second son of the late William Cole, Fog Lane Nurseries, Withington, near Manchester. Deceased commenced his gardening career in his father's nurseries, and, after gaining further experience he was appointed gardener to the late Joseph Broome, Esq., Woodlawn, Didsbury, Manchester, who showed many important exhibits at the Manchester shows. When Mr. Broome removed to Sunny Hill, Llandudno, Mr. Cole continued in his service. He was an excellent plant grower, and took great interest in the collections at Sunny Hill, where wonderful success was achieved with plants in the open garden, notwithstanding its exposure to the sea winds.

ROBERT LAIRD.—We learn with deep regret of the death of Mr. Robert Laird, head of the firm of Messrs. R. B. Laird & Sons, Ltd., Edinburgh. Mr. Laird, who was 51 years of age, had not enjoyed good health for some considerable time, and, about the middle of August he undertook a visit to the Shetlands for the purpose of a holiday. He suffered a chill during the rough sea passage, and he returned to his home at Pink Hill, Edinburgh in an enfeebled

THE LATE ROBERT LAIRD.

condition. He became gradually worse, and passed away on the 2nd inst. Mr. Laird will be missed in Scottish horticultural circles, for he was officially connected with the leading Scottish gardening associations, including the Royal Caledonian Horticultural Society. Much of the success of the Scottish Horticultural Association is also due to his work as secretary during a period of ten years. It will be remembered that when he relinquished this office he was publicly presented with a piece of plate. He also took an active interest in the work of the Royal Scottish Arboricultural Society. Mr. Laird was a fine sportsman, and during his younger days was a prominent football player; more recently his favourite pastimes were golf and curling. He leaves a widow and six children.

FRED C. CHAPMAN.—Fred C. Chapman, florist, of Grand Rapids, U.S.A., and one of the oldest residents of Madison Square, died on August 17 at his home at the age of 75 years. He was born at Stamford, England, and emigrated to the United States in 1880, making his home at Grand Rapids. He retired from business about eight years ago. He is survived by a widow and one son.

JOHN ROBSON.—The death of Mr. John Robson, Nurseryman, Altrincham, Cheshire, occurred at Altrincham on the 31st ult.

JOHN BIRNIE.—The American horticultural papers record the sudden death on August 15 of Mr. John Birnie, a prominent New York florist, whilst attending the annual convention of the Society of American Florists at Baltimore. He was born at Buchan, Aberdeenshire, in 1853, and served his apprenticeship at Strachan House Gardens in that county. He emigrated to Canada early in his career, and subsequently resided at Buffalo, U.S.A., and Brooklyn. Later, he commenced business as a market nurseryman at Jersey City. After a period in that town he removed to Greenville and later to West Hoboken, where he was engaged in the florist's business at the time of his death. He was one of the most prominent florists of New Jersey. He made a speciality of Pelargoniums, Verbenas, bedding plants and Carnations for the New York markets, where he had a large and prosperous trade. He was a director of the New York Plant Growers' Association, a trustee of the New York Florists' Club, and one of the oldest members of the Society of American Florists. Mr. Birnie is survived by a widow, two sons and four daughters. His second son was engaged in business with him. Members of the New York Florists' Club and other florists' organizations attending the American Florists' convention, to the number of 85, followed the remains to the railway station, the interment being at West Hoboken.

WILLIAM B. MAY.—The *Florists' Exchange* records the death at Hartford, Connecticut, U.S.A., of Mr. William B. May, formerly a member of the garden staff at Kew. He was for 34 years gardener to James J. Goodwin, Esq., in the land of his adoption.

EDWARD McNALLY.—The death of Mr. Edward McNally, of Anchorage, U.S.A., a native of Dublin, Ireland, is announced in the American papers. Mr. McNally settled in America 45 years ago, and engaged in business as a florist at Anchorage. He is described as one of the best-known residents of Jefferson County.

JOSEPH R. FREEMAN.—Mr. Joseph R. Freeman, florist, of Washington, U.S.A., died at New York on the 22nd ult. Mr. Freeman was born in Yorkshire, England, 61 years ago. After serving an apprenticeship of nearly five years under the late Michael Saul, gardener to Lord Mowbray, of Stourton Park, he emigrated to Washington, where he found employment as greenhouse foreman at the establishment of the late John Saul, and remained there until September, 1872, when he became connected with the United States Agricultural Department, under the late Mr. W. H. Saunders, remaining two years. He was superintendent of the Oak Hill Cemetery, Washington, for some years, and later of Bonnie Brae Cemetery, Baltimore Co., leaving the latter place in 1880 to start in business in Washington. Mr. Freeman is survived by his wife, three sons, and one daughter.

OSCAR WATTECAMPS.—We regret to announce the death of this young and promising Belgian, who died at Ghent after a long illness contracted in the Dutch East Indies. M. Paul Lippens, who pronounced the funeral oration at the graveside, stated that there have been few more successful careers in the Dutch Indies than that of Oscar Wattecamps. He left Belgium about the middle of 1906 in the service of the Galang Exploitation Maatschappij. His energy, his capacity for organisation, and his botanical knowledge helped him rapidly to rise in the career of a planter. In February, 1910, he accepted the responsibility of Director of the Estates, and in the May of the same year he was appointed General Manager of the Galang Besar Rubber Plantations, Ltd.

DEBATING SOCIETY.

BRISTOL AND DISTRICT GARDENERS'.—A meeting of the members of this association was held on August 31, at St. John's Rooms; Mr. A. Perry occupied the chair. Mr. Shaddick, gardener to Colonel Goss, gave a lecture on "Ferns." In a list of varieties suitable for the decoration of dwelling rooms and greenhouses, the lecturer enumerated *Adiantum cuneatum*, *A. gracillimum*, *A. grandiceps*, *A. concinnum* and *A. Farleyense*; *Pteris cretica*, *P. cretica alba*, *P. argyrea*, and *P. serrulata*. The compost should consist of loam, leaf-soil, crushed charcoal and sand. For exhibition purposes the lecturer mentioned *Gymnogramme chrysophylla*, *G. argyrophylla*, *Davallia Mooreana*, *D. fijiensis*, *Microlepia hirta cristata* and *Nephrolepis* in variety.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 2, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Over the Kingdom as a whole the conditions were fair to fine, but in Scotland and the north of Ireland rain fell rather frequently. Thunderstorms occurred in various districts during the earlier days of the week.

The temperature was again above the average, the excess amounting to more than 5° in England E. The highest of the maxima were recorded on the 28th at most Scottish stations, on rather variable dates in Ireland, and on September 2 in nearly all parts of England. The values ranged from 90° in England E. (at Cromer and Hillington), 88° in the Midland Counties, 87° in England S.E., and 85° in England N.E. to 70° in Scotland W., and to 68° in Scotland N. At Greenwich Observatory the maximum on September 2 was as high as 89°, and at Camden Square 90°. The lowest of the minima varied from 34° in England S.E. (at Marlborough) and 37° in Scotland E. to 45° in England N.E. and N.W., and to 54° in the English Channel. The lowest grass readings were 30° at Crathes on August 30, and 28° at Llangammarch Wells on the 31st. At several stations the thermometer remained above 40°, and at Southend-on-Sea the minimum was 50°.

The mean temperature of the sea.—At all stations except Lerwick and Newquay the water was warmer than during the corresponding week of last year, the difference at Margate and Lamlash being as much as 6°. The means for the week ranged from 68° at Margate, above 66° at the Shipwash Lightship and Eastbourne, and 63° at Plymouth to 54° at Burnmouth, and to 54° at Lerwick.

The rainfall was more than the average in Scotland N. and W., but less elsewhere. In England E. the fall was less than 0.1 inch. Large quantities were experienced in some Scottish districts about the middle or towards the end of the week. At Glencarron there was 1.27 inch on August 31, and 1.30 inch on September 1, and at Fort William 1.84 inch on the 31st. Rather more than 1.0 inch fell at Portlough and Rotheray on the 31st. A thunderstorm at Aberdovey yielded 1.14 inch of rain on the 27th.

The bright sunshine exceeded the normal in all districts, the excess being very uniform. The percentage of the possible duration ranged from 65 in the English Channel, and 60 in England S.E. to 41 in Ireland N. and Scotland E., and to 40 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending September 6.

The ninth warm and dry week in succession.—The day temperatures during the past week were higher than in either of the two previous weeks, and on the hottest day the highest reading in the thermometer screen was 88°. On the other hand, on two nights the exposed thermometer fell respectively to within 7° and 3° of the freezing point. The ground is now as much as 5° warmer than is seasonable, both at 1 and 2 feet deep. Rain fell on two days, but to the total depth of less than a tenth of an inch. Since the end of June, or in the last 10 weeks, only 1½ inch of rain has fallen, two-thirds of which small amount was deposited on four days. This is the ninth week since there was any percolation at all through either of the soil gauges. The sun shone on an average for 8½ hours a day, or for three hours a day longer than is usual at the beginning of the Autumn. On two days the sun shone for 11 hours, which is a very unusual duration of bright sunshine for September. Light airs and calms have alone prevailed during the week, and the direction of these light airs were very variable. The mean amount of moisture in the air at 3 o'clock in the afternoon fell short of a seasonable quantity for that hour by as much as 24 per cent. On two days the difference between the readings of an ordinary thermometer and one with its bulb kept constantly moist amounted, at 3 p.m., to respectively 21° and 20°.

AUGUST.

Extraordinarily hot and dry.—This was the hottest August I have yet recorded here, that is to say, in the past 25 years. The day temperatures were on an average nearly 8° warmer, and the night 3½° warmer than their respective means for the same 25 years, and higher than in any August of the same period. On 11 days the highest reading in the thermometer screen exceeded 80°, on five days 85°, on three days 90°, and on the hottest day of all reached 96°, which is the highest shade temperature yet recorded here at any period of the year. On the coldest night the exposed thermometer fell to 39°, which is with two exceptions the highest extreme minimum temperature yet recorded here in August. Rain fell on only 11 days, to the total depth of less than three-quarters of an inch, which is just a quarter of the average rainfall for the month. In the past 55 years there has been only one drier August in Berkhamsted, and that was in 1880. The sun shone on an average for 7½ hours a day, which is 1½ hour a day in excess of the August average. There have been, in the last 25 years, only four other Augusts with a greater duration of bright sunshine. The winds were as a rule very light. In no hour did the mean velocity exceed 12 miles; direction south. There have been only three calmer Augusts in the twenty-five years. The atmosphere remained remarkably dry, the mean amount of moisture in the air at 3 p.m., being 11 per cent. below a seasonable quantity for that hour. Not for 24 years has the air been so dry in August.

THE SUMMER.

Extraordinarily hot, dry, and sunny.—June was moderately warm, while July and August taken together were extraordinarily hot. In my own records for the past 26 summers this summer comes out as the hottest of them all. On the warmest day the temperature in the thermometer screen rose to 96°—the highest reading ever recorded here, and on the coldest night the exposed thermometer registered 5° of frost, which on the other hand is, with two exceptions, the lowest extreme minimum indicated here by that thermometer in any previous summer. The total rainfall only amounted to 3½ inches, which is not much more than half the average quantity for the three summer months. Of that amount 2½ inches was deposited in June, leaving only 1½ inch for July and August. This was the driest summer since 1887, or for 24 years. The sun shone on an average for eight hours a day—making this the brightest summer of which I have here any record. E. M., Berkhamsted, September 6, 1911.

ADDRESS: Coalite. The address of the firm which manufactures the fuel known as Coalite is 3, London Wall Buildings, London.

AERIAL OR STEM TUBERS OF POTATOS: A. M., New Barnet. The specimens of stem tubers of Potatos are interesting, but not uncommon. Examples were illustrated in the *Gardeners' Chronicle* as long ago as November 1, 1873. The tuber being a modified bud, it is not surprising to find that tubers are sometimes produced as axillary outgrowths on the stem.

CARNATION ATTACKED BY INSECT PEST: L. J. G., Bucks. Spray the plants with liver of sulphur every third day at the strength of 1 ounce in 3 gallons of water.

FERNS: H. P. There is no disease present in your Ferns; the damage is due to scorching by sunshine whilst they were wet.

GRAPES: R. H., Frodsham. The berries have been scorched by the sun whilst they were damp. Ventilate the house early in the day to allow the fruit to become dry before the sun-rays become powerful.

INSECT: H. Fox. The large "fly" you send is *Sirex gigas*, the wood-wasp (see fig. 94). The female insect is very destructive to Coniferous trees, piercing through the bark and depositing her eggs in the wood by means of an ovipositor. The wood-wasp is like a hornet in appearance, but has no power to sting.

FIG. 94.—SIREX GIGAS: THE WOOD-WASP.

IVY: W. C., Ravenscourt Park. There is no disease present in the Ivy leaves; the injury has been caused by drip.

NAMES OF FRUITS: N. Tost. Gooseberry Apple; R. S. Quarry; Dumelow's Seedling.—J. MacD., Stirling. 1, Pond's Seedling; 2, Yellow Magnum Bonum; 3, Mitchelson's; 4, Kirke's.—P. R. 1, Northern Dumpling; 2, French Crab; 3, not recognised; 4, Yorkshire Beauty; 5 and 7, Ribston Pippin; 6, Yorkshire Greening.—W. Cooper. Harvey's Wiltshire Defiance.—A. W. D. Your labels were all detached; send again with the numbers fastened more securely.—F. A. D. 1 and 2, Lane's Prince Albert; 3, not recognised; 4 and 5, Lord Derby; 6, Cox's Pomona. F. 1, Purple Gage; 2, Prince of Wales; 3, Prince Englebert; 4, Denniston's Superb; 5, Blue Prolific; 6, Belgian Purple.—W. Tayler. Duchess of Oldenburg.

NAMES OF PLANTS: T. Euphorbia Lathyris.—A. J. C. 1, Achillea millefolium; 2, Hibiscus syriacus.—A. B. C. 1, Juniperus chinensis aurea; 2, Thuja occidentalis aurea; 3, Juniperus chinensis; 4, Cupressus pisifera squarrosa; 5 and 6, C. Lawsoniana vars.; 7, Scutellaria galericulata; 8, Angelica sylvestris; 9, Pulicaria dysenterica; 10, Valeriana officinalis; 11, Sequoia gigantea.—S. H., Queen's Co. Hibiscus syriacus.—Cerus. 1, Bignonia radicans; 2, Podocarpus chilina.—F. W. T. Lonicera sempervirens.—F. B. 1, Populus canescens; 2, P. alba; 3, Pyrus Aucuparia; 4, Cotoneaster frigida; 5, Ptelea trifoliata; 6,

Acer dasycarpum.—R. E. Head. Lathyrus sativus.—G. T. W. 1, Statice eximia superba; 2, S. latifolia.—J. M. D., Stirling. 1, Agave gemiflora; 2, (the small tufted plant), Opheopogon japonica.—W. & S. Aster Amellus.—A. R. 1, Oncidium flexuosum; 2, Satyrium membranaceum; 3, Polystachya ottoniana.—H. T. 1, Davallia pentaphylla; 2, Davallia ornata.—W. B. 1, Dracena amabile; 2, Dracena ornata; 3, Saponaria officinalis flore pleno; 4, Chenopodium purpurascens.—G. C. Cassine fulvida, often known in gardens as Diplopappus chrysophyllus.—F. J. S. Hibiscus syriacus.—B. & S. Glyceria aquatica.—Anxious. 1, Rudbeckia laciniata; 2, Helonium autumnale; 3, H. a. var. pumilum.—E. K. 1, Indigofera hebeptala; 2, actinidia chinensis.—E. C. Codiaums (Crotons): 1, Souvenir de Thos. Rochford; 2, Flambeau; 3, Laingii; 4, Princess of Wales; 5, Countess Surperba; 6, Mortii; 7, Etna; 8, Aigburthen-sis; 9, Aneituenensis; 10, Emperor Alexander III.; 11, Andreanus; 12, Queen Victoria; 13, nobilis.

ORCHID LEAVES WITH MARKINGS: F. V. T. The injury to the Orchid foliage is caused by the fungus known as Thielavia basicola. Sponge the leaves on alternate days with a solution of soft soap, adding 1 ounce of liver of sulphur dissolved in 3 gallons of water.

PELAGONIUMS AS STANDARDS: F. S. Zonal Pelargoniums make excellent decorative standard plants. Varieties should be chosen that are known to flower freely, and it may be taken as a rule that those which are best suited for winter flowering are best for training in this form. Select the best of the stock that has been used during the preceding winter as dwarf, bushy plants. In nearly every instance a strong shoot will be found to be pushing forth from the base of the plant, and this should be retained, gradually removing all other growths. This shoot will grow away freely, and in a season form a strong, main stem. A batch of plants should be treated in this manner every year to provide fresh stock. The scented-leaved Pelargoniums make excellent standard plants, and large specimens may be seen at Gunnersbury House, Acton. The largest of these are 7 feet in height, and 3 feet through the head, being sixteen years old. Both P. capitatum, the rose-scented variety, and P. Radula major need no pruning, merely training the shoots in their places by tying. P. Clorinda is a scented-leaved variety, producing handsome, pink flowers. Plants of this variety need to be renewed every year or two, so that it is necessary to propagate fresh stock each season. P. Ardens, a small-flowered, scarlet Pelargonium, is also very pretty grown as a standard.

POPLAR TREE WITH THREE HOLES: Poplar, Rothshire. The holes have most probably been made by the larvæ of some boring insect, such as the wood-leopard moth. A piece of stiff wire inserted in the holes will most probably kill the larvæ.

SURPLUS FLOWERS FOR MARKET: A. H. P. If the flowers you name are well grown, and properly bunched and packed, there should be no difficulty in disposing of them to a salesman in Covent Garden Market. The amount they will realise will depend upon the quality, the supply, and the demand when they are ready for sale. Gypsophila elegans does not travel well except when packed upright in baskets, so that the inflorescences are not crushed. This flower is usually sent by the growers in vans, seldom by rail.

TOMATO FOLIAGE: Puzzled. The succulent, fleshy condition of the Tomato leaves is such as is often seen after the use of a fungicide containing a copper salt; they are free from fungous disease. If copper has not been used, then the cause must be looked for in some error of culture.

THE LILY SEASON IN SCOTLAND.

THOUGH Oriental and American Lilies have, as a general rule, flowered admirably this year, their growth, in the earlier stages of their development, was seriously affected by the long absence of rain. The great Himalayan Lily (*Lilium giganteum*), for example, did not attain in my garden to anything approximating to its normal height, though it seems to have been more successful at Monreith, in this county, where, as Sir Herbert Maxwell has recorded in these columns, it reached an elevation of from 7 feet to 8 feet. But there is always, in such cases, some cultural consolation. In my own garden, whilst its flowering stem was by no means imposing, it made amends in the remarkable dimensions and luminousness of its ivory-white, violet-tinted flowers, which were, without exception, the largest I have seen. The grandest specimen of *L. giganteum* that has come

under my notice this year was shown to me recently by the Viscountess Dalrymple, an ardent horticulturist, in her ladyship's interesting "wild garden" at Lochinch Castle. It was fully 10 feet high, and had 15 magnificent flowers. The quantity of seed its great capsules at present so firmly enclose must be enormous.

L. monadelphum Szovitzianum, growing in a comparatively shady portion of my garden, in congenial clay, was little less in stature than it has been in former years. But the slight difference in height was somewhat in its favour, from an artistic point of view, for it has frequently ascended to such an elevation that its lemon-coloured flowers, enfolded by the leaves of a venerable Apple tree, were sometimes passed by without notice.

L. Henryi, with its rich, orange-coloured blossoms, by reason of its reliability and splendid effectiveness, is one of my most precious possessions. Planted in ordinary garden loam, slightly enriched with an admixture of leaf-mould, it has flowered in the same situation for at least 13 years, and no season, however exacting, seems to affect it very much. I have been greatly charmed by the reappearance in my garden of that veritable gem, *L. japonicum* [Kramer], introduced from the mountain regions of Japan by the late Dr. Wallace, of Colchester. Replanted two years ago in what I deemed a favourable situation, in a fibrous, peaty soil, I imagined, when it failed to show itself last season, that it must have died; but, as Lord Beaconsfield once observed, "it is the unexpected that happens," and such has been my experience with this lovely Lily. It is the subject of a coloured plate in Mr. Grove's highly-interesting and instructive book on Lilies (Present-day Gardening series), which I had the pleasure of perusing about a fortnight ago in Logan House.

L. Washingtonianum, after flowering with graceful effect for many seasons, has died out with me, which I greatly regret, for its refined aspect, combined with its delicate fragrance, make it by far the most fascinating of American Lilies. Of the varieties of *L. auratum*, my supreme favourite is *virginale*, an almost white derivative from *A. platyphyllum*. It is quite as reliable and enduring as its parent, and its flowers, though by no means numerous, are very handsome. I ought to record that my nearest neighbour, Mr. John Hill, who is at once a mechanic, a poet, and an earnest amateur horticulturist, has some very fine specimens of *Lilium auratum platyphyllum* in his garden this year. I recommend to him a trial of the most distinctive of this invaluable family, viz., *rubro-vittatum*.

Of the varieties of *L. longiflorum*, those that succeed best in southern Scotland are *Wilsonii* and *giganteum*, of which the latter vigorous variety has doubtless received its name from the dimensions of its long and lustrous blooms. Of *L. speciosum*, which combines refinement of form with exquisite fragrance, the most promising

varieties this season are *roseum*, *Melpomene*, and *Kraetzeri*, of which the last-mentioned is especially beautiful, with its finely-reflexed, green-banded, snow-white flowers.

It is somewhat unfortunate that such highly-attractive Asiatic Lilies as *L. nepalense*, *L. Lowii* and *L. Wallichianum* are not adapted for garden cultivation for they are grandly effective when grown in a conservatory. David R. Williamson, *Manse of Kirkmaiden, Wigtownshire*.

THE ROSARY.

HYBRID RUGOSA ROSES.

THE notes on The Pruning of Roses by *White Rose* (see vol. xlix., p. 129) is one of extreme interest, if only for the reference it contains to the Rugosa section of Roses. I am somewhat astonished at the neglect by British nurserymen of such a charming Rose as *Conrad Ferdinand Meyer*, and the very meagre descriptions to be found in catalogues. I know of only one grower who devotes a few lines in his list to this Rose, and he admits that it is one of the finest acquisitions to the Rose family. I am often puzzled at this apparent neglect on the part of our nurserymen of this splendid Rose, and cannot find any circumstance to account for it. In nearly all catalogues we find this variety listed among the ordinary Rugosas, which is most misleading, for it is really a hybrid of outstanding merit and importance, and to the ordinary amateur grower its inclusion in this list conveys nothing whatever of its exquisite beauty and total difference from others of the section. It was raised by the eminent German botanist, Dr. Müller, from a cross between a seedling variety from *Gloire de Dijon* crossed with *Duc de Rohan*, and the Rugosa variety named *Germanica*. Traces of this parentage are readily noted in the growth and habit of *Conrad F. Meyer*, and it is a splendid Rose with very fragrant imperial pink blossoms of the finest form, making an outstanding object in gardens.

The variety seems to possess every desirable virtue among Roses; it is easily grown and thrives in almost all soils; its wood is almost frost-proof, and it is a Rose which, in Scotland at least, resists mildew. It yields a wealth of blossoms from early June till late October, and, grown as a standard, it is superb. The time is not far distant, I think, when we may look for a hybrid Rugosa section in all good catalogues, for just as *Pernet Ducher* has given us a new race of *Pernetiana* Roses, Dr. Müller has initiated a race of hybrid Rugosas which will prove of the greatest importance and value in gardens. Several new sorts are now in commerce, but it is too early to write of their merits, but mention may be made of the white sport from *Conrad F. Meyer*, named *Nova Zembla*, one of the sweetest of white-flowered varieties. The new yellow hybrid Rugosa *Daniel Lesueur* mentioned by *White Rose*, and which he judges to be very nearly related to the *Dijon Teas*, was put into commerce in 1909, and I can only find it mentioned in one British catalogue; this also is one of Dr. Müller's hybrids. I was only able to procure plants of this Rose last autumn, and I am very anxious to see it in flower, but I cannot agree with your correspondent as to its being related to the *Dijon Teas*. Certainly nothing in the appearance of the wood and habit of growth suggests this contention, and a consideration of the parentage dispels any doubt on the point. A seedling from *Pierre Notting* and *Safrano* crossed with *R. rugosa Germanica* gave *Daniel Lesueur*, and there is surely no trace of *Dijon*

Tea in that cross. If this new yellow Rose is anything like its progenitors, what a noble trio we shall possess with Conrad F. Meyer, Nova Zembla, and Daniel Lesueur. Fragrance will certainly be one of the most outstanding features of these Hybrid Rugosa Roses, and in Gravereaux's variety of 1904, named Rose à Parfum de l'Hay (R. Damascena × General Jacqueminot × R. Germanica), we have a brilliant red flower of unusually powerful perfume. —George M. Taylor, Mid-Lothian.

ROSA HEMISPHERICA.

I HAVE been much interested in the discussion as to this Rose (see vol. XLIX., p. 418 and vol. L., p. 92), and have considerable sympathy with Mr. G. M. Taylor's object in collecting yellow Roses.

I think there has been general agreement since Lindley's time that R. sulphurea of Aiton is the same as Hermann's R. hemisphærica. First, as to the date of its cultivation, the following quotation from Parson's (New York, 1847) may be of interest. R. sulphurea, Ait., "is one of the oldest inhabitants of our gardens, though the exact year of its introduction is unknown. Ludovico Berthema tells us in 1503 that he saw great quantities of yellow Roses at Calicut, whence it appears probable that both the single and double-flowered varieties were brought into Europe by the Turks. Parkinson tells us "... that the double yellow Rose was first procured to be brought into England by Master Nicholas Lete, a worthy merchant of London and a great lover of flowers from Constantinople, which, as we hear, was first brought thither from Syria, but perished quickly with him, and with all others to whom he imparted it; yet afterwards it was sent to Master John de Frangueville, a merchant of London and a great lover of all Rose plants, as well as flowers from which is showing the greatest store that is now flourishing in this kingdom."

It is clearly the same Rose as that described by Parkinson in his *Paradisus* (1629) as Redulea mutiplex, the double yellow Rose. He notes the difficulty in getting it to open, and that it was "very tender with us here about London." Hermann, who wrote his "De Rosie" in 1762, described it under the name hemisphærica. Lindley (1820) who treated Aiton's sulphurea and Hermann's hemisphærica as identical, calls it by far the most splendid of the genus, and says that it has never been heard of in a single state nor even near it. He notices the difficulty in making the Rose expand, and that Sir Joseph Banks had it growing and flowering in the greatest luxuriance when planted in the soil of a marsh.

This Rose seems to have formed a subject of discussion in the first vol. of the *Gardeners' Chronicle* (see p. 811), from which it would appear to have proved most successful when grown on an east aspect, next on a north, and then on a west aspect, only one success has been recorded on a south aspect. Jamain and Founey (Paris, 1873) note, evidently with some surprise, that though this Rose does better on a moist than a dry soil, it succeeds fairly well in France and Germany, but seldom in England. Mr. Wm. Paul in *The Rose Garden* (9th edition, 1888), has a long discussion on the subject, and says he has never heard of it flowering near London or in the immediate neighbourhood of any large manufacturing town. He mentions Ballater and Edinburgh in Scotland, and a house in Enfield Chase, where it was planted on a N.E. aspect, as places where the Rose has succeeded.

Regel (1877) calls Persian yellow a garden form of this Rose; it is certainly a far easier Rose to persuade to do well in England, though, as Mr. Paul says, it is "not of equal beauty" with R. hemisphærica. It is clear the cultivation of this Rose has long formed a subject of discussion for English gardeners, and seems to be one of those difficult subjects for English

gardeners, requiring a cool, moist atmosphere, with plenty of sun, plenty of water, and perhaps free drainage, and one may further suspect that its requirements might be more easily met in Scotland than England.

To turn to the other subject, R. pimpinellifolia lutea has long interested me. I have noticed considerable variation in the depth of yellow in the petals in different plants of this variety, and, I fancy, in the same plant in different years. I wonder if Mr. G. M. Taylor has noticed the specimens at Kew. A few years ago I was greatly struck with the deep colour of some of these plants, which, as I then saw them, was almost as deep as Persian yellow. With me R. pimpinellifolia lutea is perhaps scarcely so tall a grower as either R. hispida or R. xanthina, but I fancy I have seen it equalling both these Roses in size. *White Rose*.

BRITISH ASSOCIATION.

BACTERIAL DISEASES OF PLANTS.

THAT bacterial diseases of plants are beginning in this country to attract the attention they deserve was evidenced by the discussion at the meeting of the Agricultural Sub-section of the British Association at Portsmouth, on the 1st inst. The first contribution was a useful summary of our present knowledge of this subject, given by Prof. M. C. Potter. It is only of recent years that the existence of bacterial diseases in plants has been generally acknowledged. As the result, however, of the evidence afforded by very many inoculation experiments, the earlier scepticism has given way, and there are now many investigators in this, as well as other countries engaged in this line of research. Although any strict classification at present is impossible, there are

FIG. 95.—PLUM "BLACKBIRD": A DESSERT VARIETY.
(Received R.H.S. Award of Merit on the 29th ult., when shown by Messrs. Laxton Bros.)

TWO NEW PLUMS.

At the meeting of the Royal Horticultural Society on the 29th ult., Messrs. Laxton Bros., Bedford, exhibited several seedling Plums. The variety Blackbird (see fig. 95) was recommended an Award of Merit by the Fruit and Vegetable Committee. It was raised from The Czar × Curlew. The fruit is of a medium size and has a purple skin; the flesh is very pleasant and the variety should prove a useful addition to dessert Plums. Prosperity (see fig. 96) is also a purple-skinned fruit, the flesh being yellow. The parents of this variety were Grand Duke and The Czar. The Committee was favourably impressed with this culinary variety, and appointed a small sub-committee to report on the habit and cropping qualities of the tree, but, as the crop has since been gathered, the inspection must take place next season.

certain well-marked types of bacterial disease. A large number fall under the head of the soft rots, of which the white rot of Turnip may be taken as typical. Pure cultures may be obtained of this bacillus, inoculations from which on perfectly sound roots produce the characteristic symptoms of the disease in about 12 hours.

The bacilli secrete an enzyme which rapidly dissolves the middle lamella of the cell wall and causes the swelling and softening of the cellulose. They then crowd along the inter-cellular spaces, at the same time producing a toxin which destroys the protoplasm. With the death of the protoplasm the cell sap escapes, affording additional nutriment for the bacteria.

In this way the decay spreads from the point of infection through the root, until at the end of a few days the greater part of the root is reduced to a greyish soft mass.

Entry can take place through the epidermis of young plants that have not yet developed a cuticle, but only through a wound in the older parts. Another group of bacterial diseases is the black rots, e.g., the black rot of the Cruciferae (*Pseudomonas campestris*). In the early stages, the attack is confined to the vascular bundles, the vessels of the xylem becoming crowded with bacteria and black or dark brown in colour. The rot then extends along the medullary rays, giving a characteristic radial structure, and only comparatively late into the parenchyma. Finally, therefore, the whole flesh becomes discoloured, although externally the root may appear quite sound. In the black rots no conspicuous swelling of the wall takes place, so that the tissues do not become broken down into a soft mass.

Rather similar to the above are the bundle rots. The xylem vessels are again the elements primarily attacked, the soluble carbohydrates, &c., which they contain constituting a favourable medium for the growth of the bacteria. The vessels eventually become so blocked with the mucilaginous mass of bacteria that the

has been suggested that this resemblance is more than merely superficial, and may throw light on this difficult problem of animal pathology.

The disease known as fire-blight (*Bacillus amylovorus*) is of historic interest, as being the first plant disease referred to a bacterial agency (Burrill 1881). As in the fungi, the relations between host and parasite depend greatly on external conditions—a lowering of the vitality of the host by bad cultural conditions, excess of nitrogenous manure, &c., predisposing to rot. Infection would seem to take place through stomata, nectaries, or wounds, dispersion occurring readily through the xylem vessels. Insects, slugs, &c., no doubt carry pathogenic germs, and by their bites enable these parasites to gain an entrance into the host in a manner parallel to the carriage of Malaria by mosquitos.

Mr. F. T. Brooks contributed a paper on "Bacterial Gum Diseases." There would seem to be no doubt that some of the "gum diseases" attacking many plants are bacterial in nature. Thus Erwin F. Smith (1904), working in America, proved conclusively by means of in-

attacked ever recovers. The production of gum, which is such a conspicuous accompaniment of the disease, is almost certainly due to a transformation of certain of the sugars. Thus the bacterium would not grow at all on pure cellulose: growth took place, but no gum was produced when glucose was used as a medium, while in the case of cane sugar growth and much gumming occurred.

The mosaic disease of the Tobacco plant occurs in almost every region where Tobacco is cultivated. It was formally attributed by Mayer and Iwanowski to bacterial agency, but more recent work by Hunger and others points rather to the conclusion that the disease is due to some physiological disturbance within the plant.

A BACTERIAL DISEASE OF THE POTATO PLANT IN IRELAND.

At a meeting of the Agricultural Section of the British Association, Mr. G. H. Pettybridge, Economic Botanist to the Department of Agriculture and Technical Instruction for Ireland, gave an account of a disease of the Potato plant (including tubers) in Ireland, of which no detailed account has been published.

The existence of one or more bacterial diseases of the Potato in Ireland has been assumed for the past eight or nine years, but the matter has not been closely investigated. Early in the present century, Delacroix investigated a bacterial disease of the Potato in France, which caused yellowing of the foliage, and, eventually, disease of the tubers. Microscopic examination showed a development of gummy matter in the wood vessels, and the presence of a bacterium which was thought to resemble the *Bacillus solanacearum* of F. E. Smith in America.

From an examination of material sent from Ireland, the author judged the disease to be prevalent in that country also.

In a late paper, Delacroix identified "brunisure" (browning) of the Potato as due to the same organism, which was thought to infest the plant from the soil. Later work by Johnson in Ireland suggested that other organisms pathogenic to the Potato occurred, and in 1906 he recorded *B. phytophorus*, as a general cause of "yellow blight," "black leg," and "Potato tuber rot" in Ireland.

It was in order to clear up uncertainty on this point, and to obtain information as to the nature and cause of what appeared to be a fairly widespread disease of the Potato that the investigation described below was undertaken.

It was first determined that "yellowing" or "yellow blight" of the Potato was not a disease due to bacterial or fungal action, but a pathological condition induced by unfavourable conditions. Black stalk rot, the name suggested by the authors for the disease, also known as "black leg," or "schwarzbeinigkeit" in Germany, has been proved to be of bacterial origin. The organism causing it has been isolated and grown in cultures, from which fresh infections have been readily produced.

The symptoms previously had often been confused with those caused by the fungus *Sclerotinia sclerotiorum*, in the so-called stalk disease. Black stalk rot usually appears early in the season, often as early as the second week in June. Affected plants are stunted in growth, the foliage becomes pale green or yellow, and ultimately wilts. Individual stalks are easily removed from the soil, owing to the damaged condition of the roots, and the stalk becomes blackened and rotten at or below the ground-level—a condition which may spread later to the upper branches. Diseased stems, split longitudinally, show that the softer tissues have become soft and blackened, and there is usually a sharp line of demarcation between the diseased and healthy tissues. In section, the vascular tissues are seen to be deeply discoloured, and the stem cuts toughly.

Yellowish-brown gummy material occurs in

FIG. 96.—PLUM PROSPERITY (GRAND DUKE X CZAR).

supply of water is cut off, and, as a consequence, the shoot wilts above the point of attack.

This sudden wilting of the foliage is one of the first symptoms of the disease; subsequently the whole plant shrivels and turns black.

To this class belong the Potato and Tomato disease (*B. solanacearum*); black-leg, the black stalk rot, &c. The tumorous diseases found in many plants form a special class; several have been traced to a bacterial origin. This is the case with the tuberculosis (rogn) of the vine, the tumour of the Olive and the Crown Gall. The tumours of other trees are probably also due to a bacterial cause. The excessive enlargement of individual cells characteristic of the swellings produced by *Plasmodiophora* and of those formed by *Azobacter* and *Urophlyctis* on the Leguminosae is not found in these tumours. The cells, on the contrary, are usually smaller than the normal, due, no doubt, to stimulus to rapid cell division. A characteristic feature of these tumorous growths is their capacity for spreading through healthy tissues by means of branches or "fingers" which actually grow through the tissues of the host, recalling the spread of malignant growths in animals. It

oculation experiments that the gum disease of the sugar cane in Australia, previously described (in 1893) by Cobb, is caused by a specific bacterium which he named *Pseudomonas vascularum*. Similarly Aderhold and Ruhland have recently proved that a disease of Cherry trees in Germany is caused by a bacterium which they name *Bacillus spongiosus*. The symptoms are similar to those exhibited by Pear trees attacked by Pear blight, which is also a bacterial disease. It was found possible to isolate *B. spongiosus* from the masses of gum and to grow the organism in pure culture: inoculation experiments clearly showed that the bacterium was the cause of the disease.

This organism, however, is not the only cause of gumming, for certain fungi are known to induce similar exudations from Cherry trees.

The bacterium attacks young trees, and the production of gum is most manifest in spring. The bark alone is attacked, profuse gumming occurring at the affected parts. Death eventually ensues through the "ringing" of the tree by the spread of these areas, though the process is a comparatively slow one. In the absence of combative measures it is only rarely that a tree once

the cavities of the vessels, the walls are discoloured, and mobile bacteria are present in the vessels, from the cut ends of which a blackish liquid often exudes.

The organism causing the disease has been isolated from different parts of the plant, and injection from cultures rapidly induces the characteristic symptoms of the disease.

It is a rod-shaped bacterium, occurring in two's or three's, or often in long chains, the rods being themselves of considerable length. Movements of a rapid swimming or "darting" kind are exhibited.

The bacillus does not appear to be identical with any species yet described. It closely resembles *B. phytophthoræ*, but differs in several critical features. It is regarded, therefore, as a distinct species, for which the name *Bacillus melanogæ* is suggested. It is extremely pathogenic to the Potato, and retains its virulence for a long time in culture. It is worth noting that when the disease occurs early in the season, the diseased plants die, and subsequent growth of neighbouring healthy plants may obliterate the gaps so caused, so that the crop, later in the season, appears an entirely healthy one.

Plants attacked late may produce tubers

THROUGH LITTLE NAMAQUALAND WITH THE VASCULUM AND THE CAMERA.*

(Concluded from p. 191.)

THE lower course of the Orange River lies in a valley of desolation. The mountains of the Gariepinet† wall become successively lower and more barren towards the river; along a broad belt, one margin of which meets the bush which fringes the high-water‡ mark, the other being 1,000 or 1,500 feet above it, vegetation is exceedingly scarce. The scenery of this desert zone is bold and very characteristic (see fig. 97). The mountains rise steeply from the strip of sand or alluvial gravel which forms the river bank; in some places their bases plunge so abruptly into the water, that neither plant nor animal can find a foothold; their rough, rock-strewn slopes harbour plants only here and there in exceptionally favourable crevices; their summits cut the sky in sharply-toothed ridges; they are separated by narrow, winding gorges, which imprison the dry, sandy beds of periodically tributary streams. And the whole surface reflects the intense sunlight as a blinding glitter. The violent winds which sweep up the valley day after day during the summer carry with them an immense amount

the north, the rainfall is normally below the minimum necessary for the support of any but desert types of vegetation. This applies mainly to the mountain slopes. The sandy river-beds are well known to possess a fairly constant supply of subterranean water, derived partly from the eastern plateau, and to a small extent no doubt by infiltration from the permanent stream of the Orange River.

The plants found on the hills near Bethany Drift, are for the most part, species identical with or allied to those of the Namaqualand Mountain ranges. It has been pointed out elsewhere§ that higher up, at Raman's Drift for example, where the river-bed is enclosed between high and precipitous walls of rock, there occur certain species which are found also in the tropical desert regions of Damaraland. Conspicuous among these is the large and striking *Euphorbia*, which Paterson|| figured as *E. virosa*. At Bethany Drift the country on both sides is more open, the prevailing temperatures are no doubt lower, and therefore tropical species constitute a less marked feature of the vegetation, many of them (among these apparently the *Euphorbia*) being absent altogether.

In the minor river-beds, on the other hand, there are found a number of species which seem to belong to Bushmanland, or to the sandy plains of the Kalahari, rather than to the Montane region of Namaqualand. These include some shrubby *Asclepiads*, *Sisymbrium* spartea, species of *Acanthaceæ*, *Cucurbitacæ*, and a few annuals.

The characteristic Namaqualand *Aloë* (*A. dichotoma*) flourishes exceedingly in the ravines a few hundred feet above the river, where its gaunt and spectral habit but intensifies the forlorn and forbidding aspect of the surrounding wilderness (see fig. 98). A comparison with the mounted figure in the illustration indicates the great height to which these trees frequently attain in these situations. It is probable that taller specimens occur but rarely in the stretch of a thousand miles, north and south, through which this species ranges. Side by side with it, perhaps in even greater abundance, there occurs a bushy *Aloë* (see fig. 98) whose relationship to *A. dichotoma* is not at first obvious. But a close examination of its bark, the branching of the stem, and the characters of its foliage, leaves no room for doubt that they are very closely allied. The bush is very characteristic of the lower hills of the Richtersveld, but the southern limit of its range is not more than 20 miles north of Annenous. Young plants of both tree and bush appear to be equally rare.¶ It is significant that the Hottentot does not distinguish between them, but calls them by the same name "Kokerboom." And, indeed, although the flowers of the bush have not been seen, they may quite confidently be referred to the same species. Their differences in habit depend upon the stage of the development of the stem at which branching occurs, and the extent of the branching. In the one case the branches are few, and the main stem does not fork until its summit stands some feet above the ground; in the other, branching begins as soon as the stem apex reaches the surface, and a very dense branch system is produced.

A stretch of the Orange River between Bethany and Skates Drifts is shown in fig. 99. The stream turns to the north in front of the hill seen in the background (Jackals Berg). The dense bush which clothes the banks is identical in composition with that found 50 miles further up-stream**; in fact, it is probably very uniform for some hundreds of miles from the mouth. *Salix capensis* and *Zizyphus mucronata*, which are dominant species at Bethany Drift and Raman's Drift, are equally conspicuous at the point where the river is crossed by the main line to Kimberley.

§ Pearson. *The Geographical Journal*, 1910, p. 494.

|| Paterson. *A Narrative of Four Journeys, &c.* London, 1779.

¶ Old plants of both are growing in the Municipal Gardens at Cape Town.

** *Gardeners' Chronicle*, December, 1909, p. 370.

FIG. 97.—NEAR BETHANY DRIFT.

The Orange River is beyond the limits of the picture on the right. A few trees of the Bastard Ebony (*Euclea Pseudebenus*) are seen in a tributary stream bed. The small round bushes are mostly *Euphorbias*.

which become infected, and constitute an easy means of spreading the disease if used as "sets."

The disease can be transferred to other plants, e.g., Turnip and Parsnip, and some farmers are inclined to connect rotting of Turnips with that of Potatoes. There is a possibility that bacterial diseases of these plants may also be due to this organism.

The damage due to this disease is not easy to estimate. Part of the loss occurs in the field, affected plants producing no tubers, or these are diseased, and rot after being lifted. The loss is probably always greatest after the Potatoes have been lifted and stored in clamps, and it has been determined experimentally that healthy, unwounded tubers can be infected by contact. So far, it has not been found possible to isolate the organism from the soil, or to prove that this is the source of infection, nor has any means of sterilising "seed" Potatoes by heat proved effectual. Further experiments in this direction are in progress.

(To be continued.)

of sand, sometimes of particles too large to be called sand, and make life a burden. Exposed surfaces are swept bare and polished. On the lee side of every bush or protruding stone there lies a long and dwindling ridge of sand recalling a miniature snowdrift.

In seeking to account for the poverty of the vegetation, we must allow to these winds no small degree of importance. Another factor doubtless owes its origin to the relatively low elevation of the surrounding hills. Along the lower course of the river there are few sufficiently high to condense the little moisture present in the air, and consequently, outside the spheres of influence of such great masses as the Khamiesberg on the south and the Karasberg on

* Being some notes on the Percy Sladen Memorial Expedition to the Orange River, 1910-11. This expedition was assisted by a grant from the Royal Society.

† G. Thompson. *Travels and Adventures in Southern Africa*. London: 1827. (The Orange River was formerly known as the "Gariet.")

‡ The river is not tidal at Bethany Drift. Its level, however, fluctuates with the rainfall in the Transvaal and the Drakensberg.

It was pointed out in the first of these articles that, although the summer-flowering season increases in importance from south to north, yet throughout Namaqualand the great bulk of the species flower in the spring months.

These scattered notes have been concerned with the summer vegetation, but the few words in which the late Dr. Bolus so vividly clothes a general impression of the spring flowers in the neighbourhood of Annenous may fitly be quoted: "I was amazed on visiting that desert country after the rains of June to July, 1883, to see tracts, hundreds of acres in extent, covered with sheets of living fire or glowing purple, visible from several miles distance, caused by the beautiful Compositæ in flower, and nothing is more singular than to see this luxuriance intermingled with the black or white branches of dead shrubs killed by previous droughts, standing like ghostly intruders on a scene of merriment and joy. These charming displays pass away all too rapidly, and in a month or two little that is beautiful remains."††

But whether in January or September, whether the vegetation is dormant or active, Namaqualand offers a rich field for botanical investigation.

so, we shall perhaps be forced to see in the present vegetation of Namaqualand the results of a long series of climatic changes which are still in progress, and which may, in the long run, profoundly affect the economic future of Western South Africa—and the more speedily if the ravages of the goat and the veldt-fire remain unchecked. H. H. W. P.

THE PRIMULAS OF THE EUROPEAN ALPS.

(Continued from p. 164.)

HYBRIDS.—III.

P. hirsuta × *P. viscosa* = *P. Berninae* (Kerner: *P. Salisii*, of Brügger).—A very handsome and recognisable cross, producing secondary hybrids also. It is generically intermediate, smaller in habit, but otherwise resembling *P. viscosa*, though with flowers fewer, larger, wider, approaching those of *P. hirsuta*, but with the typical purplish and powdered throat of *P. viscosa*. *P. Berninae* is not uncommon with its parents in the Bernina Chain and the Bergamask Alps.

marginata. The influence of this latter I suspect in the plant in question, only because of the outstanding, almost rectangular dentation of the leaves (which, however, are soft, glandular, totally efarinose, and emarginate), and the shape and colour of the flowers, which are fewer in the umbel, larger, and wider than those of *P. viscosa* in any form, and of a brilliant blue-lavender colour, such as certainly suggests the characteristic note of *P. marginata*.

P. farinosa × *P. marginata* = *P. Bonatii* (Petitmengin).—This wild and paradoxical cross was described and reported by the late M. Petitmengin as occurring occasionally on the northern side of the Col de la Croix Range in the Cottian Alps. The plant, I think, is otherwise unknown. There is hardly any parallel to this alliance between species so remote.

P. hirsuta × *P. integrifolia* = *P. Heeri* (Brügger). It is necessary to discard the following names: *P. Davosiana*, *P. assimilis*, *P. Lageri*, *P. Thomasiana*, *P. incerta*, *P. globulariæfolia*, *P. montafoniensis*, and *P. Trisannæ*.—This, in type, is a truly magnificent little plant, intermediate, and yet very distinct. Its flowers are much larger and more brilliant than those of *P. hirsuta*, carried on short stems, above light-green leaves, usually denticulate, more or less lucent, and yet hairy. The leaves alone would differentiate it from the smooth, entire-leaved *P. integrifolia*; the much larger flowers, with (usually) coloured throat and tube, from *P. hirsuta*. This lovely (but sterile?) hybrid occurs in the Bernina Chain and in the Pyrenees (the only Pyrenean Primulas being *P. viscosa*, *P. integrifolia*, *P. hirsuta*, and the universal *P. farinosa*).

P. integrifolia × *P. viscosa* = *P. Dinyana* (Lagger) differs from *P. integrifolia* in its narrower, denticulate leaves, more or less pilose, in taller flower-scapes, richer in flowers, on longer pedicels, often nodding, powdered, but not villous at the throat; from *P. viscosa* in larger, fewer flowers, longer bracts, bigger calyx, smaller capsule. This cross approaches, as usual, to its mother plant, *P. integrifolia*. Its flowers are of a heavy red-violet, and it dwells with its progenitors in the Bernina Chain, being not uncommon.

P. viscosa × *P. integrifolia* = *P. Murettiana* (Moritzi: *P. Murettii* of Charpentier).—This, the reverse cross, exactly repeats the characters of the last, but the other way round, being larger in habit, rather smaller in flower, and closer in general resemblance to *P. viscosa*. It occupies, naturally, the same districts as its parents and *P. Dinyana*.

(There are, no doubt, reverse crosses to many, if not all, of the other hybrids too. I believe myself to have seen *P. viscosa* × *P. pedemontana*, for instance; but I feel it a pity to multiply names unduly. Usually, some such system as I suggested earlier might easily prove quite sufficient to cover the crosses going each way between two species.)

P. glaucescens × *P. hirsuta* is a cross that has no name, and has only once been found (in the Val d'Ambra), and then only in one solitary fruiting stem. A doubtful hybrid.

P. tyrolensis × *P. Wulfeniana* = *P. Venzoi* (Huter).—This plant is not uncommon in gardens, where it often figures under the name of *P. cridalisensis*. (Other names to be forgotten are *P. venzoides*, *P. micrantha*, *P. adulterina*, and *P. valmenona*.) It is a taller plant than tiny *P. tyrolensis*, with more or less glaucous, glossy leaves, fairly stiff, elliptic-obovate, usually entire, with a barely perceptible margin of membrane, and a flower-scape, often of purplish tone, carrying one to three rosy-lilac flowers. *P. Wulfeniana*, on the other hand, is bigger in all parts, and has broadly-margined leaves, intensely stiff, glaucous, glossy, glabrous, and entire. Alp Valmenon, in the Venetian Range.

P. Clusiana × *P. minima* = *P. intermedia* (Portenschlag: *P. floerkeana* of Salzer; *P.*

FIG. 98.—*ALOË DICHOTOMA* IN A RAVINE NEAR DAÜNABIS, ABOUT 15 MILES SOUTH OF BETHANY DRIFT.

It is a field difficult indeed to penetrate, and many of its botanical problems are extremely complex, but it would not be easy to find a region possessing greater attractions for a botanist. Of the many questions that force themselves upon his attention none is perhaps more prominent than those concerned with the distribution of species:—the wealth—and the poverty—of the flora; the extremely limited range of many of the species, the extraordinarily extensive range of others; the remarkable power which many possess of remaining dormant through long periods; the peculiar relations between the Cape flora of the mountain tops and the very different forms of vegetation prevailing at lower elevations; the place of origin of the latter; the reasons for the retreat of the former. It is difficult to avoid the conviction that Namaqualand is the arena in which is being fought out the penultimate battle between the ancient vegetation of the mountainous coast belt of South and South-west Africa, and a horde of more xerophytic forms advancing from the north and east. If

P. pedemontana × *P. viscosa* has hitherto, so far as I am aware, no name. I will think of it as *P. Bowlesii*, remembering in whose company I first saw it on the Little Mont Cenis. It has almost the habit of *P. pedemontana*, but is much more glandular, odorous, limper in the leaf, and weaker in russet fur. Its flowers are longer in the tube than those of *P. pedemontana*, and of almost *P. viscosa*'s rich, vinous violet, but larger and much more open, though with *P. viscosa*'s typical powdered throat and purplish tube. It occurs, but not frequently, among its parents, and, of course, resembles *P. Berninae*.

P. viscosa × *P. Jansensis* = *P. Kolbiana* (Widmer).—A hybrid barely known or described, from the Val Seriana.

P. viscosa × *P. marginata*.—This, if a genuine cross, is one of the very rare instances of hybridisation between two species of the same subsection. I give it, however, no name, as the plant requires further observation. It is, in size and habit, pure *P. viscosa*, and occurs among *P. viscosa* on the Col de Clapier. Near at hand, in the neighbourhood, lives also *P.*

†† H. Bolus. *The Flora of South Africa*. Official handbook of the Cape of Good Hope. Cape Town, 1886.

Portenschlagii of Beck; *P. Wettsteinii* of Wiemann; *P. fallax*, *P. monticola*, *P. spinulosa* of Gusmus).—A very beautiful and variable little hybrid, much smaller in habit than *P. Clusiana*, but with the same enormous flowers, one to three on the short scape. It also differs from its mother in having denticulate leaves. It is much larger in habit than *P. minima*, and has no marginal band of membrane. It is said to be sterile (though this I certainly contradict), and it occurs freely with its parents on the limestone ranges round Vienna.

P. minima × *P. Wulfeniana* (*P. Deschmannii*, *P. Kankeriana*, *P. mutata*) divides into two named varieties, both differing from *P. Wulfeniana* in having serrate leaves, and from *P. minima* in larger habit. *P. × serratifolia* (Widmer = *P. serrata*, Gusmus) is known in gardens; its oblong-cuneate little leaves have seven to nine teeth; it has no flower-scape and the briefest of pedicels. (Carinthia.) *P. × vohicnensis* (Widmer) has a short scape, and its oblong leaves are sometimes entire, but usually have one to three teeth. (Carinthia.)

P. minima × *P. spectabilis* (*P. fratisensis*, *P. Fumana*, *P. Valbonæ*, *P. varians*) is another hybrid needlessly split up under two names:—*P. × Dumoulinii* (Stein), a little plant, one-flowered, with scape shorter than the leaves, which are wedge-shaped, barely truncate at the end, and serrate-dentate. Nearest to *P. minima*. (Southern Judicaria.) *P. × Facchinii* (Pax and Schott, = *P. floerkeana* of Facchini; *P. magiasonica* of Porta) is bigger than the last, with two (instead of one) immense flowers to a taller scape, and ovate-rhomboid leaves, denticulated from their middle to the end. Same range as the last, but less rare. Reginald Farrer.

(To be concluded.)

EUROPEAN ELMS.*

THERE are in all Europe four species of Elm trees that can be readily distinguished. The confusion in regard to these trees goes back at least to the time of Linnæus, who considered that all the European Elms belonged to one species, to which he gave the name of *campestris*. This name, however, cannot be used for any one of the four species united by Linnæus, as it is impossible to know which of the four he considered best deserving of the name. *Ulmus campestris*, therefore, as a name must be given up. This is unfortunate, for the name is of old usage, and is found in all books about trees.

Two Elm trees grow naturally and spontaneously in Great Britain, *Ulmus glabra* and *Ulmus nitens*, and these names, which are the oldest which have been applied to these trees, further complicate the situation. *Ulmus glabra*, which is often called the Scotch Elm, is a medium-sized, round-headed tree, with stout, hairy branchlets, and large, short-stalked leaves, often three-lobed at the apex, and very rough, especially on the upper side, from the short, rigid hairs which cover them. This tree can easily be distinguished also by the fruit in which the seed is in the centre of the surrounding wing. It is a native of Scotland and northern England, and extends eastward to the Caucasus, eastern Siberia, and Japan, where it is represented by a distinct form, the variety *heterophylla*. To the Scotch Elm several names have been given. The oldest and the one, therefore, which should be adopted, is *Ulmus glabra*. This is an unfortunate name, for the leaves are rougher than those of any other Elm tree, and *Ulmus scabra* and *Ulmus montana*, which were given to it later, are more appropriate names. The name *glabra*, however, as the author who first used it states, was given to this tree because the branches are smooth, that is, because they do not produce the corky wings which are developed on the branches of many varieties of Elm trees. The Scotch Elm

has been sometimes planted in the eastern United States, but it is not a desirable tree. It does not produce suckers like many other Old World Elms, but it bears great quantities of seeds, which are freely blown about, and, growing rapidly, produce innumerable plants, which may become troublesome weeds. In recent years, in the neighbourhood of Boston, the leaves of this tree have been destroyed in early summer by the larvæ of a leaf-mining insect, which works entirely under the epidermis of the leaf, and cannot, therefore, be reached by an external application of poison. This insect is a good botanist, and, selecting always this Elm, never feeds on any of the other species. Several varieties of the Scotch Elm are commonly cultivated. The best known, perhaps, is the Camperdown Elm, the variety *Camperdownii*. This is the tree with pendulous branches which is often planted in suburban gardens, where, as the branches grow regularly round the top of the stem and reach the ground, it makes a natural arbor. The variety *horizontalis*, with irregularly-spreading and more or less drooping branches, is a handsome tree, but is less often seen in the United

by American cultivators of trees. There are several forms of this tree in cultivation. Perhaps the one most often seen is the variety in which the leaves are blotched with white, variety *variegata*, also called *argenteo-variegata*. The Cornish Elm, with erect-growing branches, forming a narrow, irregular head, is a variety of this tree. There is a variety with purple leaves, var. *purpurea*, sometimes called var. *corylifolia purpurea*; and there is an interesting form found a few years ago in Persia, the variety *umbraculifera*, with short branches, forming a compact, nearly globose head.

The third European species, *Ulmus lævis*, is found only in the northern part of the continent, and is the commonest Elm of Scandinavia and northern Russia. This is a noble tree, which sometimes grows to the height of 100 feet, and is hardly distinguishable in habit and foliage from the American Elm, although quite different from our tree in the long stems on which the flowers and fruit hang. Like the American Elm, the trunk and large branches are often clothed with small, pendulous branches. This tree is probably extremely rare in American collections,

FIG. 99.—THE ORANGE RIVER BETWEEN BETHANY AND SKATES DRIFTS, LOOKING DOWN-STREAM.

An overhanging tree of *Salix capensis* on the left; this species is the most abundant constituent of the bush fringing the banks. The hill, "Jackalsberg," in the background, rises to 1,100 feet above sea-level.

(See p. 200.)

States. The Exeter Elm is a variety of this tree, var. *stricta*, with erect branches, which forms a narrow, pyramidal head, and is more curious than ornamental. The variety *macrophylla* is a form with exceptionally large leaves, and the variety *myrtifolia* has purplish leaves. The variety *superba*, which is, perhaps, a hybrid, is a large tree, with a broad head of pendulous branches, and large, rather lustrous leaves, and is the handsomest of all the forms of the Scotch Elm.

The second species which grows in Great Britain, *Ulmus nitens*, is a taller tree, with slender, hairless branches, sometimes furnished with corky wings, longer-stalked and smaller, smooth, shining leaves, without hairs, except occasionally on the under surface of the midribs, and fruit in which the seed is near the upper edge of the encircling wing. This tree produces suckers freely. It is a widely-distributed tree, extending to the Caucasus and Siberia. It is not often found in American collections, and it is hardly recognised

although it might well be more often planted in the northern states. It is often called *Ulmus pedunculata* and *Ulmus effusa*.

The fourth European species merged by Linnæus in his *Ulmus campestris* is a tree from central and northern Europe, for which the oldest name is probably *Ulmus foliacea*. This is a tall tree, with slender branches, often developing corky wings, small, smooth, or rough leaves, and fruit in which the seed is near the middle of the wing or between the middle and the apex. This tree is not generally recognised in American collections, but it is usually *Ulmus foliacea* which comes to this country when seedling Elms, under the name of *Ulmus campestris*, are imported from French or German nurseries. The curious, dwarfed, small-leaved Elm called *Ulmus viminalis* is evidently a seedling variety of this species.

The Huntington Elm, *Ulmus vegeta*, is now believed to be a hybrid between *Ulmus glabra* and *Ulmus montana*, the two species which grow

* Reprinted from *Bulletin of Popular Information* (No. 11), Arnold Arboretum, Jamaica Plain, Massachusetts, U.S.A.

naturally in England, where the Huntington Elm originated. It is a large tree, with a short trunk, and numerous large branches, spreading at narrow angles, and in this country it grows more rapidly than any other Elm tree. It should be oftener planted here. *Ulmus major*, which is supposed to be a hybrid of the same parentage as *Ulmus vegeta*, is another noble tree, which 100 or 150 years ago was much planted in the suburbs of London. There is another Elm in Europe which is, perhaps, a hybrid, but its parentage is uncertain, and it appears to be without an authentic name. This is the Elm which is planted in all the Dutch cities, and, judging by its appearance, it is one of the best of all street trees. There are large trees in Holland, in the Champs Elysées in Paris, and at Versailles, so if it is a hybrid it is not of recent date.

When in Massachusetts we speak of *Ulmus campestris*, we do not refer to any of the trees already mentioned in this *Bulletin*, but to the so-called Elm of the roadsides, avenues, and hedges in southern England. The origin of this tree is obscure. Growing spontaneously, it is known only in England; it never ripens seeds, and it increases by suckers, which are produced in profusion. Some authors have thought that it might be a hybrid; by others it has been suggested that it was brought from Italy to Britain by the Romans. It is a splendid, tall, long-lived tree, with a massive trunk and erect or spreading branches. This is a tree which has grown to a larger size in Boston and its suburbs than any other planted tree. Major Paddock established a nursery of these trees at Milton, in the 18th century, and the Paddock Elms, once the glory of Tremont Street, and the so-called English Elm trees, which once stood on Boston Common, are of this form. The oldest name for this tree is *Ulmus surculosa*. All these Elms, and many other species, hybrids and varieties in small individuals, can be seen on the north-eastern slope of Bussey Hill. *Ulmus surculosa* is common near Boston. *Ulmus glabra* and some of its varieties are not uncommon in this neighbourhood, and occasionally plants of *Ulmus nitens* and *Ulmus foliacea* can be found in eastern Massachusetts. As these last are usually raised from seeds in European nurseries, the imported seedling plants show great variation in habit, foliage, and in the presence and absence of wings on the branchlets.

PLANT NOTE.

HIBISCUS.

THERE was a time when the members of the genus *Hibiscus* were more generally employed for garden decoration than is the case to-day, when, indeed, there were but few collections of stove plants which did not contain one or more of the many varieties of *Hibiscus rosa-sinensis*. One of the best and most easily grown for greenhouse decoration is *H. Manihot*, a tender perennial, most successfully grown and flowered as an annual, plants from an early sowing growing 6 feet high the first season. The flowers are large, when fully expanded being almost flat and 6 inches in diameter, cream-coloured, shading to yellow at the base of the petals where each is splashed with black, the whole, with the conspicuous staminal column, being very effective. The flowers are produced solitary from the axils of the leaves. They are short-lived, lasting but for one day; a batch of plants will, however, produce fresh flowers daily and over a long period. Their cultural requirements are simple; the seeds should be sown in a brisk heat early in the year, and the seedlings potted on and hardened as growth proceeds, their final potting being into pots 9 inches in diameter, at which stage they may be accommodated in an unheated house. They are gross feeders, and when established should be fed regularly. Seeds are produced freely, each capsule containing 60 seeds or more. *Fred. W. Jeffery, Woodend Gardens, Renfrewshire.*

THE WEATHER AND AQUATIC PLANTS.

As might be expected, the prolonged tropical sunshine has suited the out-door Waterlilies. At the early summer fortnightly exhibitions of the Royal Horticultural Society, and at the Olympia Show, several trade growers exhibited gigantic flowers of various *Nymphæas* bearing large, fleshy petals of rich colours. Whenever these plants have received the little attention they require, there has been a rich harvest of delightful flowers, which have remained open nearly the whole day long. When making comparisons between the blooms seen at flower shows and those which are growing in ponds, or other places, due allowance must be made for surroundings. A number of cut flowers floating in a comparatively small receptacle of water quite near to the observer, appear to greater advantage than when the flowers are growing in a pond or tank, and are at the least several feet away from the eye. Visitors to flower shows who overlook this point are apt to be dissatisfied with their own flowers.

Usually the *Nymphæas* throw up an undue proportion of leaves, which, to enable the flowers to be properly seen, have to be frequently thinned out. But this year much of this labour has been obviated and, due to the great heat, the flowers have been, in many cases, raised well above the surface of the water. But the closely related *Nuphars* do not seem to have benefited so much from the great heat. In many instances these plants have completed their blossoming at an unusually early date. For planting away from the banks of large ponds the *Nuphars* are in several respects preferable to the common *Nymphæa* (*N. alba*). The orange-yellow flowers are brighter—white is "cold," and less attractive when surrounded by much water or greenery;—the leaves of the *Nuphar*, which are much handsomer, stand well out of the water, giving it a well-furnished appearance, and when they decay, do not look so unsightly as does the decaying foliage of the *Nymphæas*.

During the middle portions of the tropical days in midsummer the heat was plainly too much for the pretty yellow-flowered *Limnanthemum peltatum*, for, whilst the *Nymphæas* rioted and revelled in the great heat, the more delicate petals of this plant were greatly distressed. It was interesting to notice how they gradually recovered as the evening approached. In a temperature up to 83°, the *Limnanthemum* (better known perhaps as *Villarsia*) was perfectly happy, but beyond this point the flowers gradually flagged.

Pontederia cordata is still wonderfully handsome. There is so much body in the spikes of rich blue flowers; one cannot think of any other hardy blue flower which surpasses it in depth of colour. The dense spikes, and exceedingly rich blue colour, are somewhat reminiscent of the compact shrubby *Veronica*, as it grows and blooms in the western counties. A common mistake made with the *Limnanthemum* is that of planting the roots too deeply. Provided they are covered with sufficient water to escape being frozen in the winter, the nearer they are to the surface the better.

The Arrow-heads (*Sagittaria*) are now nearly over; somehow we expect a rather more showy flower from such fine foliage. The flowering Rush (*Butomus umbellatus*) has had a fine season, the plants have pushed up many large spikes of lovely pink flowers, and some yet remain. This is another aquatic which should not be placed in deep water. The Amphibious Willow Grass (*Polygonum amphibium*) is bearing numerous short spikes of red-tinted flowers. Like some other similar plants, it is interesting on account of the distinct foliage it produces when growing on drier ground. The native purple Loosestrife is known to almost everyone; a pretty little companion plant is *Ammania japonica*, which might well be described as being a half-sized *Lythrum Salicaria*, its erect, purple spikes being only from 18 inches to 2 feet high. *Teucrium*

Scordium is another uncommon water-side plant. It does not possess any showy attributes, but is sufficiently pretty and distinct as to be well worth planting in the shallow margin. *Senecio paludosus*, a strange-looking groundsel, is useful for a similar purpose. It has an erect, compact habit, and grows quite 4 feet high. Before the flowers open *Discopleura Nuttallii* possesses the richest green foliage of any of the water-plants now in season. The plant grows about 18 inches high, and compact umbels of small, white flowers surmount the finely-divided, dark-green leaves.

The Giant Horsetail, *Equisetum maximum*, although a native plant, and a pest in some places, is deserving of culture by the water-side. When well-grown the curiously-whorled stalks become fully 5 feet high, and supply a very distinct form of foliage. When under cultivation this plant is often allowed to become a dense mass of shoots, in which condition it is not so ornamental as when each growth stands clear of its fellows. *Hippurus vulgaris*, the Marestail, is more ornamental than the *Equisetums*. The growths are not nearly so tall, but the pretty little feathery spikes of rich, dark-green are very attractive. *A. C. Bartlett.*

TREES AND SHRUBS.

MAGNOLIA MACROPHYLLA.

It is but seldom that a really good specimen of this noble *Magnolia* is seen, for although it is suitable for outdoor culture in the southern and western counties, it does not appear to have been planted in many gardens. One of the finest known trees is growing in the gardens at Claremont, whilst for many years a good-sized tree flowered annually in Messrs. Veitch's nursery at Coombe Wood. Considerable information about the tree in its natural habitat is to be found in Professor Sargent's *Silva of North America*. It is a native of the South United States, but does not appear to be a common tree there. Its maximum dimensions are attained in a deep rich soil in sheltered valleys in North Alabama, where it is found from 30 feet to 50 feet in height, with a trunk diameter up to 18 inches or 20 inches. The oblong leaves grow to a remarkable size, being sometimes 2½ feet long and 9 inches or 10 inches in width. The upper surface is bright green and glabrous, whilst the under surface is glaucous and pubescent. The creamy-white flowers appear in June and July. They are 9 inches to 12 inches across when fully expanded, and like the flowers of many of the other *Magnolias*, very fragrant. When planting this species a sheltered position in rich, well-drained ground should be chosen; if the ground is not naturally peaty, a little peat should be added to the soil.

ILEX FARGESII.

ALTHOUGH this remarkable Holly has been known from herbarium specimens for a considerable period, it is only of late years that living plants have been cultivated in English gardens. It is one of the many plants introduced by Mr. E. H. Wilson from Western China when plant collecting for Messrs. J. Veitch & Sons. The plant attains a maximum height in China of 15 feet; whether specimens will grow so high in this country remains to be seen. At present it is inclined to grow in width rather than in height, the branches being long, thin, and clothed with evergreen leaves measuring 3 inches to 4 inches in length and ½ inch to ¾ inch in width. They are dark green above, and lighter on the under surface. The margins are armed with a few saw-like teeth, which are not, however, spines. From dried specimens the fruits are seen in small clusters, arising from the leaf axils; when ripe they are red in colour. *I. Fargesii* is perfectly hardy and likely to thrive under conditions suitable to the common Holly. *W. Dallimore.*

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

TOMATOS.—The foliage should be reduced and all side shoots removed from Tomatos out-of-doors in order to hasten the ripening of the crop. Give frequent applications of liquid manure to assist the plants to mature their fruits. Tomato plants in pots intended for fruiting in early winter should have several bunches of fruit set at this date, and must be removed to glasshouse where fresh air can be admitted both night and day. A little extra growth should be allowed to remain on Tomato plants during autumn and winter in order to keep the roots in an active, healthy condition. Plants intended for furnishing the latest supplies of fruits should be ready for their final potting; make every effort to secure a full set of fruits by the end of October. Employ 8-inch pots and light, turfy loam with a sprinkling of rough sand to keep the soil in a porous condition. Fresh air should be admitted freely both night and day until sufficient fruits are set.

SPRING CABBAGES.—Plants of the first sowing will be ready for planting permanently. The ground for this crop should be in a good condition, but it is not advisable to apply fresh manure at the time of planting; better results will be obtained by planting on ground which has been heavily manured for a previous crop. The soil should be made moderately firm, and the plants put out in drills drawn 15 inches apart, allowing a distance of 1 foot between the plants in the row. Give liberal supplies of clear water at the time of planting to settle the soil about the roots. The principal plantation of Spring Cabbages may be made a fortnight later.

FRENCH BEANS.—Make a sowing of French Beans in pots weekly, to furnish plants for providing a supply of pods during November. Winter vegetables in the open will be scarce this season, therefore every effort should be made to grow as many Beans and other tender vegetables under glass as possible. Pots having a diameter of 8 inches should be used for this sowing, but, as the season advances receptacles a size smaller may be used with advantage. The compost may consist of turfy loam mixed with a small quantity of well decomposed manure. Fill the pots to within 2 inches of the rims and make the soil moderately firm; six seeds may be placed in each pot and covered one inch deep with fine soil. The pots may be placed in a cool glass-house until the seedlings are well above the surface, when they should be removed to a position within 18 inches of the roof-glass to prevent the plants becoming drawn. Admit air freely and give liberal supplies of water at the roots, for if the soil is allowed to become dry the chances of a remunerative crop will be spoiled. As they develop, the plants will require support, which may be afforded by twigs inserted near the rim of the pot. Give frequent applications of liquid manure and syringe the foliage twice daily during bright weather. Ne Plus Ultra and The Belfast are suitable varieties for this sowing; the latter is of recent introduction and is largely cultivated at Fregmore to furnish pods for cooking whole.

MUSHROOMS.—Continue to collect horse droppings for providing successional beds, placing the manure in an open shed, where it may be turned frequently, to prevent it becoming sour. Beds spawned at this date should furnish Mushrooms in about six or seven weeks. The bed should be at least 15 inches deep after the manure has been rammed tightly, as this quantity of manure is necessary to maintain a temperature of 80° for some time after the bed has been spawned. When danger from overheating is past, the surface of the bed should be covered with a one-inch layer of fine, new loam, which should be beaten as firmly as possible with the back of a spade. Finally, a light covering of straw should be spread over the bed to prevent evaporation of moisture. Beds that were spawned a month ago

should be examined and, if the surface is found to be dry, given a gentle watering with soft water. Syringe the walls and floor of the house frequently, so long as the weather remains fine and dry.

CELERY.—The main crop of Celery will now require earthing-up. A thorough soaking of water should be applied to the roots before the soil is placed in position. All side shoots and small leaves should be removed before the plants are tied with some soft material, which must be removed after the earthing-up has been done. The soil should be broken as finely as possible, as the work proceeds, and it must not be allowed to fall into the hearts of the plants. It is of great importance that the plants of successional batches of Celery do not suffer from want of water at the roots or the heads will be inferior.

HOEING.—The soil where the crops are growing should be hoed as frequently as possible whilst the dry weather continues, in order to destroy small weeds before the autumn rains occur. Asparagus beds should be hoed carefully and the main growths secured to wires or sticks before high winds occur. Asparagus plants intended for forcing in pits will be benefited by a soaking of manure water at the roots before the foliage commences to turn yellow.

PLANTS UNDER GLASS.

By JAMES HUDSON, Gardener to LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, Middlesex.

THE GREENHOUSE.—The autumn sales afford a good opportunity for replenishing the stock of greenhouse plants with young, healthy specimens. Excellent plants of Bouvardias may be purchased at about this date, and, in all probability, the plants purchased will be showing their flowers. If the blooms are not required for a few weeks to come, the early inflorescences should be pinched off, and, if in 4½-inch pots, the plants may be shifted, with advantage, into receptacles a size larger. By growing them in a warm pit where the atmosphere is kept moist, and placing them near to the roof-glass, fresh growth will soon develop that will blossom at a season when flowers are scarce. Cytisus racemosus is another plant that may be treated in this manner, there being plenty of time before the dull season arrives for the plants to recover from root disturbance. But whatever subject is potted just now, guard against over-potting, and, in all cases, pay special attention to the watering. In the case of hard-wooded plants, such as Heaths, Epacrises, Boronias, Acacias, and Rhododendron indicum (Indian Azaleas), potting will not be necessary; their chief requirement just now is a proper supply of water, for if they are allowed to become dry at the roots, they will show the effects later. If Erica hyemalis is allowed to become dry, the flower-buds will turn yellow, and, perhaps, drop, or if they are advanced beyond the bud stage they will be crippled. Any plants of the kinds I have named showing a disposition to grow freely should have the tips of the leading shoots pulled out just below the flower-buds. They may all be allowed to remain out-of-doors in gardens in southern and midland counties for a few weeks, but in the north it will be advisable to place them in pits or in well-ventilated houses, where they need not be shaded. I prefer to house them in pits, standing the pots on a bed of ashes.

POT ROSES.—The stock of pot Roses intended for forcing should be overhauled, and, if necessary, fresh plants added. It is advisable to renew a few of the plants every season, as some are sure to have deteriorated. The season has suited pot Roses, and the new plants should be secured without delay. I have always obtained the best results with plants that were potted in September, whilst the foliage was still on them; early potting allows plenty of time for fresh roots to form before winter sets in. For potting, select the best turfy loam obtainable, and mix with it some well-decayed manure, or, failing that, bonemeal. Road scrapings are also suitable for adding to the soil, but be careful they are not obtained from roads treated with any kind of tar composition. Reduce the old mass of soil, taking care not to damage the

roots. Do not use larger pots, unless the vigour of the plant calls for increased root room. Many persons do not consider it desirable to repot Roses soon after they have been received from the nursery; if the soil is in a proper condition and the general condition of the plants satisfactory it is not necessary. After the plants have been potted, they should be plunged in a bed of ashes to the rims of the pots and exposed to full sunshine. One good watering after the potting is finished will afford sufficient moisture for some considerable time to come.

ROSES IN BORDERS.—Plants that have been allowed to grow freely should now be thinned carefully, removing the weaker growths. Great care should be taken to keep the plants dormant, and this condition will be best secured by keeping the roots moderately dry and the glass-house as cool as possible. The syringe, however, must be used freely to prevent red spider. Whilst the houses are fairly empty of other plants, the borders may be seen to and either renewed or enriched, as is necessary. Preparations may also be made for planting later in the season, the soil being now in the best condition for this work.

FRUITS UNDER GLASS.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

PEACHES.—When the fruits of late varieties of Peaches have been gathered, it may be necessary, if the shoots are very numerous, to remove the old fruiting branches, so that growths of the current season may become matured. The earliest opportunity should also be taken of giving the foliage a vigorous syringing with water to destroy any red spider that may be present. Give the borders a soaking of water, and, if the trees have borne a large crop and show signs of weakness in consequence, liquid manure may be applied. Early trees should also be syringed to keep the foliage healthy as long as it remains on the branches. Ventilate the house freely both day and night. When pot plants of various subjects are temporarily placed in early Peach houses, do not be led to remove any of the foliage from the Peach trees to allow more light to reach the pot plants. Any root-pruning that may be considered necessary in the case of established trees may be done before the foliage has disappeared. A trench should be made at a distance of about 3 feet from the stem of the tree, taking care to preserve all fibrous roots. The coarse roots may be severed with a sharp knife. Take out the soil as far down as the drainage materials, placing whole turves over this and filling in with the compost recommended in a previous calendar; avoid using too much manure. Make the soil thoroughly firm, after carefully placing the roots in position in some of the finer of the compost. When all is finished give a good watering. Syringe the trees, and admit an abundance of air whenever the weather is favourable.

TOMATOS.—The season has suited Tomatos, and the plants still bear a large number of unripened fruits. These should be removed as soon as they show signs of colouring and allowed to ripen on a warm shelf in a greenhouse. Some of the leaves may be removed to allow the sunlight to reach the fruits. A fresh batch of plants may now be planted, selecting those that have been growing in a cool position out-of-doors, and have commenced to set their fruits. If the plants are to be transferred from the pots and planted out in a shallow bed, as much as possible of the bare stem should be covered with soil, placing the plant in a slanting direction to allow of this being done. We have just potted a batch of Tomatos into 9-inch pots for winter fruiting. They stand in a warm house, where they will be allowed to remain for a few days to encourage them to root freely in the new compost. Afterwards they will be gradually inured to cooler and more airy conditions.

PERPETUAL-FRUITING STRAWBERRIES.—As the berries of perpetual-fruited Strawberries commence to swell, assist the plants with stimulants. Afford plenty of fresh air, and see that the plants do not suffer for want of water. The fruits are a pleasing addition to the dessert at this season.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

CYPRIPEDIUM.—The late-autumn and winter-flowering *Cypripediums* all blossom with remarkable freedom, giving them a special value during the dull season of the year. No other kind of Orchid provides such a beautiful display during that period, and the flowers last for a long time when cut. The cooler the plants can be grown without suffering injury the better they succeed, especially *C. insigne* and many of its hybrids. The flower-buds are now prominent in the new growths of many of the plants, and, with the shortening days, these Orchids should be fully exposed to the light, shading them only when strong sunshine prevails. Plenty of fresh air should be admitted by the top and bottom ventilators whenever the conditions are favourable, leaving the apertures open a little at night time in fine weather. By this treatment the leaves become sturdy and short, with much substance, and the blooms develop fine quality. Continue to give liberal supplies of water at the roots; large, root-bound specimens will be much benefited by occasional applications of weak liquid manure until the flowers commence to expand; after this stage clear water only should be given.

SEEDLINGS.—The present is a suitable time to repot seedling *Cypripediums* that have become root-bound, the cool nights and general atmospheric conditions being favourable to the plants. Any specimens approaching a flowering size should be given a more substantial compost than hitherto by adding more fibrous loam to the potting mixture. The pots must be well drained. For the rooting medium use good fibrous loam one-third, peat or *Osmunda*-fibre one third, and Oak leaves and *Sphagnum*-moss in equal parts one-third. Small seedlings may also be removed from the seed-beds, either pricking them out separately or placing several together in a small pot. For these the rooting material should consist of equal parts of peat, *Sphagnum*-moss, Oak leaves and loam-fibre, from which most of the finer particles have been shaken. Place the soil moderately firm in the pots, and to encourage the small seedlings to take root-hold quickly and without check they must be given a warm, moist and shady position, where the rooting material will keep moist with infrequent waterings, affording occasional sprayings overhead.

THE HARDY FRUIT GARDEN.

By W. HEDLEY WARREN, Aston Clinton Gardens, Buckinghamshire.
